It is a credit to the author as well the publisher, I have never yet met with a work, either French or foreign, which I like so much.—I'ABBE DU BOIS, editor of the Bulletin D' Apiculteur, France. It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended necount of the enemies of bees.—Democrat, Pulaski, N. Y.

We have perused with great pleasure this maccum of the beek-ecoper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practical to be the most counded by the press and leading becomen to be the most counded and practical

and practice as advised.—Agriculturist, Quebec,
This book is pronounced by the press and leading
ber-men to be the most complete and practical
treatise on bee-culture in Europe or America; a
scientific work on modern bee management that
every experienced bee-man will welcome, and it is
essential to every amateur in bee-culture. It is
handsomely printed, neatly bound, and is u credit
to the West.—Western Agriculturist.

The west is understable to meet complete.

handsomely printed, neatly bound, and is a credit to the West.—Western Agriculturist.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untonehed, and in the complation of the work Prof. Cook has had the advantage of all the previous knowlede of apiarists, which he uses admirably to promote and make popular this most interesting of allocaupations.—American Inventor

It may safely be pronounced the most complete and comprehensive of the several manuals which have recently appeared on the subject of bees and their handling in apiaries. The studies of the structure of the bee, the different varieties, the various bee products, and following these the points of management, extending to the smallest details, are all of high and practical value. Prof. Cook has presented the latest phases of progressive bee keeping, and writes of the themes discussed in the light of his own experience.—Pacific Rural.

Of the many excellent works which we have ex-

the light of his own experience.—Pacific Rural.

Of the many excellent works which we have examined on bee-culture, we consider Prof. Cook's the most valuable for the study of those who contemplate going into the business or are alrendy keeping bees. If thoroughly studied, and its teachings conformed to, by the apiarist, who exercises a reasonable degree of common scose, he or she cannot fail to achieve at least a reasonable degree of success. The author addresses himself to the work with a degree of enthusiasin which carries the reader with him to the end.—Kansas Farmer.

Cook's Manual of the Apiary holds in America.

the render with him to the end.—Kansas Farmer.
Cook's Manual of the Apiary holds in America
the same high rank, that is accorded in Germany
to the book of which Dzierzon is the author; the
only difference being that Prof. Cook's Manual
combines the profoundness of the German pastor
with the superiority of the practical American.
He refers in several instances to Darwin; and
does not belong to that class which hates everything that is foreign, for he speaks of German natralists with great reverence.—German Freidenker,
Milwaukee, Wis.

Entered at Chicago post office as second class matter.

#### Ruinous Competition.

As we should endeavor to draw appropriate "lessons" from transpiring events, let us try to do so from the facts presented in this and a former number, concerning the failure of some supply dealers to meet the expectations of the public.

There are many against whom no word of reproach can be heard, and who enjoy the reputation of being "reliable dealers;" but why all are not so considered is the question.

We have been accustomed to consider "competition as the life of ive bee-culture. trade," but it will be well to remember that an unremunerative rivalry is also ment's reflection will convince all that every person who transacts trade must make a legitimate profit upon what is bought and sold, in order to defray the necessary expenses connected with the carrying on of that business, as well as to pay for the time given to it.

If irresponsible parties cut these figures so much that honorable dealers cannot derive a legitimate profit, then of the dishonest, by the prudent withwill go to ruin together.

Buyers are much to blame for seekmoney, but very often have to mourn to justify fostering it.

its loss, or the non-reception of the goods ordered within a reasonable time-thus making them practically useless to him. By giving encouragement to unscrupulous dealers-sending orders for queens, bees or supplies to those who offer them at ruinous rates-bee-keepers bring upon themselves the loss of their money in many cases, and also contribute to the more disastrous result of driving honorable dealers from the business in disgust.

We are casting reflections on no individual dealer, and only wish to enforce the lesson, that getting "something for nothing" should never be expected. All should send their orders to reliable persons, and get the best. quality considered, for a fair price. If all will do this for the next season we shall hear far less complaints, and be doing our share of the work in "building up," instead of " tearing down."

The Weekly BEE JOURNAL desires to remedy this evil as much as possible, and would suggest to dealers that it would enhance the interests of the fraternity to have a standard price current, of all kinds of apiarian supplies, so that bee-keepers can buy at their nearest reliable supply depot, at the same price as at a distant point, and thus save freight and express charges. This will, in some small measure, remedy the evil, but will not cure it. That cannot be done until all the "irresponsible" dealers are forced out of the business by apiarists who will refuse to buy anything of them.

We submit these thoughts, on the events of the hour," to the earnest consideration of all interested in the welfare and development of progress-

Borage. - Robert G. Smith, Falkensometimes the death of it.  $\Lambda$  modulus, Out., writes us under date of August 25th:

Herewith inclosed you will find the flower and leaf of a plant that my bees work on from morning till night. Can you tell me the name of it? We have abundance of goldenrod, but I have not seen a bee on it yet. Will Italians work on it—mine are hybrids. Is mullein considered a good honey plant?

The flower and leaf is borage (Boago officinalis). Italian, hybrid and one of two things must happen—either | black bees should all work on goldenthe business will all go into the hands rod, and yours will probably be busy on it ere the receipt of this paper. We drawal of the honorable dealers, or all have never observed bees working on two of each to make the half dozen, mullein, and do not think much of it for honey. In some locations, and uning to find the one who cuts the figures | der certain circumstances, bees may most, and then trust him with their find a little honey in it, but not enough

#### Lecture at St. Joseph, Mo.

We have consented to give a lecture on "Bees and Honey," at the Court House in St. Joseph, under the auspices of the apiarian department of the St. Joseph (Mo.) Inter-State Exposition, on Thursday, Sept. 8, 1881, at 8 p. m. R. S. Musser, Esq., the Superintendent of the department of apiculture, seems determined not only to have a very fine display of bees, honey, apiarian implements, etc., but also to try to elevate the science and beget a progressive spirit in the honey producers of the Missouri Valley.

We hope to see a large number of the intelligent bee-keepers of the Missouri Valley at this meeting; we shall endeavor to elucidate many points of interest to those who keep bees and produce honey. Let there be a general rally.

EXCURSION RATES.—The following roads will charge passengers \(^1\)\gamma\ and from the Exposition from all to and from the Exposition from an stations on their line: Saint Joseph & Des Moines, Wabash, St. Louis & Pacific, The Kansas City, St. Joseph & Council Bluffs, Hannibal & St Joseph, St. Joseph & Western, Atchison & Nebraska, Missouri Pacific, Kansas Pacific Control Dranch, Union Pacific Pacific, Central Branch Union Pacific, Chicago, Burlington & Quincy.

The Indiana State Fair.—The premium list has been increased 20 per cent. Improvements are ordered, and every arrangement will be made for the comfort of exhibitors and visitors The Capital City will put on its holiday attire. The Public Institutions will be prepared to receive visitors during the Fair week. Railroads will, as usual, carry passengers and freight at 1/2 rates, and all combined will make the State Fair the great event of the season. Preparation days, Sept. 22, 23 and 24, so that the Fair will open and Committees on Awards begin work on Monday, Sept. 26. The increased interest is demonstrated by Can the unusual amount of applications for space and other business connected with the Fair thus early.

> Local Fairs.—Bee-keepers attending fairs this fall should have a few bee-keepers' manuals, etc., with their exhibits. When taken in 1g dozen lots by express, for this purpose, we will supply any or all kinds, or one or at 30 per cent. discount. If wanted by mail, add the postage. We do not send any "on sale or return." We will furnish copies of the BEE Jour-NAL free for distribution at fairs.

#### Taking Him at His Word.

Page 413 of Gleanings for August contains the following very singular announcement:

I agree to be responsible for my advertisers, and if Mr. Burch, or any other one, fails to send the goods, or return the money, I will pay back the amount assoon as it is determined that cannot be collected of such advertiser. It does not seem to me that I should be responsible for damages resulting from delays in filling orders.

Novice has certainly inaugurated a novel feature as a publisher, and one quite as unbusiness-like, though perhaps less reprehensible, than some of H. A. Burch & Co.'s practices. We cannot agree with Mr. Root that he is not as much morally bound to make restitution for damages occasioned by excessive delays in filling orders, as for the money actually remitted. It is easy to imagine cases wherein the latter would sink into insignificance in a comparison. But Mr. Root's whole position is not only unbusinesslike, but it is morally wrong: it shifts all legal responsibility from the contracting party; it assumes obligations without having received an equivalent; it is a temptation to buyers to relax vigilance in the settlement of private transactions; and it is an incentive to dishonest practices on the part of advertisers.

In the article above referred to Mr. Root schednles about \$400, which he virtually assumes to pay for H. A. Burch & Co.—with many more yet to hear from. It is incomprehensible to us how any sane man can establish such a business precedent. By a perusal of the correspondence below, it will be seen he has been taken at his word-not by the parties enumerated in the schedule, but by 11. A. Burch & Co. Where this matter will end, it is impossible to foretell; but how it will end can be easily imagined. The following letter is from a former correspondent on this subject:

Thave at last heard from H. A. Burch & Co., in the shape of a circular on postal card, the contents of which are as follows:

"Notwithstanding that we have labored earnestly and constantly the present season to fill all our orders, our books show that many are yet unfilled, yours being among the number. In view of what Mr. A. l. Root, of Medina, Ohio, has seen fit to say about us and our business in the July and August numbers of his Gleanings, we request you to make out a statement of your account with us and mail him at once for payment, which he will probably do, as per agreement—we will settle with him for the same. In it to us at once. Our reasons for taking Mr. Root at his word will be given you all before many months.—Îl. A. Burch & Co.''

For the most unblushing effrontery this firm, I think, will "take the cake."
Their business practices will get well aired shortly. E. E. WORTHEN. aired shortly. E. E. Wortmen. Wellsburg, W. Va., Aug. 17, 1881.

The South Haven, Mich., Sentinel copies the article from the Weekly BEE JOURNAL of Aug. 17, and then comments as follows:

Too much stress should not be put on the statement of H. A. Burch that he is working eighteen hours per day to fill orders, or on any other excuse he makes. In our next issue we will he makes. In our next issue we will give a case where he has had money since June, 1879, two years and two since June, 1869, two years and two manths, for which the remitter has not received his goods, Mr. Barch making this "eighteen hours a day" plea in July of last year. We presume the Bigg Journal and the Gleanings hope his partner (?) the "Co." part of the his partner (?) the "Co." part of the firm, will return with wealth to make good the claims of apiarists in differ-ent portions of the country. Your excuses are too thin, Master Herbert; your only excuse to be made is thorough restitution of the money, or an acknowledgment that you really are what so many people consider you.

On the other hand, Mr. G. W. Stanley, of Wyoming, N. Y., was at this office in June last, on route for South Haven, Mich., for the purpose of getting satisfaction for himself and others from Mr. Burch, or "close him up, if possible," to use his own language. He went, and on his return to New York he wrote the following to this office, according to promise, to let us know the true state of Mr. Burch's affairs:

I have arrived home at last, will tell you what success t had. When I called on Mr. Burch I found him very busy with his bees, putting up a lot to ship to a man in Indiana, and I must say they were a very line lot. I could find nothing about him in his own town to make me think he had own town to make me think he had any idea of beating any one, but, on the contrary, found that he had a great many friends, and was working from 4 o'clock in the morning until 11 or 12 at night to fill orders and to overthrow the charges of fraud that are brought no against him. True, Mr. B. is a poor man, but is doing all in his power to not only fill his orders, but to give good satisfaction to all those who send to him for goods. He had when I to him for goods. He had, when I found him, 226 colonies of bees in his yard, besides about 40 nuclei, and has a good stock of Dunham foundation and wax on hand.

I can tell you why he advertises that his bees did not die, like those of other bee-keepers, last winter (this I learned from other parties). When he sent out his circulars his bees were in fine out his circulars his bees were in time condition, but they were allowed to starve late in the spring by the man who had charge of them, and then he (Mr. Burch) had to take the money (Mr. Burch) had to take the money that was sent in and buy more to fill the orders. Of course, if all those who have ordered goods of him should claim their money at one time he could not pay them all, but he has bees and other goods such as they have ordered to fill the orders, and is doing so just as fast as he can possibly send out the goods. the goods.

Mr. Burch has more than satisfied me, and gives me a much better lot of goods than my order calls for, and when I wished the money refunded for when I wished the money refinided for one of my men, he scenned perfectly willing to do it, and paid over the amount in full. I will say that so far as I have dealt with good, honest men, II. A. Burch does not fall below the average.

case he refuses to do this, please report there prepared for war, and came keepers everywhere to preserve the away saying, "So far as I have dealt with good, honest men, H. A. Burch does not fall below the average.

> Our readers now have an outline of the whole mafter before them, and must form their own conclusions.

> Since the foregoing was placed in the hands of the printer, a subsequent letter has been received from Mr. Stanley, bearing date Aug. 22, from which we make the following extract:

> Our Burch bees are good ones, and I have no reason to complain of Burch in view of the straightforward way in which he dealt with me.

> We have received lefters, from several parties, complaining bitterly of the manner of doing business by two or three queen-breeders and supply dealers; but hope it will not be necessary to publish them.

MISCELLANEOUS.

The Uses of Honey .- A paper named Food of Health remarks as follows:

Honey can be used in lieu of sugar for almost all kinds of domestic use It has no superior in the canning and preserving of fruits, making straw-berry shortcake, etc. Many persons claim that honey disagrees with them —makes them sick. This is a mistaken —makes them sick. This is a mistaken idea and is owing to those persons having eaten honey mixed with the poison of the bee, bee bread, larve, bees, etc., as the old fashioned strained honey read to be a Part to have yet a larve. used to be. But the honey of to-day such as is produced by intelligent beekeepers, and bearing their own label pure nectar, free from all deleterious substances, and is by far the purest and most healthful sweet known. As an article for the table, both useful and ornamental, what can be superior to comb honey? This is now procured mostly in small frames and is removed from the hives as soon as it is scaled. preserving its delicate whiteness But for use in the cuisine extracted honey is superior, as it is free from wax, being thrown from the comb by centrifugal force.

How, What and When to Feed,-Mr. L. C. Root, in the American Agriculturist, says:

In most localities the season for nost localities the season for honey gathering to any great extent has now passed. Some sections will afford honey from Sweet Clover (Meli-lot), and others from Golden Rod, Aster, Eupatorium, and all fall flowers. In August Lurged the necessity of not In Angust 1 urged the necessity of not endeavoring to secure too much sur-plus, and thus leave the brood combs with too little honey for the bees to winter upon. There will be cases where the honey yield closes very ab-ruptly, when the combs will be fully occupied with brood, and the honey almost entirely stowed above in the boxes. Where this is the case, the bees must be fed. Where fall flowers are abundant, and more honey may be stored than is necessary for winter, amonty combs should be sumplied, and compty combs should be supplied, and honey stored for spring feeding.

If there are exceptional cases where from improper management, or from

causes referred to above, we find feeding necessary, what shall we feed? I answer, let it be pure honey. I have heretofore advocated the use of the best "A" sugar, but time has changed in our practice. The darker grades of honey are now so low in price that it is no longer to our interest to feed cane sugar and sell our honey.

standard of purity of honey. For this reason, I urge that no other food than honey be used for our bees. I am well aware that cane sugar may be used for wintering in such a manner that all of it rails be convenient by all of it will be consumed by the bees, but as we advance in the business, I find it desirable to feed more While so many articles of a saccharine nature are being so freely and vilely adulterated, bee-keepers should avoid even the appearance of adulteration.

See to it that each colony is supplied with a good prolific queen. It is important that all queens be of good quality nopn entering winter-quarters.

Pasture for Bees a Necessity.-Mr. W. Camm, in the Bee-Keepers' Guide,

Every season convinces me more and more that bee-keepers must sow honey plants and provide pasture for his bees, and provide if possible a suc-cession of bloom. I sowed 2 or 3 acres of mellilot this spring, on poor, clay hill points; and where sown in oats, it makes a poor show, but where the ground was roughly plowed, and the mellilot alone sown, there is a good stand. Several acres of alsike also were sown, and in moist places it will bloom this fall, but in dry spots it will make a thin stand. These with white clover and buckwheat, will make our main honey crop except where linden is abundant. As I write, late showers seem to have started the honey again and at early dawn the bees fly as though they had found honey dew. 1 sowed a good deal of mustard but its period of blooming was so brief, the bees worked upon it so few hours each day, that I shall not sow it again. Catnip and a kind of wild, white flowered mint, is erowded from morning until night, and upon mignonette they swarm all through the heat of the day. A card from the Rev. A. Salisbury, Camargo, Ill., says that his patch of 5 acres of mellilot swarms with bees from time of flowering until frost, and that it completely bridged the season from white clover till fall bloom; but of quality and quantity of yield he would not speak, as 500 colonies more or less, had pastured on his patch till the pres-

I would rather have common black bees with plenty of continuous bee bloom, than the best of Italians, Cypor Hungarians and poor bee

Management of Comb Honey .- Mrs. L. Harrison, in the Prairie Farmer, gives the following advice:

As soon as the cells are sealed, it As soon as the cens are sealed, it should be removed, so as not to get discolored with the travel of the bees. To be gilt-edged, that is No. 1. its snowy whiteness should be preserved, and whoever has this kind to sell will win the day. We know bee-keepers who let the honey remain on the hives, until frost drives the bees down into the body of the hives, for warmth. The honey that remains on during the season becomes discolored, and has not that delicate tenderness that comb honey has that was built and filled quickly, and removed as soon as completed.

In our early days of bee-keeping, we were yearly shipwrecked in the keeping of our honey, after we had followed these directions. "Why?" followed these directions. "Why?" The place we kept it in was not according to bee-lore. We tried the cellar, an upstairs closet, an airy chamber, all with the same result. The honey would sweat, get watery and ooze through the comb and run from the boxes. When it was in this continuous transfer of the comb and run from the second successive the seco the boxes. When it was in this condition we would have to put it on to the bees again for them to dry it up, which they always quickly accomplished. We did not like doing our work twice over, and in our dilemma, thought we would try the kitchen, as we had failed in every available place. We wrapped the boxes in newspaper, tied them up securely, in order to keep.

dust, smoke or flies from defacing the wood, and put on top of a cupboard all the place would hold. There was a coal fire in this room to do the cooking, and at times the thermometer stood at 100° in the shade on the adjoining porch. We flought at the time that the greatheat would melt it into a heap at the bottom of the boxes; but far from it, remaining perfectly dry it was cured. Two years afterwards a lady who had purchased a box of it, showed us a comb, saying; "I can lady who had purchased a box of it, showed us a comb, saying; "I can handle it as easily as a piece of cake—it is dry and not sticky one particle." Our experience proves to us, that to keep honey perfectly, it must be kept in a hot, dry, airy place. Other localities may differ in this respect, we have only experience in this locality.

Clover as a Fertilizer.—Discussing the mysteries of fertilization, the American Cultivator thus alludes to experiments with clover:

For the last forty years there has been no article known to agriculturists which has so largely claimed the attention of the men of science, or indirectly that of the farmer, as has nifro-gen. Theory and practice alike have confirmed the opinion that there is no more important element, either in the regetable or animal kingdom, than this, and yet how, or in what manner, or in what kind of combinations, it enters into the vegetable kingdom, we know no more than we did when the inquiry first began. We can discourse inquiry first began. We can discourse eloquently about the fertilizing qualities of Peruvian guano, we can tell how its fertilizing qualities depend on the amount of nitrogen entering into the plants and we know that clover is a wonderful fertilizer, that it leaves a large amount of nitrogen in the soil, in its roots and scattered leaves; but whether it did not accumulate the whole from the soil and present it to us in new compounds, or, through its leaves, presenting substances to the nitrogen in the atmosphere which would combine with it so that it could be carried to the soil, and made of advantage to other vegetation, we are to-day as ignorant as we were 100 years ago. But this we do know, that one kind of vegetation does furnish and prepare food for another kind, and in this way we find the practical value of

this way we find the practical value or alternating crops.

Mr. Lawes. in 1873, experimented with barley and clover. He sowed half a field with barley without manure, which had been kept in crop the "praying years" and fattliged with 3 previous years, and fertilized with artificial manures: the other half had been sown to clover the year previous. The yield of barley was 31 bushels to The yield of barrey was 31 bushers to the acre, and clover 3 tons 48 pounds per acre. The next year the whole field was sown to barley without ma-nure. The half previously in barley gave 32% bushels; the other half after clover gave 58 bushels per acre. Thus we see that after taking off a very valuable crop of clover he had increased the fertility of the soil to almost double that of the half which had been in barley. Now, without entering into any speculative theories of where into any speculative theories of where this amount of fertilizing material came from, we have the facts from which we cannot ignore that by the aid of clover the crop of barley was vastly increased. Nor can we without presumption say that this fertality was the result of nitrogen which the clover collected any more than it was the result of phoshoric acid and potash, which it had also collected,—for unless there were already accumulated in the soll these two principles emivain the soll these two principles equiva-lent to the requisitions of that amount of barley, it would have been in vain that the soil obtained through the clover the necessary amount of nitrogen.

Bee-Keepers' Union.—The Eastern New York Bee-Keepers' Union Association, will hold their eighth semi-annual Convention on Tuesday, Sept. 27, 1881, at 10 a. m., at Knowersville, N. Y. All bee-keepers are invited to attend.

#### How to Winter Bees Successfully.

JAMES HEDDON.

I have just read the prize essay of Mr. Chas. Dadant on the above sub-ject, and never before was I so struck with the difference in the actions of bees and the treatment they require, bees and the treatment they require, in different localities varying so little in latitude. In this article I will refer to some of these differences, and different conclusions arrived at therefrom. He says: "Bees in winter do not inhabit the combs which are filled with home." The reather directly be

with honey. They gather directly below the sealed honey."

Here this is true where hives are left with tight wood covers, but with the Langstroth hive the cluster rises to the cushion many times, clustering square upon solid sealed comb below, but almost universally filling the space but almost universary mining the space between the top bars and cloth above all, through the winter, passing over from comb to comb in this space (which is about 2 inches) and working forward and back through the ranges between the combs, thus being able to avail themselves of any honey the hive may contain. The quilt seems to

attract them to it.

I supposed the "water in winter"
question was either unsettled or conceded that all attempts to supply coloof glass as condensers, had failed to give any satisfactory results.

Dysentery is the only winter trouble of any moment known in this vicinity. Whatever will cause winter breeding, will tend to engender the disease. If water will do it, then let us "keep dry." Perhaps from this cause lies the success of the use of absorbents

In regard to bees being unable to reach their stores, I have demonstrated that bees cannot pass from comb to comb through passages such as they have between the ends of the frames and the hive, when the hive is contin-ually in a temperature of 42 F., but will starve with honey close to them. This being true, bees are hardly as safe in special repositories (where no special passage-room is made for them) as they are out-of-doors, unless the as they are out-or-wors, white is of continued severity. Ordinarily, many times during winter the sun strikes the hive with sufficient warmth to raise the temperature in the hive so that the bees can pass over and around the frames. Here it is calculated that 25 pounds of honey are required to sustain a normal colony from the time that they cease gather-ing until they begin again. Only about one-half of this amount is required to feed the bees during the time they are confined to the hive. But little more than one-third is used if httle more than one-tura is used a but little breeding takes place. Winter breeding, however successfully done, is of little or no value here.

That crystallizable sugar is most easily digested by the bees I have no doubt, but this fact plays but a small part in our success or failure to winter

part in our success or failure to winter our bees, in my judgment, for if they eat pollen with it, dysentery and death will be apt to result.

About twelve years ago, in the month of October, I bought 15 colonies of bees in 10-frame Langstroth hives, of a neighboring farmer. Owing to the season, these hives were almost exclusively basswood honey (the most crystallizable we have here) and in less than six weeks after putting them away all were dead with dysentery in its worst form. They were in a choice cellar. I was first led to believe from the expressions of others, that late (dark) honey was mostle for wintering (dark) honey was unsafe for wintering bees upon. Experience, coupled with bees upon. Experience, coupled with close observation, led me to believe that it was the best. I now think that the secret is this: when we have combs of fall honey we usually have them

full to the exclusion of fall pollen, and

full to the exclusion of fall pollen, and in this lies our success.

Mr. Dadant speaks of "5 or 6 weeks" as a long time for bees to be confined, but says they will stand it if the honey is pure, etc. Last winter our 74 surviving colonies were completely confined for nearly 5 months, and that, too, during spells of continued colo of a severity soldom ever known here beday a severity seldom ever known here be-fore, and a majority came through healthy and bright. All wintered out-of-doors, and a few entirely neglected.

One fall, in packing my bees, I left many with the brood cover tightly sealed, leaving no upward ventilation or absorbents above whatever. I lost about one-third of my colonies, but there was no difference in the condition of those with, and those without venof those with, and those without ven-tilation through absorbents above. Seeing no difference, I tried the same experiment the next winter, and ob-tained a decided preference in favor of the absorbents above, though a few. with no absorbents or other upward with no absorbents or other appeared ventilation, were in fine order—wintered perfectly. May it not be that whenever tight tops act as condensers, and this tends to stimulate breeding, that dysentery results?

I always objected to imprisoning

bees during winter, because the mo-ment they find out they are prisoners. they become excited to a degree that causes them to eat all sorts of food obcauses them to eat all sorts of 100d on-tainable, and unreasonable quantities of it. Next comes a statement in Mr. Dadant's article which, while I have no desire to question its being put into successful effect in his location, would be ready death here. I quote:

"Now, after a spell of more than a week of cold weather, as soon as the thermometer rises to 45- in the shade, I disturb every colony to compel their bees to fly out."

In successfully wintering bees in this climate, the first desideratum is to get the colony into that quiet, semi-dor mant state which holds success in its hands for any length of time that it remains with them. This condition our bees nearly always enter into when first closed in by cold, and every time they are disturbed and aroused to tivity, the chances for getting them back into this quiet state grow less; particularly so as the winter advances. Flights in the fore part of the winter are seldom of any benefit, not being needed; in the after part, they tend needed; in the after part, they tend to stimulate breeding, which has a tendency to destroy our bees. Re-peatedly have I noticed the evil effects of a "purifying flight." During the winter of 1874-75, I had housed about 35 colonies. Towards spring they had the dysentery badly, so much so that I lost all but 14 of them, and as the cold frame was then among the great cold frame was then among the great discoveries, I put one I had in opera-tion. I raised the mercury to the proper temperature (I think 60° or 70°), and placed under the glass, on a straw tloor, three of the diseased colonies. They were strong in numbers, and flewand voided fully and satisfactorily flewand voided fully and satisfactorily (more so than they do out-of-doors in the same length of time), and returned to the hive with scarcely any loss. I was proud of my success, and determined to put more through the next day if the sun shone, and if not, as soon as it did. Before it shone, however, those three colonies, and those only, were dead. I have been told of three different instances where in care three different instances where, in carrying out bees from the cellar in the spring to stay, a colony or two was overlooked, and not discovered till late in April or early in May. In every instance these colonies were the best of the season.

The only cases where I have noticed any good to arise from winter flights, were where the bees enjoyed several days of perfect freedom to bask in the sunshine, and that before the time for breeding to begin. This truly short-ened the time of confinement, with no disastrous effects to more than offset the good obtained thereby

of things one of the requisites to suc- | the statement that Mr. T. saw a cess in his locality. Here, in our section, I think that some sensons early housing, before any cold weather has appeared, is best, while in other seasons a few cool, or even cold days are needed to get the stubborn bees into the semi-dormant state.

I have believed and held all along, that whatever the canse of our winter losses was, it was *one couse*, to which all other influences were as fox-fire to the sun, and at best only acting as aggravations to the great cause, and, as stated in my former article, I feel sure that the great main cause is the winter consumption of bee-bread. Last winter bees that were cellared were much better off than those that were left outside in this climate in any shape, because while those inside had the advantage of a less consumption of food (which resulted in many cases in a total abstinence from pollen-eating, though I know of one cellar full where all died), those outside had not the usual advantage of a thorough midwinter flight, or several of them, as was the case the winter before.

I know of several cases where packed colonies came through in splendid order, one lot being a whole amary: other cases, where bees entirely neglected did usually well. But these were exceptional cases. I think last winter's experience gave no proofs why we should turn from the out-door packing to the cellar. Perhaps a little of both would be good for large apia-ries. We often hear old residents say that years ago bees did not die during the winter if they had honey enough. notice that at that time most of honey was gathered from trees, while now, under a more advanced age of improvement of the country, these trees have been exchanged for weeds, the latter being greater pollen pro-ducers than the former, especially in the fall of the year.
Mr. Dadant's article, above referred

to, is one of much thought and information, and Lappreciate it. I only desire to point out the difference in treatment required in different localities.

Dowagiae, Mich., Aug. 8, 1881.

For the American Ree Journal.

#### How to Get Rid of Fertile Workers.

W. H. ANDREWS.

In the BEE JOURNAL, Aug. 10, 1881, Mr. E. A. Thomas writes under the above quoted heading, and I feel sure that as a generous man be will not think it unkind if I question some of his teachings, both as to logic and

First, he says: "I think there is a First, he says: "I think there is a difference in colonies, for, while some will readily accept the means of obtaining a queen, others seem bent on their own destruction," etc. Now, this implies that some colonies have innate peculiarities less favorable in their own perpetuity than in the happy enters of others; this in my bundle. nature of others; this, in my humble judgment, is error not meant.

The difficulty in introducing queens and brood into queenless colonies increases with the length of time the colony remains queenless and the number of laying workers therein produced; there is no exception to this rule. this rule.

Second: "I have never had a full colony with a fertile worker, but now and then have a nucleus colony, which loses their first queen on going out to meet the drone, and so has no means

This implies at least one, and may be two of three things: 1st, that Mr. Thomas never had a full colony; 2d. that full colonies never lose their first queens; 3d, that when they do lose their first queens they are never without the means of supplying their loss. I take it that not one of these conclusions is correct in point of fact

Third: "I watched her while she laid quite a number of eggs, the bees treating her with all the consideration they would a queen, and then I pinched her head.

I do not question the correctness of tain about the same amount of flying

the statement that Mr. T. saw a worker lay quite a number of eggs, for I have seen quite a number of workers laying in the same comb at the same time, but that "consideration" business puzzles me, for I never saw that, or anything that I could mis-take for it; if the other workers give the laying worker the consideration they are wont to give a queen, Mr. should have no occasion to be tronbled about informing his readers as to the best mode of ridding a colony of the fertile worker, for he would only need to say, examine your combs, and when you see the other workers treating one worker "with all the consideration they would a queen, why, just there and then, pinch her head"—that would settle it. There is no mistaking the consideration given the queen by her workers.

I get rid of laying workers by giv-ing the colony one frame of brood, in all stages, each day for 5 successive days, and the work is done.

A very good way is to put the colony into a transportation case (a light box made so as to receive a bee hive and shut it in bee-tight, with handles on shut it in bee-tight, with handles on each side) and set the case a few steps off, and then set a new hive on the old stand and put into it a comb of brood in all stages, and a comb of honey, then raise the rear end of the case hid slightly, so that the bees will find their way out slowly; at the end of the fourth day shake all the bees that still remained that sail samples? that still remain on the old comb off at the entrance of the new hive, and is accomplished. McKinney, Tex.

For the American Bee Journal.

#### The Degeneration of Bees.

S. S. BUTLER, M. D.

How to make and ruin an apiary by gradually reducing the vigor of the bees by artificial swarming is the question. Mr. G. W. Thompson, in the BEE JOURNAL of May 25, page 166, in the 3d column, under the head

of wintering, says:
"Meeting a man who keeps bees, Meeting a man who keeps nees, some distance from my home. I asked how they wintered; he replied, first rate, sir. How many had you in the fall, said I. Eight. How many now, I inquired. Eight, doing finely, pointing to 8 weather-beaten pine boxes on a broaten and the said and th a bench; no protection except some boards nailed against the fence. There they stood in January just as they did in August—no cellur, no chaff no dead-

Now, why did those bees winter well in those common hives with no protection, when so many over the country were lost? I claim that his bees had not lost any of their natural vigor or toughness, had not degenerated by either rearing forced queens himself or being near enough to one who has, for his queens to get fertil-ized by imperfect drones, from their forced (and as I claim imperfect) queens, thus giving workers not up to the regular standard in hardiness. The proof is that they wintered with-out loss. I defy anyone to give any ont loss. I dely anyone to give any other reason than that they had the necessary vigor and hardines to carry them through the winter in spite of the cold and long confinement. So would all those bees that were lost have been hardy enough to have carried them. nave been hardy enough to have carried them through, if it had not been for vigor lost by almost every beekeeper rearing or buying, for years past, forced queens, and, by so doing, lowering the standard of his bees. It is almost impossible to find one who keeps bees in the common hive, who either rears a good many forced queens by driving or has a dividing neighbor near enough to spoil the vigor of his bees in a few years.

One of the first plans given us for

One of the first pans given us for forced swarming, with movable frame hives, was by dividing, by taking ½ of the combs and putting them into an empty hive, setting it beside the old one, the entrance of each being a lit-tle one side of the old one, so as to re-

This, of all the various plans bees. of artificial swarming, has no doubt been practiced the most, and caused the most injury to the bees of the country.

Let us follow out the workings this process and note its results. queenless part rears one from larva, from 1 to 3 days old, making a queen not up to the standard of one reared by natural swarming, which will give workers that want honey in abundance close to the apiary, or else they will try to steal if from their more vigor-ous and successful neighbors. I had a ous and successful neighbors. I had a cell sealed up in 45 hours where I put a frame of brood in a queenless colony to find out if they had one. Does any bee-keeper think that queen, if I had allowed her to have been fertilized, would have borne any comparison to one reared in a colony in a normal condition from an egg? This forced queen, if she lives till next spring (for they are short lived) will fill all the they are short fived) will fill all the drone-comb in her hive (such being generally great drone layers. Those drones fertilizing queens, stamp their imperfect individuality on the workers, which have lost a portion of their toughness or vigor, and as queens are reared from those worker eggs; the next forward amony made by queens are reared from those worker eggs; the next forced queen made by dividing is poorer still, giving the apiarist poor workers which bring him in but little honey. He goes on dividing (for he is getting rich, making colonies by the quantity, worth a good sum each).

What wonder if after this reducing system has been practiced, for a for

What wonder if after this reducing system has been practiced for a few years, he finds his queens very short-lived and is puzzled about it! He reads that queens live from 3 to 5 years, and finds that his bees, that wintered almost any way the first few years, need a great deal of nursing, require costly chaff hives and cellars to winter them well, but when they get so reduced that they can stand but little, cellars or chaff hives do not save them in such a winter as the save them in such a winter as the last. One who had been sneering at his "old fogy" neighbor with common box hives, who is far enough from him not to have his bees spoiled from him not to have his bees spoiled by drones raised from his poor forced queens, ought to see why his bees wintered so much better than his own. Forced queens give great quan-tities of imperfect workers, that the workers kill off in great quantities where they kill the drones.

Such are the results of too much dividing. How is it with forced queens reared in full colonies, largely advertised? The queen and brood are taken away, and after the bees get over their worry, they commence cells, of-ten allowing the eggs given them to hatch and be fed worker food 1 or 2 days before giving them royal food and enlarging the cell. They gener-ally start so many cells that the nurse bees are not able to furnish royal food for them to unless purfect entered. for them to make perfect queens, although I have seen but 3 or 4 of those small half-starved looking cells in a large colony, that worried a long time at the loss of their mother and brood. I am satisfied that the difference in size of cells made by a swarm in normal condition, or an abnormal one, is the lack of ability to furnish a large quantity of royal food, so they half starve them; while in the large cells reared in the hive that has swarmed the cell after the queen has left. We never see any in the small cells, where the bees are forced to make a queen, no averther how they are forced. no matter how they are forced.

Any one can demonstrate this mater, by rearing forced, instead of natter, by rearing forced, instead of natural queens, as hundreds have, in the past, and reported by scores in the bee papers, about as follows: See Gleanings for Feb., 1881, page 84, by J. C. Phillips, this being an almost exact report: "I kept bees in the old fogy style till 1872, when I began with a movable comb hive with 2 stands, increased to 6 by dividing, got no honey; started next spring with the 6 (you see he wintered well); this and the two following seasons increased mostly by dividing to 15, took 600 lbs. honey; next year I increased by di-

viding to 35, and took 1500 lbs. honey; next spring I had 30 (he did not win-ter quite as well), increased to 75, mostly by dividing; the next May found me with 11, it being a good year, increased by dividing to 52." This brings him down to such a win-ter as the last, which as matter how. ter as the last, which, no matter how much pains he has taken in wintering, closes him out. Los Gatos, Cal.

Best winter and summer hive, diploma.
Best and most practical invention for retaining even temperature in bee house, \$3, \$2.
Best mode of securing the largest yield of box honey from a single hive, \$3, \$2.
Best and most valuable invention in bee hives not heretolore exhibited or made public, bronze medal.
Best non-swarming hive, diploma.
Best non-swarming hive, diploma.
Best honey extractor for general use, \$2, \$1.
Best honey extractor for general use, \$2, \$1.
Best honey extractor for general use, \$2, \$1.
Best and largest display of apiaran supplies, \$10, \$5.

\$5.

Best and most practical new invention for the apiarist, \$5.

Best torm of hive, bronze medal.

Critical readers of the above will be able to detect deficiences in it, and it is only fair to say that it was prepared as the result of individual suggestion. Our Association as such, has not yet had an opportunity of considering it. No doubt, improvement will be made on it next year. Indeed, it would be a good thing if the North American a good thing if the North American Bee-Keepers' Association would bring its wisdom to hear on the matter of a prize list, which, with slight modifica-tions, might do for all our State and Provincial exhibitions.

For the American Bee Journal.

#### Introducing Queens.

A. F. MOON.

The success in introducing queens is due more to the method than what is sometimes termed "luck." I have tried nearly every plan, and long since adopted the following one:

Remove the old queen from the hive you wish to re-queen, and place

the wire cage containing the queen between 2 combs of scaled honey. If the cage is too thick, cut out a piece of comb large enough to receive the cage and place her gently into the hive. If she is a fertile queen there are always some bees, like the good Samaritan, who will feed and care for

The disposition of the honey bee very much resembles that of the luman family; some are always peevish and fretful, while others are gentle and kind; some colonies will receive a strange queen within an honr after the loss of their mother, and some colonies will never start a queen cell after their mother is removed, providing a fertile queen is immediately given to them; while other colonies show hatred toward their stepmother, and a constant desire to rear a new queen, by starting from 5 to 25 queen

I have tried introducing queens by taking off all the bees from the combs taking off all the bees from the combs and daubing the queen well with honey. I have had pretty good success, but have found some that had fallen a prey to the angry bees by their balling her. In this case it is sometimes difficult to resene her. I have even known them not to kill her after giving her a severe hugging; her pit iful cry for mercy may have saved her. I have known them to hug a queen for a whole day and then receive

her.

To get rid of fertile workers I give them a frame of brood containing, if possible, a few queen cells; it does not matter materially if they are sealed. I now remove from the stand one of the strongest colonies in the minum place the sealed standard or the strongest colonies in the minum place the sealed standard or the strongest colonies. apiary, place the queenless colony in its place, and the strong one where the colony containing the fertile worker stood, and the job is complete. of the standard of the standard of the search and the search are given, under these circumstances, the bees seldom molest them; the colony, through surprise, are thrown into confusion, and the search of the standard of the search of the sea and are made sensible of their loss at once, and are more apt to recognize their want and appreciate their pros-perity by receiving a new mother. It is seldom that bees destroy uncapped as senon that bees destroy lineapped queen cells, on account of their strong attachment for their young.

The weather is very dry, a heavy drouth now prevails and the bees are

doing nothing. Rome, Ga., July 28, 1881.

Rural New Yorker.

#### Improving Honey Plants.

CH. DADANT.

The family of the Leguninosa is one of the best for bees and for cattle. In this family we find the White Clover (Trifolium repens) of our pastures, the Melilot (Melilotus alba) whose the Mehlot (Mehlotus alba) whose name is derived from the Greek word meli (honey) and the Sainfoin (Onobrychis sativa), a plant which does not withstand our winters, but which, in France, gives the best honey and the best fodder.

Nearly related to the White Clover is the Red Clover (Trifolium arvense), which furnishes as great a quantity of honey as any one of the plants men-tioned. Every country boy has sucked the honey from the tubes of its corollas: but few know that, if they had the chance of tasting this sweet, it was because bumble bees are nearly the only insects which can reach it, and bumble bees are too few in number to absorb such a large crop, which, therefore, remains unharvested, the corollas of Red Clover being too deep to allow the

honey bees to suck it.

These corollas are only a very little too deep; for, during the drought of some summers, the flowers of the secsome summers, the nowers of the sec-oud crop, being a little shorter, the Italian bees find in them a good har-vest; yet it is doubtful whether in the best circumstances their probosces are able to reach the bottoms of the tubes Moreover, the honey of the main crop is always out of reach of the bees, and the aim of bee-keepers is to produce a kind of bees endowed with a tongue kind of fees endowed with a foligue long enough to reach the bottom of the clover blossoms, or to produce a kind of red clover whose blossoms would be shorter or wider, so that bees could suck all the honey; or to attack the difficulty in both ways at

in the fields, the plants whose corollas are wider or shorter than usual, in order to secure a sort in which they will be broader. But the task will be long, and we want help, if not in regard to bees, at least in regard to the selection and propagation of selected plants.

plants.
A seed grower who would take the A seed grower who would take the thing in hand, planting selected clover with this object in view, if he succeeded, would be sure of a good sale of seeds at runnuerative prices; for every bee-keeper would try to have the new variety introduced to his neighbors. Of course, the end to be attained is, not to produce a short corolla by raising a diminutive plant rolla by raising a diminutive plant, but to create a strong, vigorous kind, endowed with short or wide corollas, the sap of the plant being directed more towards the branches and the leaves than towards the corollas.

I dare to predict for the lucky man who would succeed in raising a clover with such fixed characteristics, large sales and big profits. Hamilton, Ill.

For the American Bee Journal.

#### A Few Interesting Facts.

J. H MARTIN.

It is a fact that many apiarists admire the use of sugar syrup upon which to winter bees, in preference to natural stores

It is a fact that there are a dozen or more glucose factories in our country making tons of a deleterious substance used solely for adulteration.

It is a fact that our grocery-men are selling sugar and syrups adulterated with glucose, because it gives them

greater profits.
It is a fact that the consumer finds

It is a fact that the consimer linds his sugar entirely different from what it used to be. It has less sweetening power, and is hard and lumpy. It is a fact that glucose will kill bees if you attempt to winter them upon it, either in liquid form mixed with honey, or sugar syrup, or in the form of candy.

It is a fact that bees will winter

well upon good sealed honey.

From the above facts we have reached the conclusion that it is better to winter upon natural stores, than to run the risk of buying sugar, a portion of which is glucose.
Hartford, N. Y., Aug. 19, 1881.

For the American Bee Journal.

#### Origin of Sending Queens by Mail.

C. J. ROBINSON.

It appears that some of the enterprising queen breeders deem it very important that queen shipping cages have many distinct features to render have many distinct features to render them suitable in the highest degree. The essential features of such a cage are quite simple—only to afford bees the conditions requisite, as I learned from experience before any other party ever mailed a honey bee. My humble self has the credit of being

humble self has the credit of being the original shipper of queen bees by mail transit. It was from necessity that I devised the mode of transporting queens through the mails, and contrived a shipping cage.

In 1859, when the Italian bees were first imported, up to July, 1862, I was receiving queens from J. P. Mahan, of Philadelphia (the first successful importer of bees), and also from others, including Rev. L. L. Langstroth, who shipped by express. At that time no express office had been established at snipped by express. At that time no express office had been established at this point, and I was bothered to get packages from the office in due time. I wrote to Mr. Langstroth, asking his opinion on the feasibility of sending queens per mail. He answered, signifying that he deemed the plan impracticable. Still I was bent on trying the experiment, and caged a black queen in a package, which I addressed to Mr. the same time. The work has already begun. Some bee-keepers try to produce bees endowed with longer probosces, and some others are selecting, all right. Then Mr. L. contrived a

cage, in which he put a fine Italian queen, with a few workers, and mailed to my address. When the package came to hand the workers were all dead and the queen died soon after. I reported the arrival and ill success to reported the arrival and ill success to Mr. L., who contrived a cage different from his first, and sent it with a queen to me by mail. His second attempt proved as successful as my first was. Such is the history of the origin of transporting queens through the medium of the post office department. Richford, N. Y.

For the American Bee Journal.

#### Cyprian and Palestine Bees.

A. W. OSBORN.

The accompanying letter from Mr. G. M. Doolittle, whose judgment we respect, will, I think, be of general in-

terest:

Borodino, N. Y., July 25, 1881.
As to Holy Land queens and bees I know nothing, but will say that I believe the U.S. would have been just as well off without them. You will see that as the Holy Land and Cyprians are so nearly like the Italians as to color, that should they prove inferior, they cannot be separated, as can the blacks and Italians. Let me prophesy: Five years from now, but few persons in the United States will be able to tell of what their stock conpersons in the United States will be able to tell of what their stock consists; for just as soon as Palestine and Cyprian drones are plenty, who can tell by the workers or queens whether their queens have mated with an Italian, Cyprian or Palestine drone? Hence you will see, that should these last two prove inferior to the Italians, we are in a dilemma. the Italians, we are in a dilemma. know the rush generally goes for something new, but I am content, at present, to let others try these bees.

G. M. DOOLITTLE.

Thus far, I have not found the Holy Thus far, I have not found the Holy Land bees superior to the Italians. I handled over 400 queens this summer, both Italian and Holy Land, and I watched them closely. Perhaps the Palestine bees are not suited to our dry seasons, and under the most favorable circumstances would make a better showing. With us the honey season is over. The yield has been very light, not more than I apiary in 10 that has taken any surplus. The in 10 that has taken any surplus. The remaining 9 will have to be fed, to keep the bees from starving. But we keep the bees from starving. But we live and work on, cherishing the hope that next year will make up for this, and in fact, bee men have come to believe that it is impossible to obtain 2 good crops in succession.

I wish the best of success to all the bee-keepers of the East, and prosperity to the BEE JOURNAL, which comes to us every week, filled with good things.

Los Angeles, Cal., Aug. 13, 1881.

For the American Bee Journal.

### The Calendonian Apiarian Society.

#### J. D. HUTCHINSON.

This society held their 8th annual exhibition at Sterling, on July 26, and 3 following days, and as in former years under the patronage of the Highland and Agricultural Society of Scotland Scotland.

Owing to the very wet weather which we have experienced here all this summer, there was only a limited display of honey; but this was more than made up by the fine appearance of the "observatory hives," which, as usual, was a great attraction, the queen being eagerly sought after. In queen being eagerly sought after. In this department the competition is getting keener at every show. The first prize was awarded to Mr. D. Woods, of Benmore, whose hive was much noticed for its ingenuity and beauty. It is made to serve two pur-poses that of an ordinary observators. beauty. It is made to serve two purposes, that of an ordinary observatory hive, and is adapted for both summer and winter use. The frames, 4 in number, are arranged in 2 perpendicular and purpose and there is a placed at the control of the contro ular rows, and above this is placed a time.
number of small section boxes, which It is a little rough on foundation man-

the bees fill with comb honey: just as the bees fill with comb noney; just as if they were in an ordinary bee-frame hive. This hive can be all closed up in a few seconds, and the bees can be kept in it throughout the winter in perfect satety. The second prize was awarded to Mr. Young, of Perth, who exhibited an ordinary 6 bar Woodbury hive. Both these hives were well stocked with beautiful bees.

Great interest was also manifested

Great interest was also manifested in class 2, for the best colony of Cyprian, Ligurian, or any other foreign bees exhibited in an observatory hive. L. James Johnstone, of Touch, 2. William Sword, of Falkirk. There was a large number of entries in the competition for the hives, but as there was nothing of any particular note, I need not trouble you to enumerate was nothing of the awards.
In class 9, Mr. Johnstone carried off

1st honors with his samples of comb foundation, and wax in cakes of 2 lbs.

each.
The competition in the honey classes were very few, and the only exhibits of any interest was a few magnificent Stewarton boxes from Ayrshire, and a number of small 1 and 2 lb, section boxes of fine comb honey. The fine display of run or extracted honey which is yearly seen at this show was greatly missed. Class 23, for the best liquor or wine made from honey. D. Wood.

D. Wood.

For the best cakes made with honey.

1. Wm. Sword. The above exhibits were very tasty, but oh! how quickly they did vanish. In the miscellaneous classes there was a good display of hives, supers, bee-furniture, bee-gear, honey extensions and amount of the superstanding of honey extractors, etc.; and amongst the principle hive winners in this class were Messrs. Young, Wood, and Kin-

The driving competition for the Highland and Agricultural Society's silver inedal, took place on the last day of the show, in the large manipuday of the show, in the large manipulating tent belonging to the Bee Society. There was a large number of competitors, and after a very keen contest, the judges awarded the first prize to Mr. W. W. Young, who captured the queen in transit in 1½ minutes, and finished the driving of the bees in the same time. Miss Stewart, of Sterling came second, and was bees in the same time. Miss Stewart, of Sterling, came second, and was awarded the society's own silver medal; she took 4 minutes to capture the queen, and other 3 to finish the driving. The judges were Messrs, Anderson and Muirhead. During the 4 days of the show, the weather was very showery, and at times rained very beautiful that the visitors required to the same time. heavily; but the visitors seemed to enjoy themselves to the utmost extent. Altogether, the show was a great suc-cess, both fiancially, and otherwise, and much credit is due to the commit-tee for the way in which the arrangements were carried through.

On the Thursday night, a large com-

pany of the principal bee-keepers at-tending the show, dined together in McAlpine's hotel. The party spent a very enjoyable evening, which was greatly enlivened by the songs and speeches of the various members.

For the American Bee Journal.

#### Another Way of Swindling, etc.

W. H. STOUT,

Parties in this vicinity have taken lessons in bee-keeping from a professional, who charges \$5, for instructions, and gives the following receipt for feeding:

5 lbs. A sugar, I teaspoonful fine dairy salt, ½ lb. essence of lemon, I knife-point full cream tartar, 3 pints of water, to which add ½ tea cup full of vinegar, if you wish comb built.

The following for spring feeding:

2 bushels of rye, 5 lbs,  $\Lambda$  sugar, 3 spoonfuls of dairy salt. I teaspoonful essence of lemon,  $\frac{1}{4}$  spoonful of cream

This is, of course, a kind of private mixture, but as the JOURNAL readers are entitled to all the valuable discoveries. I take the liberty to have you publish it, perhaps for the first time.

ufacturers, I know, but you see a little vinegar will save us all that expense. How the little fellows are to pense. How the little fellows are to appropriate the rye does not appear. For the present we are satisfied with A sugar and water, and rye and oats ground together for spring feeding. The other articles we would prefer mixed with flour for cakes.

We are disappointed in our honey crop; so far obtained only about 300 in sections from 19 colonies lbs, in sections from 19 colonies in spring, and increased to 32, of which several are yet only nuclei. During June it was very wet, yet white clover was plentiful, but as our bees cannot swim, to gather the honey, we got very little of it. Since June we had it dry enough, so that corn and potatoes will not make  $\frac{1}{4}$  of a crop, and the grass looks as if scorched. We sowed some early buck-wheat for bee-forage, but it yields scarcely any honey, and but it yields scarcely any honey, and less grain. We also have some of later sowing which may do a little better, if we get rain soon. On the whole, we had a season of extremes, the coldest winter, the wettest spring, the hottest and dryest summer that is re-membered—well, by the oldest inhabitant. We have a colony of bees now having 2 queens; the old queen has her wing clipped, and the bees swarmed out twice; each time we caught the queen, removed cells, and returned the colony; but they did not queen lately, and both were in the hive on one comb a few days ago. Another colony had a queen with defective wings; they also swarmed and returned twice, then superseded the old queen, and came out with 4 young queens at one time. We caught 3, gave them to nuclei, and left them 1; since, they have done well. From these instances, we infer that bees are sometimes averse to having queens that cannot fly.
Pine Grove, Pa., Ang. 22, 1881.

### The British Bee and Honey Show.

The seventh Exhibition Association in the gardens of the Royal Association in the gardens on the keyar Horticultural Society at South Kensington, London, has been rather conspictions for the quantity and excellence of the honey than for evidences of progress among appliances. The total entries numbered 274, while the attendances have been on the whole satisfactory, and the interest in the subject evidently growing. In Class 2 the Carniolan bees were very distinct. This variety, though sombre in luctorial been couraged, since they are good workers, not persistent swarmers, and extremely mild in temper. Observatory hives brought out one or two impracticable novelties, and we were glad to see that the mistake was not repeated of giving prizes where large flight space involved wholesale death to the bees, being a necessary part of the construction. Mr. Holland showed a pretty and ingenious observatory which at present partly involves indicated defeat, which without diffi-culty he could remedy. Mr. Scott showed a hive in which the frames fit together, but have glass between the combs. These can be independently lifted for observation. In our opinion the old form of observatory, in which the combs are visible constantly and without interference, yet remains to

be excelled.

The display of honey has not hitherto been equalled. The total weight was nearly 3 tons, while the flatness, finish, and color of the sections seemed to have but little man for progress in to leave but little room for progress in this direction. The extracted honey was bright with hardly an exception, was bright with natedy an exception, and must constantly have sorely puzzled the Judges in making their awards. For the best exhibition from one apiary Mr. Thorn was to the front with a magnificent lot of 3842 lbs.,

which with his other entries brought which with his other entries brought his total up to 528 lbs., by far the largest amount of English honey yet staged by one exhibitor. Mr. Walton came second with 227 lbs., and Mr. Hooker third with 11 dozon 1 lb, sections, all of admirably even quality. The next class for supers not sections was on the whole poor, and calls for little remark. The glass supers, band-some but unsalable, are clearly giv-ing way before the handy sections. The cost and risk of transit, without a hance of sale, will in the end banish these ornaments from our exhibition

benches.

Class 13, best twenty-four 2 lb, sections.—Mr. Walton surpassed Mr. Thorn with boxes that can only be equalled. Miss Guyton and Mr. Thorn were second and third in a class in which to win is an event.

The silver medal for foundation was replaced at the desire of the Judges for 2 of bronze, one for Mr. Raitt for thick foundation, and the other to Mr. thick foundation, and the other to Mr. A silver medal was awarded to Mr. Abbott, Jr., who showed Faris' method for making foundation by dipping. In this he displayed considerable dexterity, nearly if not all the sheets being turned out perfect. Mr. Cowan again won in the class for extractors. The machine in principle is that of but your with an class for extractors. The machine in principle is that of last year with an additional movement by which the combs can be more readily put in position. Mr. Abbott showed an expedi-tions way of sealing honey jars. These are first coated with wax on the lip; waxed paper is then, after filling, pressed upon the glass; and the two surfaces of wax unite, and a complete closure is effected.

The Baroness Burdett Coutts distributed the prizes on Thursday, July 28th. The Rev. H. R. Peel has sufficiently recovered from his severe illness to allow him, to the delight of all, to be present during a part of the time the Exhibition was open, Mr. T. W. Cowan kindly taking general-oversight-during the whole week.

The bee-keepers of Ontairo will hold their annual convention Tuesday, Wednesday, and Thursday evenings, second week of the Industrial fair, 13th, 14th, 15 September, thus allowing those attending the convention to see the exhibition when it is at its best see the exhibition when it is at its best and also the convention, which promises to be of such importance that no hee-keeper can afford to miss it. Ladies are especially invited to attend. Notice as to place of meeting will be given in due time. D. A. Jones.

The Southern California District Bee-Keepers' Association will hold its annual meeting in Los Angeles City, Sept. 8, 9, and 10, 1881. All per-City, Sept. 8, 9, and 10, 1881. All persons interested in bees and honey are

respectfully invited to attend.

J. E. Pleasants. Pres. Anaheim, Cal.

The Northwestern Bee-Keepers The Northwestern Bee-Keepers association will meet in Chicago, on Tuesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. MILLER, M. D., Pres. States. C. C. MILLER, M. C. C. COFFINBERRY, Sec.

👺 The Eastern Michigan bee-keepers' Association will hold its fall mee ing in Detroit, Oct. 4, in the Y. M. C. A. hall, at 10 o'clock a. in. A. B. WEED, Sec.

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Wis., Nov. 30, 1881.
N. E. France. Sec., Platteville, Wis.

The Northern Michigan Bee-Keepers' Association will hold its fourth Annual Convention at Maple Rapids, Clinton Co., Mich., Oct. 11 and 12, 1881. O. R. GOODNO, Sec.

# SELECTIONS FROM

Thoroughwort.—I send by this mail a specimen of a weed that grows here in wet land, about waist-high, and which blooms from the middle of August until frost. It has a small white flower, on which the bees work steady all day long. What is it? Some here call it boneset; the tea of it will vomit a person quickly. My bees worked on it so industriously last fall, I thought maybe the impure, sour honey came from it that caused dysentery. It is very dry here now, and the bees that very dry here now, and the bees that had plenty of stores the first of July had plenty of stores the first of July have used at least one-half in rearing brood, and have gathered none since. I observed in last week's Bee Journal, that men differ greatly on the value of the Cyprian bee. While Mr. Dadant condemns them, Mr. Muth and others praise them, so that beginners hardly know which to purchase. hers narmy know which to purchase.

I have four as line queens as I ever owned, of the Cyprian variety, bred from imported mothers; they breed faster, and their progeny are as gentle and easy to handle as Italians, and just as good workers. I prefer the Cyprians. Success to the BEE JOURNAL. D. S. KALLEY. Mansfield, Ind., Aug. 23, 1881.

[The specimen sent is thoroughwort or boneset (Eupatorium perfoliatum), and is an excellent honey plant.—ED.]

Weather Scorching but Sweet Clover Yielding Honey.—1 have read Dr. Keene's letter in a late Journal about Rocky Mountain bee plant and sweet clover. 1 have had 75 to 100 large plants of sweet clover in bloom in our problem this grouper that below many garden this summer, the bloom upon which was immense. It bloomed in June, and when at its best, the bees were very busy upon it about a week, when to my great surprise, they abandoned it and let it alone for over a month, and I concluded it was worth-less for this locality. Then came the less for this locality. Then came the drouth with no rain for over 3 weeks, when I was again surprised by seeing the bees resume work upon sweet clover, and during the hottest and dryest day we had, with the mercury 101 in the shade, and a dry, scorching wind from the southwest, they worked upon sweet clover from morning until nght continuously. Of its value as a honey plant I cannot speak from ex-perience, except that I am sure it can-not be so dry that sweet clover will not yield honey. D. P. NORTON. Council Grove, Kan., Aug. 22, 1881.

Light Honey Crop. -The honey crop will be a very light one here this sea-son, though early in the season it bid fair to be good. We obtained a little fair to be good. We obtained a little surplus honey from basswood bloom. Our bees have swarmed well this season; one colony gave me 3 large swarms in 4 days. It is so dry here now that there is nothing for bees to work on. If it rains, which it has not done in 3 weeks, I think it is too late for much forage. Everything looks as though it had been scorched. I wish all who have sent money to II. A. Burch & Co., for apiarian supplies, or bees and queens, and have received no compensation for their money, in the last year, could be put in a list, so we could see how much money they have made out of bee-keepers. I will add my mite: In April last I sent Our bees have swarmed well this seahave made out of bee-keepers. I will add my mite: In April last I sent \$3.50 for a nucleus, but have no bees yet. They do not correspond any more; they say each will be served in turn. I think it is about time to class such men where they belong.

Day to Bree, 8R.

Richfield, Ill., Aug. 16, 1881.

Drouth in Texas.—We are suffering from a most protracted drouth. My bees have hardly gathered  $\frac{1}{3}$  of a crop. We are all somewhat discouraged. W. H. Andrews. McKinney, Tex., Aug. 16, 1881.

June 2 home-bred queens of this strain, presumably fertilized with the strain, presumably fertilized with the Cyprian drone. I am glad to be able to concur in the testimony of Mr. Muth—that I find them not only handsome, but 'as gentle as any to handle.' I certainly think it would be well for us to go on with the infusion of this new blood, notwithstanding the exceptionable cases of wrathfulness reported by Mr. Dadant and others. I cannot believe that they will prove in the average more irrascible than the blacks, while any improvement that may result from the provement that may result from the cross will not be at the expense of the beautiful marking of the Italians.
J. S. Woodburn.

Livermore, Pa., Aug. 21, 1881.

Cellar Ventilation.-I have read in some of our bee publications that a cellar should have a ventilating tube enter it from below the frost line in the ground, and extending some distance to an opening. Will some one tance to an opening. Will some one baying such a ventilating tube give the size of orifice, and the length necessary to secure a uniform tempera-

thre during severe weather?
J. H. Martin.
Hartford, N. Y., Aug. 20, 1881.

Much Interested.—I am very much interested in anything touching bee culture; I therefore find the BEE JOURNAL exceedingly attitutive and instructive, and would not like to miss a number of it. G. E. T. Kyber. Green Bay, Wis., Aug. 22, 1881.

100 lbs. per Colony.—In my report given on page 226, July 20, is a little mistake. I lost 31, or rather 32 colomistake. I lost 31, or rather 32 colonies out of 87. I have now increased to 92, and am getting a fair surplus. I shall get considerable over 100 lbs. I shall get considerable over 100 lbs. of box honey from each of several colonies in the spring. The honey crop in this part of Wisconsin is very light. The harvest, truly, has been great, but the laborers have been few.

B. T. DAVENPORT.
Auroraville, Wis., Aug. 22, 1881.

Another Swindler.—I have received

Another Swinglet.—I have received the following letter:

"Please give me information, if you can, namely: Is there a National Bee Co., if so do they establish agents to sell their goods? Is there a patented bee hive called Kidder hive? A your willed kinglet Kidder In man called himself Kirk Kidder, Jr., selling territory to use this patented hive. Was he a bogus or a genuine representive of the Co.? He said you was their agent at Cincinnati, O.—C. HAUCKE.—Greenup, Ky., Aug 20,

There is a fellow by the name of Kidder, I believe Kirk Kidder, Ir., who makes himself unpleasant, and whom I can prove to be an impostor and a least transfer of the statement of the statement. humbing, by a number of letters on hand. As he is using my name in his swindling concern, I am obliged to swinding comern, Tam obliged in speak in plain language, as my time is taxed answering letters in regard to that man, a little more than I can stand. The Bee Journal will please publish Mr. Hancke's letter of incourty which I enclose, and my analysis. inquiry which I enclose, and my answer, as follows:

swer, as follows:

Mr. HAUCKE:—Your favor at hand, asking me if there is a National Bee Co., and a patented Kidder bee hive. You say also that I am the agent of that company, in Cincinnati, as stated by Kirk Kidder, Jr. To this I reply that a National Bee Co. may exist in the brains of your Mr. Kidder, but that it does not amount to a row of pins to the rest of the world, just like the patent on his bec hive; there is no such patent, and he cannot make you pay anything. If he tells you I am the agent of anybody, he tells you a lie, and you had best treat that humbug as he deserves, i. e., "boot him out doors." I have had so many letters in regard to that fellow that I in-

The Docility of Cyprians.—While I have no experience with imported against me for infringing on his patents and it is to this number of the Cyprians. I introduced to my yard in June 2 home-bred queens of this court.

Other parties he has stated that a suit only 39 stands, and it is to this number 1 expect to reduce my colonies after the present batch of queens is discourt.

C. F. Muth.

Cincinnati, O., Aug. 24, 1881.

· [We have occasion to know that this man "Kidder," is a swindler. He has troubled us the same way.

Distance Between Frames.—In Prof. ook's "Manual," page 136, eighth Distance Between Frames.—In Prof. Cook's "Manual," page 136, eighth line from the top, in his instructions about the distance frames should be from each other, he says "14 of an inch, though a slight variation either way does no harm." Again, on the same page, 2 or 3 lines below, he says "some men prefer nails or wire staples which project just 14 of an inch," etc. I would like to have him tell us how he handles frames and keeps bees in his hives with only 14 inch space now he mannes traines and keeps oces in his hives with only  $^{1}_{4}$  inch space between the combs. I find, in prac-tice, that not less than  $^{1}_{2}$  inch will do, and I find 9 frames in the Langstroth and 1 and 9 traines in the Langstroth hive do better than 10. I have used only 9 for 2 years past, and like it much better, but only 14 inch is, I think, avery greaterror, and will make bad work for beginners, for I know in practice it will not work with me, and I would like very much to have and I would like very much to have Prof. Cook tell us, through the BEE JOURNAL, how he manages his hives when full of bees, with only  ${}^{\rm I}_4$  incl

pace or less between the frames. S. H. HUTCHINSON. Mechanics Falls, Me., Aug. 8, 1881.

followed. I always have given  $11_2$ inches to each frame, or 12 frames to a hive 18 inches long.—A. J. Cook.]

The Bee Moth.—I see in the report of the proceedings of the convention of the Barren Co., Ky., society, that among other subjects submitted to that body for discussion, was, "Can we manage bees so that the moth worm will not destroy them?" The answer to that question might have been made up of one word of 2 letters. The "cattle men" of west Texas met The "cattle men" of west Texas met in convention, at Fort Worth, in this State, one day last May. Now, had the question, "Can we manage cattle so that the buzzards will not destroy them?" been submitted to that body for its decision, the same answer of one word of 2 letters would have been literally correct, and for the same reason. My object is to draw out a discussion upon the (among bee-keepers) "king of terrors," the greatly misunderstood, and comparatively harmless little, so called, bee moth. Here in little, so called, bee moth. Here in the south a great cloud of ignorance on the moth question hangs over us like a hideous nightmare, and prevents thousands from keeping bees, and worst of all, enables ignorant, or unserupulous, moth-trap venders to impose on our harmless and confiding people. W. H. Andrews.

McKinney, Texas, Aug. 22, 1881.

My Report.—Last spring I brought with me from the Eastern part of the state 12 colonies of bees; 7 of them had scarcely the strength of good nuclei prior to May 1st. Being well through with their stores, 30 lbs. of through with their stores, 50 los, 61 sngar was made into syrup, and fed to them in April and early May, during which time also the colonies were equalized—so far, at least, as enabled me to utilize to the full the laying me to utilize to the full the laying capacities of the queens. As their summer's work, I am able to report 1,165 lbs. of honey, mostly extracted, and 27 swarms. Counting nuclei, my out doors. Thave had so many let-ters in regard to that fellow that I in-tend to use plain language in regard to him, especially since he is using my name in his nefarious business. To number to-day is 49; but they occupy

ber I expect to reduce my colonies af-ter the present batch of queens is disposed of. As many have quite a sur-plus of honey on them yet, and as all are still storing slowly from the buckwheat and fall flowers, I am not troubled with visions of having to feed to any extent, to enter them "in good condition" for winter. But should the surplus of my honey gatherers not prove sufficient for the lack erers not prove sufficient for the lack of my queen rearers? I have still some \$30 proceeds of queens already sold, and more to come with which to buy a little sugar. Of the 10 colonies devoted to the extractor, 2 gave me 193 and one 184 lbs. of honey, and 3 swarms respectively. The 2 at the other end of the class gave me 109 and 75 lbs. of honey and as a covern creb. 78 lbs. of honey and one swarm each. The credit of this season's handsome The credit of this season's handsome yield (the best in my 10 years of bee-eulture), I would gratefully and humbly accord as follows: 1st, Providence; 2, Italian bees; 3, plenty of empty comb, and 4, management.

Livermore Pa

Livermore, Pa.

Sections with Wood instead of Glass.

I send a section box protected by -1 send a section now proceed by wood sides which are fastened to the section by what I call a "hinged lasection by what I call a "hinged label." I commenced the use of wood sides instead of glass some 3 years since, and fastened them to the section by a light rubber band, till this season, when I happened to devise this label. The rubber band did very well, but I wanted something to ever up Mechanics Falls, Me., Aug. 8, 1881.

[I have to thank S. II. Hutchinson for calling my attention to the above mistake in the Manual. 1 noticed it in the second edition (it was not in the first), and intended to correct it, but I wanted something to cover up the little stain of propolis, sometimes left on top of the section, and also to prevent the end of the wood-side slipping down into the honey, which sometimes happened when the sections were carelessly handled. This the hinge label "does very effectually, and also gives the section a neat appearance. I fasten them on with white and also gives the section a heat ap-not made. I regret the error, as errors are to be deprecated at all times and in all places. Yet the above is not serious, as the advice can hardly be followed by thinner. Our city grocers liked the wood sides fastened by rubber bands, far better than glass, as it is so much less liable to break up by their delivery teams, and now they like the "hinge labels" best of all. To ex-amine the honey, simply raise the lid or side from the bottom, the label actor side from the bottom, the label acting as the hinge. Of course I always glass a few sections for the grocers to put upon counters, in show windows, etc., but they all say, "give us the wood sides for delivery." How do you like them? Geo. I. Goodhue.

Thanville P. O. Con. Vag. 32, 1981 Danville, P. Q., Can., Aug. 22, 1881.

[This is a very clean and nice section, and where it is not desired to glass the sections, and some cover or protection is wanted other than the crate, these "wood sides" are very convenient.—Ed.1

My Hones almost Blasted.—My 13 any hopes almost blasted.—By a colonies of bees wintered without loss on summer stands, only I lost 2 old queens in February. I put the brood in with others, and then I had 11, in in with others, and then I had 11, in good condition; but the quantity of bees in each hive was small (about 2 quarts); they multiplied fast, and in the latter part of May and Jone, by natural swarming, they increased to 21 colonies, and to-day every hive is full of bees, comb, brood in every stage, and honey. I do not know how much. For 5 weeks we have had no rain, and with hot and dry weather; a great portion of the time, it was 1005 to 110 in the shade in my apiary, and on the 12th inst, it was 1125 in the shade, and 1505 in the sun, at the entrance of hive No. 7, at noon. It seems to me that the "blessed bees" are now living on bread and water. seems to me that the "blessed bees" are now living on bread and water, although I have 3 acres of silver-hull, golden rod, figwort, etc. I have obtained about 100 lbs, from white clover. I sell all my honey at 30 cts. per lb. Famine is staring my bees squarely in the face. If it rains in a few days, they will be all right. The wheat crop is light; corn is tolerably good; vegetables are very scarce, and honey is a failure. R. M. Osborn.

Kane, Ill., Aug. 22, 1881.

### THE AMERICAN BEE JOURNAL.

#### SPECIAL NOTICES.

Single copies of the Journal sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week. ....

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100,

😭 Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists -Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each. ....

When changing a postoflice address, mention the old as well as the new address.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

The Beauty and Color of the hair may be safely regained by using Par-ker's Hair Balsam, which is much ad-mired for its perfume, cleanliness, and dandruff eradicating properties. 31w4

Nearly all the ills that Alliet Mankind can be prevented and cured by keeping the stomach, liver and kidneys in perfect working order. There is no medicine known that will do this as quickly and surely, without inter-fering with your duties, as Parker's Ginger Tonic. See advertisement.

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any per-son. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents to pay. except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly remining.—If or a ctub of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the JOURNAL for a year free. It will pay to devote a few hours to the BEE JOURNAL.

It would save us much trouble. if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office. County or State.—Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums:

For a Club of 2.—a copy of "Bees and Honey."

" 3.—an Emerson Binder for 1882,

" 4.—Cook's (Bee) Manual, paper,

" 5.— cloth.

" 6.—Weekly Bee Journal for 1 year.

We have a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

#### emeago.

HONEY New honey is coming in freely and the mand is good. demand is good.

We quote light comb honey, in single comb boxes, 485/200 ; in larger boxes 2c, less. Extracted

Gerie, BEFSWAX - Prime quality, 185-20c. At., H. NEWMAN, 972 W. Madison St. Chicago, Aug. 20, 4881.

#### NEW YORK.

HONEY There is no settled market price yet or honey, as there is none selling. We quote as follows: White comb, in small coves, 150 180; dark, in small boves, 120 150. Ex-racted, white, 160 120; dark, 70.00. BEESWAX—Prime quality, 225 240. Thorn A. Co., 11 and 13 Devoc avenue. New York, Aug. 18, 1881.

#### CINCINNATI.

CINCINNATI.

HONEY.—Last week I paid King Cramer 17c, per lb. for a lot of about 2,000 lbs. It was in the Math sections, [3] xis, without separators. Every contest of the first section, [6] xis, without separators. Every contest of Mr. Cramer did not succeed, this section, in establishing rules for queen fertilization, he succeeded admirably in retting one of the finest lots of conib honey in the country. Extracted honey is just commencing to be in good demand.

I quote: Good comb honey, in sections, is worth 140-160, on arrival. Extracted, 7509, on arrival. BEESWAX.—180-20c, on arrival. I have paid 25c, per lb. for choice lots.

Cincinnati, Aug. 13, 1881.

#### ST. LOUIS.

## TIN PAILS FOR HONEY. The Bee-Keeper's Guide;

### MANUAL OF THE APLARY. By A. J. COOK,

Of Lausing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

— :o: — This is a new edition of Prof. Cook's Manual of the Appary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months - a sale unprecedented in the annals of bee-culture. This new work has been annals of bee-culture. This new work has been produced with great care, pationt study and persistent research. It comprises a full defineation of the anatomy and physiology of the honey bee, dilustrated with unny costly wood engravings—the products of the Honey Bee; the races of bees; followed the flower bees and the study of th full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated -- and last, though not least, defuiled instructions for the various manipulations necessary in the apiary

manipulations necessary in the apary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can affortfo downfront. It is fully "up with the times" on every conceivable subject that can interest the aparist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—E/Apiculture, Paris. I think Cook's Manual is the best of our Ameri-ean works.—LEWIS T. COLBY.

can works.—LEWIST, COLBY,
It appears to have cut the ground from under
future book-makers.—Brutish Bee Journal.
Prof. Cook's valuable Mannal has been my constant guide in my operations and successful management of the apiary.—J. P. WEST.

agement of the aparty.—J. P. West.
I have derived more practical knowledge from
Prof. Cook's New Manual of the Aphary than from
any other book.—E. H. WYNKOOP.
This book is just what everyone interested in
bees ought to have, and which, no one who outsins
it, will ever regret having purchased.—Mich. Far.

it, will ever regret having purchased.—Mich. Far.

Is a masterly production, and one that no beekeeper, however limited his means, can afford to
do without. No brakka Farmer.

To all who wish to emake in bee-culture, a
manual is a necessity. Prof. Cook's Manual is an
exhaustive work.—Heald, Montreello, Ill.

With Cook's Manual I am more than pleased. It
is tally my with the times in every particular. The
richest reward awaits its author.—A. E. WENZEL.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disniterested information contained in Cook's Manual.—Will, VAN ANTWERF, M. D.

It is the latest book on the bee, and treats of both
the bee and hives, with their implements. It is of
value to all bee-rinsers.—Ky. Live Stock Record.

It is a credit to the author as well the publisher.

willie to all bee-raisers.—Ky. Live Stock Record.
It is a credit to the author as well the publisher.
I have never yet met with a work, either French
or forcein, which I like so much,—L'Anne DU
Bots, editor of the Bulletin D' Aprentleir, France.
It not only gives the natural bistory of these industrions insects, but also a thorough, practical,
and clearly expressed series of directions for their
management; also a botanical description of honey
producing plaints, and an extended account of the
enemies of bees.—Di moerat, Pulaski, N. V.

management; also a botanical description of honey producing piants, and an extended account of the enemies of bees.—Dimocrat, Pulaski, N. Y.
We have perused with great pleasure this sude mercan of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an intere t in this subject, we say, obtain this valuable work, tead it carefully and practice as advised.—Agriculturist, Quebec.
This hook is pronounced by the press and leading bee-men to be the most complete and practical teatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will wele me and it is essential to every amateur in bee-culture. It is handsomely printed, nearly bound and is a credit to the West. Western Agriculturist.
This work is andoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explaination regarding the care and management of the apary. There is no subject relating to the culture of bees left unfouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowlede of apairrists, which he uses admirably to promote and make popular this most interesting of alloccupations.—American Inventor It may sately be pronounced the most complete and comprehensive of the several manuals which have recently appeared on the subject of bees and their handling in apiances. The studies of the structure of the beet, the different varieties, the various been productes, and following these the products, and following these thermoles are all of high and practical Progressive beek keeping, and writes of the themes discussed in the light of his own experience.—Pacque Rural.

Of the many excellent works which we have examined on heecculture, we consider Prof. Cook's ammed on heecculture, we consider Prof. Cook's

bee-keeping, and writes of the themes discussed in the light of his own experience.—Pacific Rieral.

Of the many excellent works which we have examined on bee-culture, we consider Prof. Cook's the most valuable for the study of those who contemplate going into the business or are already keeping bees. If thoroughly studied, and its teachings conformed to, by the aparist, who exercises a reasonable degree of common sense, he or she cannot fail to achieve at least a reasonable degree of success. The author ad ressus himself to the work with a degree of enthusiasing which carries the reader with him to the end.—Kansas Farmer.

Cook's Manual of the Apary holds in America the same high rank, that is accorded in Germany to the book of which Dierzon is the author; the only difference being that Prof. Cook's Manual combines the protoundness of the German pastor with the superiority of the practical American. He refers in several instances to burne; and does not belong to that class which hates everything that is torein, for he speaks of German naturalists with great reverence.—German Freidenker, Millwankee, Wis.

PRICE—Round in Schipper 12. The management of the first production of the control o

Entered at Chicago post office as second class matter.

#### The Honey Season of 1881.

It is, perhaps, rather early in the season to conjecture with any degree of certainty as to the honey-harvest for 1881; but enough is already known to justify the assertion that the yield, generally, has been very satisfactory. In a territory so vast as that of North America, embracing, as it does, every variety of soil and every degree of climate, it cannot be anticipated that each portion will be equally productive even in the most favorable season. nor will all parts be unproductive alike in times of general failure. These remarks are quite as applicable to the production of honey as any other commodity, and the present season has very forcibly illustrated it.

From all portions of the country we learn that the white clover bloom was unusually profuse and the linden was much above the average, while less important honey blossoms were quite as satisfactory; but owing to the decimation of the bees during the past winter and spring, but few apiarists were prepared to take advantage of the bloom in time to secure the best results. Those, however, who were in condition to make the most of it, are more than jubilant over their yield.

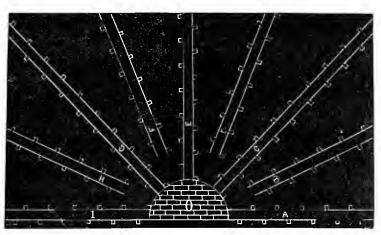

The summer harvest, however, has not been so generally satisfactory. In

States till the last week in July, and an eye to business, will drive the most entirely suspended the honey flow. Later, the drouth struck Illinois, In- attributable to a nervous anxiety on diana, Iowa, Kansas, Kentucky, Michigan, Missouri, and districts in other States. This, to a large extent, will past winter, bee-keepers in general be detrimental to the fall honey yield, have occasion to congratulate themand yet, with immediate general rains and tardy frosts, we anticipate a more than average fall honey crop.

The increase in bees has been remarkable everywhere, both by natural nearly their value in feed to carry them swarming and by division—some having increased tenfold. Bee-keepers are almost unanimous in reporting colonies in strong and excellent condition, and in most cases with plenty of honey for winter; therefore, whatever | destruction; where drouth has inter-

of June, which continued in many dle-men or jobbers; these men, with advantageous bargains. It is mainly the part of producers to sell.

Notwithstanding the disasters of the selves on the results of the year's work. Where cold, rigorous winter killed the bees, there also did it destroy cattle, sheep and hogs, or consume through; where storms and hurricanes have wrought to their disadvantage, other descriptions of property have been flooded or rnined, and even human life has not been exempt from

Dr. L. C. Whiting's Plan for an Apiary.

bloom, will be harvested to the best advantage, and may yet be a considerable addition to the season's report.

As we advised our readers in the early portion of the season, prices for honey are good, and the tendency is upward. This is not the result of a short crop, for the crop is not short, but is fully up to the average; nor is it the natural sequence of a partial failure in the California yield. It is the result of an increased demand for good honey at home and abroad. No longer does prime honey bega market, but is eagerly sought for, and finds a ready sale. Every price current in each considerable mart gives quotations, and nearly all the metropolitan dailies publish prices in their market reports. That these prices fluctuate several of the Southern, and particu- and vary greatly with each other canlarly in the Central States, a drouth of not be attributed to the absence of a long duration set in about the middle demand, nor is it the fault of the mid-pathy for Mr. Wilson in his misfortune. lives, are reported almost nil.

there may be to gather in the fall rupted the bees in their labors, fruit has been shriveled where it hung, corn parched in the fields, cotton shrunken and burned before matured, and general, pinching want stares the hardworking husbandman in the face. All in all, bee-keepers in general have less cause for despondent gloom than any other chosen occupation in America, involving a relative amount of capital.

> Unfortunate.-We are in receipt of the following note from Mr. J. T. Wilson, dated Mortonsville, Ky., Aug. 30, 1881:

> I received an injury last Saturday 1 received an injury last Saturday morning from the falling of an old shed, and for twenty-four hours did not know anything that transpired. The doctor thinks I had better keep out of the sunshine for a while, so if my patrons do not receive their queen this week they will know the cause this week, they will know the cause.

Our readers will join with us in sym-

#### Plan for an Apiary.

Dr. L. C. Whiting has furnished us with the following description of a plan for an apiary, which will be found delineated in the engraving on this page:

After looking at the engraving, in No. 27, of Mr. Root's picturesque apiary, I thought of sending you a draught of a plan adopted by me some years since, which for some reasons gave me more satisfaction than any

It will be seen from the accompanying engraving that the hives radiate from a central point, in double rows, about 5 feet apart. These spaces are for passage-ways, and from which the bees are manipulated. The front (or entrance) faces out from this passage-

way.

The point gained by this arrange-The point gained by this arrangement is the facility of seeing any unusual action among the bees. I could stand at the hub and glance down each row and see if any robber bees were threatening any colony, and in swarming time I could see from which colony the bees issued, with the least expense of labor or time.

When I commenced bee-keeping I thought it necessary to have the hives 5 or 6 feet apart each way, but want

5 or 6 feet apart each way, but want of room caused them to be placed nearer, and I now find one foot apart in the rows to give ample room.

East Saginaw, Mich., July 20, 1881.

Mr. Henry Jones, of Chesaning, Mich., presented a box of honey to the editor of the Oakley Cyclone, who "noticed" the honey in the following words:

Mr. Jones, of Chesaning, will please except our thanks for a cap of that superb honey of his, which he kindly presented to us, and which was pronounced immense by all the young Cyclones in the family, which includes one little zephyr, and several small whirlwinds.

That little local notice will do much to assist Mr. Jones to sell bis honey at home, and thus create a local market for years to come. We cannot give better advice than to keep the local market well supplied—send up only the overplus to the large marts.

A commercial exchange says that the American honey trade with Great Britain is growing rapidly. A recent English order calls for 58,000 one-pound cans of pure extracted

. . .

Mr. Fisk Bangs, of South Haven, Mich., who resides in the great fruit belt along the lake, gives the dispiriting information of the "almost total failure of the peach crop. Apples, too, except close to the lake where he

#### The Old, Old Story.

We cannot resist the temptation to publish the following:

South Haven, Mich., Aug. 30, 1881. We regret that the management of both the American Bee Journal and Gleanings should have resolved upon such action as they have, resultring in our financial embarrassment. Presume it's no use for us to repeat that we are paying fast as we can.

II. A. BURCH & Co.

We can assure Mr. Burch that we did not "resolve upon such action" until the complaints against him became so numerous that we could no longer doubt much of his business was tinctured with "crookedness" (toput it mildly). For nearly two years we have heard more or less of complaint, and have remonstrated with him for his lack of promptness; but more recently we have been much censured for carrying his name in our advertising columns, which we should not have done had we not supposed he was at least honest; but when statements of his derelictions were received, subseribed and sworn to by numerous victims, "the management" could not do otherwise than "resolve upon such action." Mr. Burch had passed that "point beyond which forbearance ceases to be a virtue:

The assurance of Mr. Burch, that "we are paying fast as we can "may be gratifying to some, but there are many, probably, who look upon orders on the "management" of Gleanings, by Mr. Burch, for the repayment of money sent him for bees and supplies, in about the same light that Dr. E. E. Worthen does.

The South Haven, Mich., Scatinel. of Aug. 27, gives the promised particulars of the case where Mr. Burch has had money for goods over two years. and yet the order is unfilled, and adds:

With such charges staring him in the face, we should like to know how much cheek it required for Master Burch to write to the Bee Journal, "If you feel like saying in the Bee Journal that you regret our being so much behind, but are assured that we will make all satisfactory as far as lies in our power, we shall feel grateful."

Another Dishonest Dealer .- In the September number of Gleanings, we find the following allusions to another of those swindlers who would bring disgrace upon any respectable calling they might adopt:

Lebanon, Mo., Aug. 15, 1881. I drew on G. W. Marshall for the pay for his advertisement, and he re-pudiated it, and we drop his card; and if any one has lost money by reason of his ad. in our Journal, we are ready to E. M. HARRISON. make it good.

[That is business, friend Harrison, and here is our hand on it. Let us suffer long, and be kind, but when a man repudiates his honest debts, he should be held up as a warning.]

And yet, under the editorial head of the same paper whose publisher condemns this G. W. Marshall, we find him accredited, as late as the August number, with being its regular subscription agent, and he has been so announced during the whole season. We learned years ago, through business transactions with him, that this man Marshall was dishonest, but we do not propose to admit a particeps criminis by assuming any of his obligations, or refunding moneys he has swindled patrons out of.

#### MISCELLANEOUS.

Large Crop of Honey in Canada. - The Woodstock, Ontario, Canada, Sentinel, gives the following account of Mr. J. B. Hall's apiary and crop of honey for this year:

In a very recent conversation with a gentleman who had been long and intimately connected with bee-keepintimately connected with bee-Keeping he declared that every township in Canada was annually losing \$10,000 by failing to keep as many bees as would gather all its honey. Such a waste of our productive wealth is really startling, and it is satisfactory to know that it has not account or ways. Woodstock. A visit to the apiary of Mr. J. B. Hall on Drew st., will convince anyone that Woodstock's honey is all collected. Mr. Hall has now no less than 250 thriving colonies of bees, and has this year obtained over 6,000 pounds of honey. He reports the year as a fairly good one, and seems highly pleased with the signal success that has attended him as a bee-keeper. A visit to his apiary on Wednesday proved both pleasant and instructive, and we recommend all who are interested in bee-keeping to go there too.

By the same paper we notice that Mr. Hall has taken unto himself a bride-Miss Mary Adams-and the BEE JOURNAL wishes that their honeymoon may be their light and sweetness all through life, and always be provided with a sufficient store of bee-bread for their numerous brood. Mr. Hall is to be congratulated upon the successful re-queening of his chief hive, after it had been queenless for two years. It would have been an impossibility with bees.

Biographical.—The following is an extract of the biography of the late editor of the Bienen Zeitung, found in that paper of June 15th, for a translation of which Messrs. Greiner Bros. have our thanks:

Herr Andreas Schmid, editor of the Bienen Zeitung, died in Eichstedt, May , after a long, suffering illness, in his

2, after a long, suffering illness, in his 65th year.

Not far from Regensburg, in the small village of Grunthar, Andreas Schmid was born, on Feb. 25, 1816. His parents, Andreas and Ursula, were in very moderate pecuniary circumstances, and the support of the family, consisting of 2 more brothers and I sister, caused them frequent denials of many necessaries of life. The fact, that a piece of wheat bread or an apple was considered a rare "holiday" treat, sufficiently illustrates their circumstances. treat, sufficiently illustrates their circumstances.

When 6 years of age, he was sent to Irlbach to school; his chance for educational advantages was here any-thing but encouraging, for the teacher himself could neither read nor write. himself could neither read nor write. He soon distinguished himself above his schoolmates, which attracted the attention of the village parson. He was frequently invited to the parsonage, where he found occasion to add little by little to his education. He also made himself useful about the house and garden, wherever an oppor-

and the Government sent him, in 1836, and the Government sentimm, in 1850, for his final education to the capital, Munchen, and t year thereafter to the Teachers' Academy, in Eichstedt, as assistant principal. His labors in this position so occupied his time, that he was engaged from 5 o'clock in the ways grantil that night daily leaven was engaged from 5 o'clock in the morning until 10 at night, daily, leaving him only the hours of the night. Sundays and holidays to attend to his private affairs. The Government sent him again in 1853 to Munchen, to study chemistry, and in 1867 back to Eichstedt, as principal. The agricultural department of this institution, included anientime in its studies, and Analog anientime in its studies, and Analog anientime in its studies, and Analog anientime in its studies. department of this institution, included apiculture in its studies, and Andreas Schmid found it necessary to fit himself theoretically and practically for its teachings. He purchased at once bees, which he placed in the garden of the Academy, and the students received, under his management, daily instructions in practical beekeening. Many of these students. the the cause; in later years, when scattered as teachers over the country, they became distinguished bee-keepers, encouraged others in the pursuit, founded Bee-Keepers' Assofollowers. His example found many followers. His labors and zeal in ad-vancing the cause are duly apprecia-ted by all the German and Austrian bee-keeping fraternity, and he always lived as an unselfish, noble and con-scientious friend and adviser in the memory of all that knew him.

Handling Bees without Smoke.correspondent in Gleanings remarks as follows about handling bees without smoke:

" When we throw away fear entirely, I think smoke is of little or no use, believe we can handle bees the y round, and do it with more satisfaction round, and doft with more satisfaction and better results by leaving smoke entirely out of the apiary. If instead of going to a hive, jerking the cap off, tearing off the quilt, and blowing in smoke to arrouse the colony to a light-inguisted was really be a various grid. ing pitch, we would be cautious, raising the cap easily (a cap that will not come off without jarring the hive has no business in the apiary) raise the quilt slowly, without jarring, avoid all quick motions laying the quilt to one gark morious raying the quilt to one side, and then pick up the frame, or rather, commence picking it up, draw it out slowly. You will then have no trouble, even with black bees, running over their combs, scared to death. If they fly in your face and alight on your hands not one in twenty will sting you hands not one in twenty will sting you If you just pay no attention to them. I have discarded smoke almost entirely."

Why do you not discard the smoker entirely, if its use is unnecessary; why say "almost entirely?" strong colonies of bees, during a brisk honey flow, the practical bee-keeper would make but little headway in manipulating his hives without smoke, unless provided with a skin as impenetrable as that of a rhinoceros and perfeetly reckless regarding the number of bees killed.

Both Sides of the Question .- Mr. T C. Hagaman, of Benton Harbor, Mich., the great fruit region of the west, on the subject of bees injuring grapes, remarks as follows, in the Benton Harbor Palladium:

also made himself useful about the house and garden, wherever an opportunity was offered, but especially when this parson, who was a lover and keeper of bees, was engaged in handling the bees. Having a natural liking for these little insects, and being encouraged by the parson, he probably formed here the love for the calling he so faithfully pursued in after years. From his 18th year he went to high school, at Regensburg; his untiring perseverance in his studies, soon distinguished him here also, As I have an interest on both sides

gray bird had put its bill through the grape the bee would then follow, as they say of the grave-stone peddler, after the doctor. I have frequently after the doctor. I have frequently seen the birds on the grapes and driven them away, and found that where I saw the birds most frequently they were punctured upon the upper side of the cluster—2 or 3 holes, sometimes, in one grape, over 1g of an inch across, with the skin of the grape lapping down inside, showing very plainly that the bee could not make such an incision with its small proboseis. The grapes in the lower portion of the cluster were almost invariably sound. The bees will not wait for an invitation to work upon fruit that has a broken I have frequently the bees will not want for an invitation to work upon fruit that has a broken skin. That is a part of its economy in providing for its future wants. Can any one blame it for this? I do not, and while I love good fruit I also love good honey and enjoy taking care of the bees although they do not, shore the bees, although they do play sharp on me sometimes. From my observations I have no reason to believe that the honey bee does in any way injure fruit, and I believe that this charge laid at the door of the honey bee is entirely without foundation.

Bees in Southern California.-We condense the following from an article which recently appeared in the San Francisco Examiner. Evidently the estimate of the honey crop this year is too large, as it will fall far below an average :

The extent to which honey-making is carried on in the foothills of these extreme southern countries is something remarkable. Careful estimates, by responsible, well informed apiarists, place the number of hives being worked this season in the three comties of Los Angeles, San Diego and San Bernardino at nearly 200,000. There are at least 600 men wholly engaged in saving honey this season, and an average crop is assured. Last year average (70) is assired. Last year the honey crop of San Diego county amounted to 1,291,800 pounds, and this year it will be larger. The total crop of Ventura, Los Angeles, San Diego and San Bernardino will not fall short if it does not exceed 3,000,000 lbs. short if it does not exceed 3,000,000 lbs. this season—at least that is the opinion of well informed apiapists. The growth of this business has been very rapid, and may now be said to be in the zenith of prosperity; for, as the sage, sunac and other honey-productive deverges and other honey-producing flowers and shrubs decrease, so also will the number of bee colonies, also will the number of bee colonies, now so numerous along the southern coast range.... In 1877 there were only 22 bee ranches in this southern region; now there are not less than 500. Five years ago the crop of honey was little in excess of home consumption; now several large ships can be loaded with the crop of a favorable year.

The bee-keeper usually lives upon government land, not because he is unable to purchase what land he re-

unable to purchase what land he requires (which is a small amount) but because the wild sage, button sage, sumac and other honey flowers and sumac and other honey flowers and shrubs are found growing luxuriantly where land considered worthless for grazing or cultivation is left unclaimed and undisturbed. In almost every accessible gulch, gully and valley where water can be had—and where the white sage blossoms, a bee ranch may be discovered. They are solitary places, veritable hermitages, whereintruders from the outside world never find their way. Many of them are very beautiful little rural gems, set within a bower of roses and honey-suckles; some are merely a shed among suckles; some are merely a shed among rocks and brush, devoid of taste or comfort. These bee-raisers cultivate a sort of freemasonry among them-

For the American Bee Journal.

#### Honey Producing Plants.

G. W. DEMAREE.

The value of the locust tree, commonly called black locust, as a honey producer, I think is not as generally known and appreciated, as the true merits of the tree deserves. The fact that Prof. Cook, in his Manual of the that Prof. Cook, in his Manual of the Apiary, merely gives this tree a passing notice, indicates that it either fails to give the best results in many parts of our vast country, or the tree is not as well known as it should be. The time of year in which it blooms nearly filling the interval between the late fruit bloom, and the white clover, welves it an exceedingly valuable anymakes it an exceedingly valuable auxiliary to the honey harvest in the middle states, if not elsewhere. It is a most profuse honey bearer, rivaling the famous inden in quality, and only inferior to the product of the latter in color. Locust honey cannot be said to be dark in color. It is of a rich pulebe dark in color. It is of a rich pale-red color, when in a liquid state: but when in the shape of comb honey, its appearance, if removed from the hive when first finished, is but little infe-rior to our superior clover honey. It becomes exceeding thick, if left with the bees till the cells are thoroughly sealed, and its keeping qualities are therefore most excellent. We have used it on our table when first ex-tracted, and after it was a year or two old. Many persons have partaken of it, all of whom have pronounced it ex-tra good. The farmers in this part of the state are planting thousands of tra good. The farmers in this part of the state are planting thousands of the state are planting thousands of these trees, for the valuable tumber they furnish for fence posts, telegraph poles, and for all purposes where dur-able timber is needed. The locust is a rapid grower, and is quite free from disease. I have seen it bloom the sec-ond year after transplanting. The ond year after transplanting. The trees are planted by the side of fences, in waste places, and on poor worn out lands. They may be propagated from the seeds, or by transplanting the young trees from 1 to 3 years old. If the ground is plowed in the spring, and the locust seeds planted on the little with a surface or with other hills. hills with corn, or with other hill-erops, and cultivated the first year, erops, and cultivated the first year, the young trees will grow with great rapidity, even on very poor lands. In this way beautiful groves can be started, making the land, in process of time, very valuable, in locations where timber is an object, besides giving a perfect sea of bloom, ladened with precious pretar. with precious nectar.

ery bee-man knows that a mere patch of bee-forage amounts to but little. If we are to have great results in the way of yield of hopey, we must have a sea of bloom to obtain it from. Now that this new source of bee-pasturage is being so rapidly developed, all unconscious to the farmers who an unconscious to the farmers who are planting and training these trees by the thousands for their valuable timber, some change must necessarily take place in the management of bees in the early spring. Our colonies must be made strong enough to harvest the tons of nectar secreted by the locust bloom in the short space of about 10 days. I had a few colonies last spring strong enough to teach me

what may be gained from this source.

Commencing with empty hives, the queens were crowded out in 4 or 5 days, after the locust bloom opened. With strong colonies and plenty of empty combs, the amount of honey attains and made and the strong colonies and plenty of empty combs, the amount of honey attains and made and the strong colonies. obtained would depend much on the good management of the apiarist. It is no easy matter to get bees strong enough by the 10th or 15th of May to give the best results. Some of the best colonies can be depended upon, but to get an entire apiary ready for strong quick work, is another matter. I know of but one way in which it can be accomplished, and that is to unite plenty of bee-bread showing signs of

months of time, and if our bees must be built up during these precious days, the season is simply lost to the apiarist. What matters it, though we increase our colonies of bees, if they

are never ready to reap the barvest.
Uniting bees in this climate gives
them the swarming fever, most awfully bad; but even this is preferable to doing nothing.

#### Pollen Detrimental to Wintering.

JAMES HEDDON.

"In our common ignorance, all have an equal right to guess."

Some time ago I threw out the bac teria hypothesis, to be thought of and weighed in the scales of others' expe-But little has been said about the subject have spent most of their force in trying to pin it to me, rather han to disprove the correctness of the

You will see, by the records, that I You will see, by the records, that I mever failed to assert that I mad not seen the animal," "did not know it existed," thought it might be "vegetable matter in the food," (I gnessed table matter in the food" (I gnessed in the honey), and now, after carefully examining a large number of dead colonies of my own and among my neighbors, I have settled down upon the belief, strong and positive, that the trouble is "vegetable matter in the food," not, however, in the honey, but in the cell-joining—that dysentery is caused by the consumption of beetable matter in the food is caused by the consumption of bee-I stand 10 to 1 on this question. I understand that when any animal is forced to consume of food several times its bulk and weight, and that, too, without any voiding of excreta, which is its natural habit during anwhich is its natural habit during another season, that food must be of a highly retined and oxygenized nature, or disease will be the natural result.

I do not believe that bee-bread can

be eaten during the period of confine-ment, and good health to the bees be the result. That they do try to use it the result. That they do try to use it in place of their natural food (honey) and that their failures are well known and fully realized by us. I am sure

but few agree with me, it is comforting to feel satisfied as to the cause, and that step having been taken up the hill of science, we can now prepare to search out the cheapest and most effectual method of prevention. I see that others have come to the same conclusion, and I have faith that the preventive is near at hand. The unaccountable phenomenon of Smith's bees all dying, while Jones', treated the same, and only three miles distant, all or nearly all live, shows the fallacy of looking for a cause in "cold," "confinement," "dampness," or any of the popular theories. None of the supposed causes will agree in the effects as we are forced to find them. I think the consumption-of-bread the-

ory will.

There are more than a dozen different causes for the consumption of bread, which vary in the extreme in different winters, and in different lo-calities only a short distance apart.

calities only a short distance apart. I will mention a few: First, I believe that the consumption or preference for honey, and not bread, during all that period when bees must void no excrement, except by sensible and insensible perspiration, is a fixed fact. The cause of dysentery is a variation from that rule, and the winter consumption of bread by the older bees; the attractive quality of the bread vs. the closer proximity of bread, or more easy of access than honey (continued easy of access than honey (continued cold spells affect this largely); disposition to breed, in which case the bees being forced to handle the bread to feed the larvæ, eat of it more or less themselves. I have not found a dead

2 or more colonies together. This I shall do hereafter without hesitation. Our honey seasons (even the best of them), are crowded into about 2 brief colonies that died late of starvation. With those that had accessible pollen, and tried that as a last resort, dysentery is to be seen in greater or less de-gree; but with many that had little or almost no pollen in the combs, all the bees and combs are as bright as any live colony. The sources, and consequent time of excessive fall pollen gathering in different localities only 2 or 3 miles apart, varies greatly, many times even more so than the gathering of honey.

Allowing this to be the cause, it is not the easiest matter in the world to foretell by examination, late in the season, whether colonies are going to diegenerally or not, because the pollen in the combs will not decide the future result; much depending upon its position in the combs at the dangerous sition in the comos at the dangerons time, and its attractiveness as com-pared with the honey as they may exist then, also much upon the frequency with which the bees can have a thorough voiding flight, and the excess of the cold, which governs to a large extent the amount of food consumed.

In a large majority of the cases In a large majority of the cases where sugar syrup has been used, the reports have been favorable. I can only account for it on the supposition that the quantity and quality of the food was such that it was much preferred to the pollen, and exclusively used, and during the process of feeding much of the pollen that would have otherwise been left, was conhave otherwise been left, was consumed or removed. In those cases where bees fed exclusively on sugar syrup have died with the disease, the pollen was eaten, sugar or no sugar.

The best method of prevention is

what interests me most. I have given the subject but little thought as yet. I have given owing to the summer's rush of work and I do not think of any method sufficiently speedy, safe, cheap and sure to warrant its adoption in preference to taking the chances of success withont cost or trouble.

It occurs to me that Mr. Grimm's plan of inserting two full frames of scaled honey (previously stored away for the purpose) in the center of the brood chamber is good, I would add the tollowing precautions: have these two combs free, or nearly so, of pollen. Remove three combs containing the most pollen, leaving the space in the center of the hive, in which space in most pollen, reaving the space in the center of the hive, in which space in-sert the two honey frames. The extra space, as recommended by many, I think I would like very well, though I would not create it were I not going through a more important manipula-tion, in which case I could do so as

well as not.

Another, and perhaps better plan. would be to remove the three frames containing pollen as before, and insert the same number of empty, straight, all-worker combs in their place, and feed them full of properly made sugar syrup. This should be done immediately. syrup. This should be done infined; ately after all gathering is over, and not later, and the feed should be given from the top, and directly over these three center combs, from a capacious feeder, or several feeders if smaller, to the end that the feed may be taken because and couled up as good to possible. down and sealed up as soon as possible, and care should be taken against inciting the bees to robbing, which can be avoided. If part of the stores are not sealed no harm will result from it. Place two bent sticks over the tops and under the cloth or cushion thus,  $\sim$  , to give the bees free access among the combs during the latter part of winter. This plan might pay even in large apiaries, especially if the colonies world work stores than they had on needed more stores than they had on

I think even feeding light colonies with white sugar symp is largely a preventive of dysentery. While honey of any color or flavor might be as good a food when eaten, still I suspect that sugar syrup has an extra attraction for the bees, that induces them to use it to the exclusion of pollen. Some simpler, cheaper and less com-

that period when they are obliged to semi-hibernate, is what I most desire. I still believe that there is a differ-

ence in races and strains of bees in regard to their wintering—bees that breed earlier are in most danger. My colonies that were not packed wintered best, but were summered in another field. More than nine-tenths of the bees about here perished, while I saved over one-third of mine. Those in box died worse from some causeprobably chance

Dowagiae, Mich.

For the American Bee Journal.

#### My Early Experience with Bees.

MRS. M. L. PARSONS.

We began the season of 1879 with 2 we began the season of 1879 with 2 colonies of Italian bees, one of which was quite inferior. Our expenses, including cost of bees were \$24.25. Recompense for our labor was 1191bs., box honey, 60 lbs. in frames, and increased stock to 6 colonies; left them for winter 7 frames of good capped honey; put chaff cushion on inner side frames; filled covers with chaff, and packed a faot or more of straw around and over them. They took but one general flight, Jan. 4. We opened them April 1; they were bringing some pollen; inferior queen had but a handful of bees. One young queen, superseded by a laying worker, gave me much trouble; remaining 4 had brood in all stages, some cupped; 1 colony killed the queen in April, so we had, May 1, 3 good colonies, and 2 queenless ones.

We then bought of the Misses Wilkins, 16 colonies of as beautiful Italians as one could wish. With 2 sample hives, frames, etc., they cost us, delivered at our station, <sup>3</sup>4 of a mile from home, \$149.74 cts. Our hives, frames, sections, section frames, shipping erates, separators, 4-frame Everett extractor, etc., brought our to-tal expenses to \$341.70, all but sections being a permanent investment. From the 19 colonies with which we began in 1880, we have 847½ lbs. comb, 530 lbs. extracted honey. 11½ lbs. wax, and have increased to 47 colonies, and have increased to 47 colonies, each of which made from 30 to 35 lbs. each of which made from 30 to 35 lbs. of good capped honey. When packed, Nov. 8, some queens too, had a little brood and some eggs. We bridged over entrances, packed 8 inches of hay over entrances, packed 8 inches of hay in front, 12 or more at the back, and filled entire space between the hives (about 3 feet), with hay; have a duck sheet, woolen blanket and cotton quilt over frames. A good tight roof protects them all. Every queen has a name and number, my book giving credit to each the work of her own colony. Our dark bees gave best returns, "Nettie Carr" with 104 10-16 lbs. comb honey, besides some extracted. We get 16 cts. for comb, and 124 for extracted honey, at Bay City. There was considerable buckwheat within reach of our bees, but either it There was considerable buckwheat within reach of our bees, but either it secreted no honey, or the bees liked other plants better, for we have no dark honey, some of the last taken being as white as linden. We took every section from the hive as soon as finished; at close of the season extracted from unfinished sections. Use 51<sub>4</sub>x61<sub>4</sub> sections; adopted Miss Wil-kins style of hive, the 10-frame American, with Doolittle hive for surplus honey, enlarged to take American frame

We have used the Van Deusen We have used the van Densen foundation, both in frames and sec-tions, successfully. Used at the last sheets that nearly filled sections, and like those best, Shall try the Dun-

like those best. Shall try the Dunham foundation this season coming.

We lost some young queens, by their either not returning at all, or to wrong hive. I rescued 2 that were balled, and put them in the right hive; had 5 queens fly from frames while in my hand, 2 of which were laying, re-turned, but the 3 "foolish virgins" I never sawagain. We united several colonies without loss, by use of atomito the exclusion of pollen.

Some simpler, cheaper and less complicated method of causing the bees to abstain from eating pollen during all

board in front of the entrance, but

none returned to the old stand.

We give our bees the closest attenwe give our overstand chosest attention, having discovered they do not work for nothing and board themselves. Mr. Parsons and myself often being with them from 4:30 a. m. till dark. We are working to succeed. I see nothing but praise for "sweet clover," but from our experience with it east, I should as soon think of sowing Camada thistles; I think those who advocate its introduction can't beforemore.

farmers.
Perry Station, Mich.

[We have heard but little complaint from practical farmers regarding melilot or sweet clover.  $\,$  1t certainly is no worse to eradicate from the ground than ordinary weeds, and should not be compared at all with thistles, nor even with Spanish-needle, while its superiority as a honey plant should make it a great favorite with all keeping bees, if but a single colony.—ED.]

#### The Origin of Drones.

A. R. KOHNKE.

Mr. Robinson's hope, that some professor will deign to write an essay on this subject, will probably be in vain. this subject, will probably be in vain. Such a waste of paper and ink could hardly be asked of a person conversant with the subject, as all intelligent bee-keepers are. He may as well try to refute Euelid, and then ask some professor to write an essay to prove this illustrious mathematician correct. This article is not intended to gratify Mr. Robinson's hopes. To arrive at certain truths and facts through a course of reasoning hopes. To arrive at certain truths and facts through a course of reasoning, is, perhaps, beyond his ability; or he might understand them, if given by others, which he seems not to do. But I would like to ask him a few

out t would like to ask him a few questions, namely:

1. Has Mr. R. a microscope of 1000 to 2000 diameter power?

2. Has he ever seen the sperma of any animal through such an instrument, especially that of a drone?

3. Has he ever dissected a worker or drone egg immediately after being brid?

1. Fig. 1. immediately after being laid? If he has not, he should do so, in order to obtain ocular proof of what has been known as a fact since 1855, instead of known as a fact since 1855, instead of questioning the authority of men who have made entomology a life study. Referring to von Siebold Leuckart, and Donhoff, he says: "Those men fancied," when the "fancy" is exclusively his own. For it was von Siebold who, in 1855, proved by ocular demonstration, in von Berlepsch's own apiary, the theory advanced by Dzierzon. His assertion that von Berlepsch was in the dark is therefore without foundation. fore without foundation.
Youngstown, O., Ang. 26, 1881.

For the American Bee Journal.

### Are the New Races Superior?

A. F. MOON.

Candidly speaking, never since the publication of the American Bee Journal, has it stood so intrinsically high as it does at the present time, and it owes the position it now occupies in the nation to the untiring energy and unselfishness of its editor, and the in-telligence of its numerous correspond-ents. What a change has come over its face.

telligence of its numerous correspondents. What a change has come over its face!

I was forcibly struck in reading the editor's answer to Mr. Johnson, on page 252 of the BEE JOURNAL for Aug. 10, regarding the best bees. In your free, outspoken answer, you have now placed the matter where the advocates of this class of hees will got about the control of the class of these will got about the control of the class of the

its breeders, that it is a difficult matter to distinguish the Cyprian from the Italian. This being a fact, and the Italian. This being a fact, and the probability of the two races becoming mixed, any one can perceive the great injury that will be done to those breeding the Italians. I long ago had my fears aroused, and more especially after reading Mr. H. Alley's description of them in the Bee Journal, and concluded the less such stock beeand concluded the less such stock beekeepers had to contend with the better, if we expected to make any improvement in the Italians. Further, I cannot see how any queen-breeder, rearing all or any of these bees in the same apiary, or within two miles of each other, can keep any one strain pure. If fertilization could be controlled, then we could do better. From the description of these bees, not one bee-keeper in five hundred can tell the description of these bees, not one bee-keeper in five hundred can tell whether they are pure or not; and to talk of purity, or keeping them pure, is all nonsense. We want to hear from some of their advocates. I see that quite a number are advertising them, and hope they will not all speak at once. Let some one who knows of their good qualities tell us what they are, and if the Italian bee proves the best, abandon those which are inferior, and not fill the country with stock that will mix the races, thereby lessening, instead of enhancing, the value of the better stock. Remember, we have had instead of enhancing, the value of the better stock. Remember, we have had great trouble in keeping the Italian bee in its purity, and now we have a double dose to contend with. I certainly would be glad if a better bee could be had, and that I long ago predicted would be obtained by the improvement of the Italian. But new things and wild speculation often sweep over our people at a fearful rate. Some 35 years ago the Morus multicaulis fever raged to a fearful extent, and all wanted the mulberry and silkworms. So with our bee-keepers; they caught the fever for the Holy Land, Hungarian and Cyprian bees, not being content with our excellent not being content with our excellent Italians.

It now turns out that the most prac-It now turns out that the most practical bee-keepers of this country condemn them, although they have advertised them for sale; but no doubt, like some others, they learned their qualities. If such bee-men as Chas. Dadant are not competent to judge of their qualities, etc., it is useless to look further. Although some good breeders like them, I would like the modus amountait for breeding so many races operandi for breeding so many races and keeping them pure. If they can-not keep them pure, who would want

Fall rains have set in, and bees are

#### Methods of obtaining Surplus Honey.

J. O. SHEARMAN.

The main thing is to obtain a good location, for, if the bees gather but little, the bee-keeper will have less.

The above heading relates more particularly the state of the

The above heading relates more particularly to management with the means we may have at hand. I shall, therefore, give some personal experience, as it seems to me that we gain more information by comparing ways and means than by theory merely.

I like a hive with the back for a division board, so that the brood chamber can be made smaller or larger in

vision board, so that the brood cham-ber can be made smaller or larger in proportion to the amount of bees. I have obtained some of my best results by reducing the hive to so few frames in the spring, that the bees will mearly cover them, and keep them in that proportion till surplus begins to come, editor's answer to Mr. Johnson, on page 252 of the Bee Journal for Aug. 10, regarding the best bees. In your free, outspoken answer, you have now placed the matter where the advocates of this class of bees will certainly be obliged to step to the front with the proof of their superior qualities, should they possess any; if they do not, the sooner they abandon them the better it will be for all parties concerned.

It appears from the accounts given of the Cyprian bee, even by some of

In a poor season any average colony of bees can be controlled in this way, and I have run some strong colonies through a good honey season with good results, and no swarming, by tiering up surplus too; but it takes too much time to run a large number in much time to run a large number in that way, in a good season, and we are sometimes pushed to throwing back swarms, or else increase, which is undesirable when we have enough. In regard to the style of surplus, extracting is generally allowed to give the greatest quantity, but it was rather a failure with me during the past season. For this reason.

past season, for this reason:

Honey came in about fast enough to induce brood rearing, and both stories were near filled with brood while the flow lasted; when it had passed, there were many more young to feed instead of to gather surplus; for our surplus came in short runs, some-

Glassed boxes seem to be the most convenient to handle, as they can the more readily be seen when full and taken off independently, and it is the most work done over the centre of colony. It is a glow and musey ish to It is a slow and mussy job to nge places with sections before exchange places with sections capping, as we often do with boxes. It is quite an object to be able to put on as much room for surplus as possi-ble at times, as bees often gather more than they can cap, in wet weather or a heavy flow. But if tiered up, the top is seldom as well finished or as full as the under tier. Sections, if put in the body of the hive in the brood frames, are apt to have pollen stored in them. They also cost more to crate, and in breakage, in handling or shipping. There are also more cells than in There are also more cells than in boxes, though honey in sections sells quicker and at a better figure, and it is, therefore, a more desirable shape, when a person has the time to spend

New Richmond, Mich.

#### Bee Culture for the South.

O. F. BLEDSOF.

We hold that a people to be pros-perous, must deversify their pursuits, and develop in every direction all the resources of their country. Nothing that tends to the sustenance and comfort of human life but that deserves attention. Northern people (to their credit be it spoken) pursue with the keenest intelligence and ardor, all branches of industry, great and small.

Nothing that their country will develop is neglected. They even force churlish nature to be partial to them. They have taken the minor pursuit of bee-culture, and brought it to a sys-tematic and renumerative branch of industry, though they are compelled to house their bees during the winter, even then losing vast numbers each winter, and in summer have only lim-ited seasons of bloom.

The natural advantages in this pursuit are in many respects with the south. Here no extra care is required in winter, and our bloom is more continnous, though we are not prepared to say that we ever have as great a flow of honey as is sometimes given by the basswood and white clover of

the north.
Still our honey resources are undeveloped, and we might, in some sections of the south, excel anything yet

achieved by the north.

We know not what we can do until we know not what we can do that we apply intelligence to the pursuit, and adopt the modern system of bee-eulture, which consists, first, in an exact knowledge of the honey bee and its habits, to be obtained from works like Langstroth's and other newer

ones, and the current bee periodicals.
Second, in the use of the movable frame hive, so that the entire contents of a hive can easily be taken out al any time.

Third, in the use of the extractor

and other appliances and inventions.
Fourth, in the use of Italian bees, which are more prolific, industrious and hardier than the common black

bee. They are very beautiful, having yellow bands across the body. They are very gentle, and with the aid of a bee smoker and a veil, one need never be stung in their management. They are moth proof. The bee moth or worm never disturbs a strong colony of Italian bees. I have placed a comb full of worms in the midst of a strong colony of Italians, and in a few min-ntes the worms were writhing on the ground. I have taken 100 lbs. of honey from a single hive of Italians in a season, and consider that amount as not extraordinary. As much as 500 lbs. have been taken from a single hive in a season in the state of New

York.
We hold that bee culture is a highly We hold that bee culture is a highly intellectual pursuit that would be a pleasant and profitable recreation to thousands of farmers, if they would go at it right, and that if it were carried on in Mississipi, as in the north, it would go far, directly or by exchange, toward supplying our people with all the liquid sweets they consume—a result decidedly in the direction of "the glorious privilege of being independent."

Grenada, Miss.

For the American Bee Journal.

#### Fertilization in Confinement.

C. J. ROBINSON.

We occasionally read of fertilizing in continement (that is copulating with drones while inclosed in a coop). On page 66, vol. I. of the BEE JOURNAL, the Rev. L. L. Langstroth furnishes an account of an ocular demonstration. stration by Messrs. Cary and Otis, of the queen and drone bee, which I could not indorse as correct at that could not indorse as correct at that time nor since, the position of the two. The drone clasping the queen around

The drone clasping the queen around the body, etc.

The architect of nature has so arranged the gentle parts of the drone and queen, that it is physically impossible to make their genital parts meet with the drone on the back of the queen. They must be reversed, and the queen clasping the drone with her legs, and driving the drone down in close contact with her body with a quick motion, the genitalia are thrown out into the vulva of the queen, by quick motion, the genitalia are thrown out into the vulva of the queen, by which means the copulation is accomplished, which it is known that the queen could not do if disabled in her legs or wings.

Take a live drone, and by a gentle pressure between the thumb and finger, it will cause them to throw out

ger, it will cause them to throw out their genitalia, which curves over to-wards the back or head, with a joint about <sup>1</sup><sub>3</sub> of the length from the end, which end curves downwards with double barbs at the underside at the joint, and is composed of a very thin membrane filled with compressed air, and the semen also thrown up (that is contained in the 2 horn-shaped sacs situated at the base of the geni-talia) with sufficient force to burst the sacs situated at the base of the geni-talia), with sufficient force to burst the end, and the semen is thrown out leaving the inside casing of the sack which is held by a thread-like tendon, attached at the base, the same as am-mals after giving birth to their young. On my theory of reproduction of queens, the workers that attend the drones on their excursions cause them to give off semen, which they convey to their hives to perfect queens, which also accounts for the cause and use of so many drones, as they expire immediately on giving off their semen. See what nature has done to accomplish that design—in so done to accomplish that design—in so constructing the drone that a slight pressure of the abdomen, by the legs of the worker or queen, or the lingers, to throw out the genitalia, if the worker is clasping the body to obtain royal jelly, or the queen to get semen into her spermatheca. In this, the drone is like some plants: when ripe, with a slight pressure the seed vessels explode and throw off the seed.

It seems evident that the Creator had some further use for the drone

had some further use for the drone than barely to copulate with the queen. I have watched the drones

and workers as they issue forth from the hive, and take their dight to-gether, the drones appear as if fired with the love of reproduction of their race. The foregoing theory shows the use and wisdom of God in causing so many drones at times and O... so many drones at times, and the mystery is made plain in the perfecting of queens in the absence of drones, by the impregnated worker-larve with semen. The queen must fly out be-fore becoming fully fertile and a persemen. feet queen, and have a connection with a drone and her spermatheca, filled with semen, which is done, as indicated in the foregoing. I have caught a number of drones and held them in my hand until warm; then a gentle pressure between the thumb fingers will cause them to throw out their penis and the thin mem-brane bursts at the extremity, and the semen is thrown out. I then placed them on a board, and then procured working bees, the same as in hunting wild bees, and they licked up every particle of semen, thus extracted, and conveyed it to their hives.

My theory as indicated in a former article, is the only one yet offered that satisfactorily explains the phenomena of inhabitants of the hive coming forth in changeable and changed sexual forms, and what is now admitted to be the history of the bee, in accordto be the instory of the bee, in accordance with the instructive laws given them by the Creator. And by looking at the subject from my stand-point of observation, the reproduction, as set forth in said former article, of the 3 kinds of bees, becomes plain and rational

Richford, N. Y.

For the American Bee Journal.

#### The Three-Band test for Italian Bees.

G. M. DOOLITTLE.

On page 219 of the BEE JOURNAL are these words:

"Are we to accept as true the absurd and illogical doctrine, propagasurd and inogreat doctrine, propagated by some vendors of queens and bees, that a queen whose progeny must be filled with light-colored honey, and placed upon a window in order to exhibit the faint outlines of 3 precious bands, is just as pure as a green whose progeny shows the organization. queen whose progeny shows the or-ange-colored three bands under all circumstances?"
In answer to the above question, or

a similar one, A. I. Root says that such is the test that must be applied to the progeny of some queens, imported direct from Italy, in order to see the 3 yellow bands. If such is the case, then we must conclude that the window test is sufficient, or else that no certain purity exists in the long continued home of the Italian bee. Then we must also conclude that the purity of the Italian bee consists in what is called "thoroughbred," what is called "thoroughbred," rather than their being a distinct race or variety of bees, if we do not accept

the window test. Once more; if the window is not as acceptable as the 3 orange-band test, and that the bees showing the latter are the preferable ones, where the need of farther importation from im-

pure Italy.

I wish to say a few words about those orange-colored three bands which show under all circumstances. I have show under all circumstances. I may had queens from nearly all breeders in the United States, and queens which produced workers, a part of which showed the fourth band as plain as most Italians show the third; still I have yet to see the oneen whose still I have yet to see the queen whose progeny not only showed the three and four yellow bands, but also the shield, said to be a characteristic mark of the Cyprian at a certain age, yet at other stages of their existence they would not show the three yellow bands under all circumstances.

It will be seen, I claim the age of the to will be seen, I claim the age of the bee has more to do with this three yellow band business. If we look at the young bees as they crawl on the combs from the time of hatching up to 5 or 6 hours old, we shall find that unless the abdomen is curved, there will but few look at the would have hours old, we shall find that unless the abdomen is curved, there will but few look at the would have hours old, we shall find that unless the abdomen is curved, there will but few look at the would have how and business. If we look at the moisture.

Mr. Bead said if Mr. Bacon set his bees out at night, he would have no trouble in getting bees mixed.

Mr. Read said he had poor success in wintering bees. One winter he

of them show the three yellow bands, nearly all looking like two banded bees; but if we look at them again when from 5 to 10 days old, they will when from 5 to 10 days old, they will look like different bees, their abdomen having tilled out at that age. I claim every bee should show the three yellow bands while standing on the combs, to be such bees as I should want to breed from. Now pass to November, and again we have the same thing which we saw in our very young bees over again, at which time young bees over again, at which time the bees of our best colonies in their undisturbed repose, she more than the two bands. show scarcely

As far as my experience goes, I have yet to see the queen whose progeny show the three yellow bands under all circumstances. I quite agree with Mr. Demaree, that condition has a great deal to do with the working capacity of a colony, be they dark or light; still I also believe there is a difference in bees, and that only by a farm, som raiso believe there is a un-ference in bees, and that only by a careful selection of the best each year, can the "coming bee" be obtained. Borodino, N. Y.

### Preparing Bees for Winter.

The following discussion on this subject, had at the North Eastern Convention last February, will be of interest, now that it is time to be preparing for another winter. It followed the reading of Mr. Chas. Dadant's essay, as published in the BEE JOURNAL for Aug. 3, 1881, page 242:

Mr. Bacon said it was sometimes Mr. Bacon said it was sometimes impossible to put bees in winter quarters just after a flight. This season cold weather came on suddenly and remained. He advocated winter flights, although bees could be successfully wintered without. I find that bees get moldy in cellars, but they winter well in the bee house.

W. A. House concurred in these remarks: He had wintered in 5 different cellars. Lately he had experimented in out-door wintering. In the winter of 1879-80 he had 101 colonies, and kept 13 in the cellar, the rest beginned of the statement of the second se ing left out-doors. His percentage of losses was largest among the bees

osses was largest among the bees kept in the cellar.

Mr. Doolittle thought Mr. Dadant was mistaken in saying that bees would die in 48 hours at a temperawould die in 48 hours at a temperature under 40°. Bees would be dornant, but on being brought into warmth would revive. The effect of cold depended on the condition of the stomach of the bee, whether full or not. Mr. Dadaut met his views on the subject of water being necessary for the venus broad. for the young brood. Mr. Dadant says bees will die it kept longer than says bees will die if kept longer than 5 or 6 weeks without a flight. His bees had already been in ten weeks without a flight. He had once kept bees five months without flight. He did not think it necessary to put each hive on the same stand it occupied the year previously. He set out his bees promisenously and lost no bees. The bees marked the place from which they took their flight.

Mr. Bacon said he had given up

Mr. Bacon said he had given up marking the place where the hives stood. He believed in putting out only a few bees at a time. Putting them all out at once confused the

Mr. Rians said he had been very successful in wintering bees for five years. He wintered on the summer stands, putting a quilt over them and packing around with straw. This winter he put a coffee sack filled with chaff in the tops of the hives to ab-

covered the hives with snow, and wintered all but 1 colony out of 11.

Mr. Bacon believed wintering under snow was very good, provided there was no rain.

Mr. House said the moisture of the

Mr. House said the moisture of the unfrozen ground, had a bad effect on bees kept under snow.

Mr. Snow said he used a double-walled hive. He placed his bottom board on dry pine shavings to keep the wind from blowing under the hive.

This is just as invocating as a way. This is just as important as a warm floor in a house.

Mr. Read said he had found that bees wintered in the cellar, dwindled more in the spring than those kept out-doors. Mr. House coincided with

Mr. Snow said he had built a stone Mr. Show said he had buth a stone bee house, kept his bees in it one winter, and in the spring found that it took longer to stock them up than those left ont-doors. Since then he had adopted the plan of wintering on summer stands with much better results. Und practiced this altegrapher sults. Had practiced this altogether

for ten years with good results.

Dr. Marks gave his experience in wintering bees under snow. He instanced a case where there was heavy crust on the snow, where his bees kept best of all. Bees kept in-doors dwin-dled twice as much in the spring as

those wintered out-doors.

Mr. Doolittle said winters varied, therefore he thought it good policy to winter in the cellar, and out-of-doors in equal proportion. A winter favorable for wintering out-doors, was not favorable to wintering in the cellar. favorable to wintering in the cellar, and vice versa.

Mr. Bacon favored a higher temperature than 40° part of the time during

Mr. House said his experience was precisely like that of Mr. Doolittle in regard to wintering under the snow.

Mr. Doolittle said he had kept bees in a cave, distant from the outer air no less than 3 feet at any point. The no less than 3 feet at any point. The temperature of the interior did not vary more than 1 degree the entire winter. The bees wintered very well.

Mr. Nellis thought bees wintered nowhere better than under the snow.

Boss under the crow are very degrees.

Bees under the snow are very dormant and consume but little. He preferred to have the snow as deep as possible shoveled them out in the spring while the snow was dry. He favored Mr. Doolittle's plan of mixed wintering, that is partly in-doors and partly out-

Mr. Cyrenus said it made some dif-Aff. Cylends and it made some an terence whether bees were kept on the ground or a short distance from it. He believed in having just amound of bank. With a heavy bank, the hives are apt to become damp. He had practiced keeping bees under snow a

dozen years. Mr. Adsit said he had wintered bees in the cellar for 15 years with good success; never tried wintering out-

President L. C. Root said the best President L. C. Root said the best bee-keepers and writers differed from him on this subject. He had win-tered bees under from 1 to 15 feet of snow. He thought it important to have honey enough in the smallest number of comb. The matter of pre-paring for winter is the work of an entire season. Bees are from a warm climate and need an even temporar climate and need an even tempera-ture. The best bee-keepers employ artificial heat to keep their cellars warm. This is one of the best winwarm. This is one of the best win-ters we can have for wintering bees, and yet they will not winter well. We must have a place which we can warm if the outside air is too cold. He did not believe a purifying flight necessary. He had found that bees kept in till the 1st of May did the best. Those put out early dwindled. He was an earnest advocate of in-door earnest advocate of in-door was an earnest accorde of 11-400r wintering, believing that by this method bees were kept more nearly at an even temperature, and it was nearest to the natural condition of the

these with the best points of in-door wintering. He had cars made 7x6 feet, each car holding 36 colonies. He teet, each car holding 36 colonies. He placed the bees on the cars at his leisure in the fall. He used portable brood chambers. He left the old hives on the summer stands, but moved the brood chambers. Bees will not cling to the old hive, but will stay where the queen and honey are. His bee honey use first fact but house, but will stay where the queen and honey are. His bee house was 6x11 feet, with double 4-inch brick walls. There were 1 feet of earth on the roof. There were open spaces to let in fresh air. There were openings on the floor, connecting with the flues between the walls, having a chimney on each of the 4 walls. This kept the air within the building fresh. The paints region the great property was the series of the same of the first paints within the building fresh. The points gained were the saving of honey, which was a saving of bees. When the temperature allowed it in the winter, he opened the doors and rolled out the cars, rolling them back before night. This combined the good features of out-door wintering, puri-fying flights, with the benefits of indoor wintering. He found it impossible to keep bees quiet at a temperature above 36%. The height of inside walls was 7 feet. He bullt this house over a year ago.

Mr. Clark offered the following resolution, which was adopted:

"Resolved, That as bees are natives

of warm climates, that in wintering them in colder climates the requisites to do it successfully are a dark, quiet, and even temperature, and plenty of good sealed honey.

The time selected by the Executive Committee for holding the National Convention, at Lexington, Ky., is October 5, 6 and 7, 1881. All beebeepers are invited to attend and take part in the deliberations of the Convention. As Lexington is a central point, the Executive Committee hope to have a large attendance from the North, South, East and West, and from Canada, and that the 12th annual mention of the North Appariant Page meeting of the North American Bee-Keepers' Society will be the most interesting meeting that the bee-keepers of the United States have ever held. N. P. Allen, Pres.

The bee-keepers of Ontairo will Wednesday, and Thursday evenings, second week of the Industrial fair, 13th, 14th, 15 September, thus allowing those attending the convention to see the exhibition when it is at its best and also the convention, which promises to be of such importance that no bee-keeper can afford to miss it. Ladies are especially invited to attend. Notice as to place of meeting will be given in due time. D. A. Jones.

The Northwestern Bee-Keepers' Association will meet in Chicago, on Thesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. MILLER, M. D., Pres. States. C. C. MILLER, M. C. C. COFFINBERRY, Sec.

The Western Michigan Bee-\*\*E The Western Michigan Bee-Keepers' Association will meet in Berlin, Ottawa, Co., Mich., Thursday, Oct. 27, 1881, in Huntley's Hall, at 10:30 a.m. All interested, are cordially invited.

\*\*Wm. M. S. Dodge, Scc. Coopersville, Mich., Aug. 29, 1881.

😭 The Northern Michigan Bee-Keepers' Association will hold its fourth Annual Convention at Maple Rapids, Clinton Co., Mich., Oct. 11 and 12, 1881. O. R. GOODNO, Sec.

Bee-Keepers' Union.--The Eastern New York Bee-Keepers' Union Asso-ciation, will hold their eighth semi-annual Convention on Tuesday, Sept. 27, 1881, at 10 a. m., at Knowersville, N. Y. All bee-keepers are invited to attend. W. D. WRIGHT, Pres. N. D. WEST, Sec.

# SELECTIONS FROM

Over 100 Pounds per Colony. - Honey Over 100 Pounds per Colony.—Honey gathering in this part of the country, so far, has been good. My 68 colonies I had left in the spring out of 108 last fall, have averaged over 100 lbs., with a prospect of gathering considerable more. Can you tell me the cause of a queen's eggs not hatching? I have a give leading this queen's eggs not natching? I have a fine-looking queen that I reared this summer. It is over two months since she began to lay, but not a single egg has hatched yet. C. H. STONDOCK. Durand, Ill., Aug. 27, 1881.

[It is a strange case. The queen has probably been injured in some manner, which has caused sterility.—Ed.]

"The Coming Bee,"—Permit me through the JOURNAL, to offer an amendment to my original proposition, and that is as follows:
"Largest and longest worker bees,"

"Largest and longest worker bees." progeny of a queen reared by the exhibitor—this will exclude Apis Dorsata, or any other race of bees, not in reach of all. I do not know that I shall send any myself, but think now I shall. I can hardly expect to win the prize, and if I do not, I cheerfully pay the small sum of 25 cts. to know who has the best bees, that I may get of him. I have experimented a great deal in crossing, in breeding for length of tongue, size of bees, and gentleness, and find a marked difference in the different crosses. I am also satisfied that the mother of the bees that take the prize, will have bees that take the prize, will have been rocked in a horizontal cradle. send in my 25 cts.; act can rolling. I hope friend Briggs has received his champion queen, but neither \$10 nor \$25 would tempt me to unqueen my best colonies. Let all who wish for better colonies, send in 25 cts., and the sum will be large enough in the aggregate to find the "coming bee," and if fertilization in confinement can be accomplished, a good reward in cash will bring it about.

J. S. Tadlock.

Vingsbury, Texas, Aug. 23, 1881. send in my 25 cts.; let the ball keep rolling. I hope friend Briggs has re-

The Bee Journal worth \$10, a Year. —The Weekly BEE JOURNAL comes to hand with the regularity of clockwork, and fills the bill every time. I could not think of getting along without it, if it cost \$10, a year. Our bees are not gathering much buckwheat honey. What is the reason?

WM. CAIRNS.
Rockland, N. Y., Aug. 30, 1881.

Royal Jelly, etc.—In the BEE JOURNAL for Aug. 21, page 268, Mr. C. J. Robinson advances a theory that I do not understand. He writes: "1 claim, as set forth in a former article that queens are impregnated with royal jelly (drone's semen), while in the larval state." What I wish to learn is, how a nucleus colony composed of all young bees furnished with only of all young bees, furnished with only worker eggs to raise a queen, obtain this royal jelly to impregnate the queen in the larval state?

W. H. Stout.

Pine Grove, Pa., Aug. 29, 1881.

Drouth in Texas,—The great drouth still continues. The top of the ground is drier than at any time since 1864. It cannot well be described better than to say that everything is burnt up.

W. H. Andrews.
McKinney, Texas, Aug. 20, 1881.

Dry and Hot.—The early part of the Dry and Hot.—The early part of the season was good for bees, in this section. I started with 3 weak colonies, and bought 4 more. I now have 28 good colonies. I sowed buckwheat, but it was too dry and hot; it does not afford much honey, and unless it rains soon. I shall have to feed to get through the winter.

L. Armstrong.

Jerseyville, Ill.

Jerseyville, Ill.

Lychim Barbarum.—I send you an the parts of an ornamental shrub growing in my grounds; will you kindly give its name in the BEE JOURNAL, and how best propagated? It is a remarkable shrub for honey, my bees having been constantly busy on its propagation of theory for your points. succession of flowers for over 2 months. and are still so, when everything else the merit of being a very pretty hedge.

1. C. Tuorn, M. D.

Streetsville, Can., Aug. 17, 1881.

[The specimen sent is Lycium barbarum, or matrimony vine. It belongs to the order Solanacea, which includes the tomato, potato, nightshade, bittersweet, egg-plant, pepper, groundcherry, horse-nettle, etc. It is easily propagated by layering.—W. J. BEAL.]

The Nicest Honey for Years.—The bees almost all died in this locality last winter, but those that were left after the cold winds had passed, and the sun warmed the bees, began the sun warmed the bees, began to gather pollen, and increase in numbers and stores. I have 65 colonies now. They have done very nicely. I have the purest and whitest honey this season that I have had for the past 5 years. My honey is mostly in prize packages; have extracted but very little. The greatest question now is, how to winter them without loss. I shall be glad to receive the BEE JOURNAL in its new form next year, and I hope it may increase in interest in the future, as it has in the past.

in the future, as it has in the past.
Thos. Pierce.
Gansevoort, N. Y., Aug. 25, 1881.

A Terror.—This summer has been a terrible one for the bees of this. Province, for ever since the blooming of white clover to the present, continuous rains have fallen. My 12 colonies have hardly a pound of surplus honey in them at this date.

J. MATTHEW JONES.
Waterville, N. S., Aug. 25, 1881.

Melilot on Timbered Land.—Please tell us in the Bee Journal, whether melilot will do well if sown on timber land, if only the underbrush is cut out? Will the shade of the timber prevent it from yielding honey?

J. S. Hughes.

Mt. Zion. Ill., Aug. 26, 1881.

[We think it would be difficult to find shade dense enough to prevent its blooming and secretion of honey. It would be better, however, to harrow or brush in the seeds, as birds are very fond of them.—ED.]

Fwo Queens in One Hive.found 2 queens in a colony of bees; both are good laying queens, and both seem very peaceable in the hive. About the middle of June the bees prepared to swarm: they had 3 queen-cells, capped over: I waited, and looked in the hive every few days. One day I the hive every few days. One day I found that one queen-cell was already hatched, but I could not find the young queen. I then made up my mind to divide the colony, and took out one frame of bees containing the queen, and placed it in an empty hive with comb foundation, leaving it in place of the old hive, and put that in a new place, and by the next day. I had place of the old hive, and put that in a new place, and by the next day I had a pretty fair colony of bees with the old queen; but on that frame where the old queen was, I found no queencell. I left all the queen-cells with the young bees. About a week after dividing, I looked in the hive where the old queen was, and could not find her, and found they had a queen-cell started. I then thought the old queen was lost, or the bees had killed her; 3 weeks ago I found every frame—even the outside ones full of brood, all ready to batch, and no young eggs all ready to hatch, and no young eggs or larvæ; that drew my attention, and of looked for the queen, but found 2 queens—the old one which was in the colony when 1 divided it, also a new one, both on one frame, about 4 inches apart, and it seemed to me both were

Lycium Barbarum.—I send you all busy looking for empty cells. I have looked once every week since, and always find the 2 queens peaceably busy, with the difference that the old queen with the difference that the old queen creeps around pretty slow, while the young one is quite lively.

F. W. DITTMER.
Defiance, O., Ang. 25, 1881.

A Good Honey Plant.—Please name A tood noney Frant.—I lease name this plant; it commences blooming a little before basswood, and the bees prefer it to basswood; it yields honey as white as water, and pollen as blue as blue paint. I got about 100 pounds of honey per colony from this plant. The honey is very sweet, and has but little flavor; people say I make it of white sugar, and object to buy it. The white sugar, and object to any it. I he bees ceased to work on it about a week ago on account of bad weather, and brood-rearing stopped. Bees will rear no more brood now, as the last brood usually hatches here the first week in September. I would like the name of the object so it is to know, what to call september. I would like the faller of the plant so as to know what to call my honey. It would be excellent to cultivate for honey, as it will thrive anywhere, and the seeds fly all over the country. It grows between 3 and 5 feet high.

Only Min. Apr. 11 1881 5 feet high. WM. FRI Duluth, Minu., Aug. 14, 1881.

[Prof. Beal informs me that the plant is willow herb  $E_{pilobium}$  augustifolium. It is also known as gnat weed and fire weed, and is common throughout the North.—A. J. Cook.1

Eggs that Will Not Hatch, -I purchased an Italian queen of a breeder in Kentucky about a month ago; she was somewhat daubed when I received her, but I introduced her into a good. strong colony. In 5 or 6 days after I found the queen apparently all right, and laying in I sheet of comb; being busy. I did not look at her any more until yesterday, which was about 25 or 30 days from the time I had introduced her. As she was a warrented duced her. As she was a warranted queen, I thought I would look at her queen, I thought I would look at her worker progeny. I found the queen crawling over the combs as large as life, and appeared to be prolific, but to my great surprise there was no larvae in the hive, but plenty of eggs in the same sheet. The bees appeared to be perfectly satisfied with her, and did not build queen cells, as with a fertile worker or drone-laying queen. It is something new to me, what do you think about it? J. R. REEVE.

Martinsburg, Tex., Aug. 30, 1881.

[We can assign no positive cause for the phenomenon. You will find in this number a similar instance related by Mr. C. H. Stordock, of Durand, Ill.-ED.]

H. A. Burch Again.—This has been a good season for bees, here, up to about July 10, when dry weather set in. We have had no rain here from that time until to-day. We are having a fine rain now, and I hope we will have a good fall for honey. The drouth has been tolerably hard on us. but not so severe as it has been elsewhere. I have increased my bees from 5 colonies to 18 by natural and artificial means, and think they are in tolerably good condition. I am sorry that II. A. Burch has disappointed his customers so; I recommended him to some of my bee-keeping friends last spring. He now has their money and gave nothing in return. ISAAC SHART.

Waveland, Ind., Aug. 31, 1881.

Rolling in Honey.—We began the season with 30 colonies, and now have 72. We increase by dividing and always succeed: 1 colony gave us 5; 2 were artificial and 3 natural. We have 4 acres in buckwheat, and the bees are rolling in the honey. If the weather keeps good we shall have an immense yield. In queen rearing, we were successful. 1 notice, in other localities, some breeders were unsuccalities, some breeders were unsuccessful.

MOLLER & SON.
Fremont, Neb., Aug. 23, 1881.

Vennor's Predictions.—I think Vennor should have a leather medal, in place of frequent storms. We have a disastrous drouth; for frosts, 100° in the shade. There has not been rain enough here for 6 weeks to lay the dust fairly. Of fall honey we have about <sup>1</sup>4 a crop; basswood about the same, and white clover about 1/2 a crop. II. D. BURRELL. Bangor, Mich., Sept. 1, 1881.

My Report.—Early drouth made the clover crop less than 12 the average. Something unknown to me made the basswood the same. We are now in the middle of the fall harvest, and as it is 5 weeks and 2 days since we had any rain (we never knew such a severe drouth in this locality before), our fall yield will not be but \(\frac{1}{4}\) of an average crop. JAMES HEDDON.

Dowagiac, Mich., Aug. 29, 1881.

That Bogus Dunham Foundation. The apiarian supply dealers of Michigan (one of whom I have found to be gan (one of whom I have round to business transactions), wish me to give the name of the tirm from whom I purchased foundation, spoken of on page 29 of the American Bee Journal of ISSI. As by keeping the name from the public, they are all suffering loss of business, I cheerfully comply with their request. Messrs. H. A. Burch & Co., of South Haven, Mich., are the parties that supplied the bogus Dunham foundation.

J. B. HALL. Woodstock, Ont., Aug. 31, 1881.

"The Bridal Eve."—Mrs. E. D. E. N. Southworth's powerful and highly absorbing novel "The Bridal Eve" is shortly to be issued by Messrs. T. B. shortly to be issued by Messrs. T, B. Peterson & Brothers of Philadelphia, Peterson & Brothers of Philadelphia, Pa., in excellent style at the exceedingly low price of 75 cents a copy. This fascinating story deals with love, romance, crime, and woman's devotion, and has a plot of the most ingenious and effective description. The scene is laid in England, and the characters mostly move in high social circles. The cheapness of the work should give it an immense side. Everybody will be delighted with it.

The St. Joseph Democrat says that Missouri was the second State in the Union for the production of honey in 1870. The following shows the surin 1870. The following shows the surplus production of the counties named, in that year: Atchison, 10,608 lbs.; Andrew, 16,183; Buchanan, 7,626; Caldwell, 21,340; Carroll, 20,812; Clinton, 18,891; DeKalb, 10,627; Daviess, 25,052; Gentry, 23,480; Harrison, 46,924; Livingston, 17,331; Holt, 15,670; Nodaway, 15,335; Platte, 12,044; Worth, 17,000. in 1870.

The South Eastern Mich. Bee-Keepers' Association, will hold its 4th meeting at the Court House, in Ann Arbot. Wednesday, Oct. 5, 1881, at 9 o'clock a. in.; the week of the County Fair. An adjourned meeting may be held during the week. All interested are invited to attend. By order of the Executive Committee.

N. A. PRUDDEN Chairman

N. A. PRUDDEN, Chairman.

The North Eastern Wis. Bee-The North Eastern Wis. Beekeepers' Association, will hold its fall meeting at Peewaukee, Wis., on Tuesday and Wednesday, Oct. 11 and 12. A full attendance is cordially requested. Notice of the plance of meeting will be found at the local Post Office.

GEO. CHURCH, Pres., Neenah, Wis.

FRANCES DUNHAM, Sec., Depere, Wis.

The Eastern Michigan bee-keepers Association will hold its fall meeting in Detroit, Oct. 4, in the V. M. C. A. hall, at 10 o'clock a. m.
A. B. Weed. Sec.

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Wis., Nov. 30, 1881. N. E. France, Sec., Platteville, Wis.

#### SPECIAL NOTICES.

Single copies of the Journal sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week. .

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists —Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the old as well as the new address.

© Constitutions and By-Laws for local Associations \$2,00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Faded or Gray Hair gradually recovers its youthful color and lustre by the use of Parker's Hair Balsam, an elegant dressing, admired for its purity and rich perfume.

There is More Strength restoring power in a 50 cent bottle of Parker's Ginger Tonic than in a bushel of malt or a gallon of milk. As an appetizer, blood purifier and kidney corrector, there is nothing like it, and invalids find it a wonderful invigorant for mind and body. See other column.

A Sample t'opy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collection them. expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the Journal for a year free. It will pay to devote a few hours to the Bee Journal.

It would save us much trouble, it all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list. It would save us much trouble

Premiums,-Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums:

For a Club of 2,—a copy of "Bees and Honey,"

"4,—an Emerson Rinder for 1882,
4,—Cook's (Bee) Manual, paper,
cloth.
"5,—Weekly Bee Journal for i year.

**©** We have a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in ISS2 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied *free*, in any quantity they may be able to judiciously use.

### Notice to Vice Presidents.

Notice to Vice Presidents.

I desire to say to the Vice Presidents of the North American Bee-Keepers' Society, that I wish each one would send me a report of bees and honey in their respective states, as it is customary for the Vice Presidents to make such reports at the annual meeting of our Society. I hope that none of them will fail to do so. I would be glad to meet them at the Convention, and become personally acquainted with them. Programmes will be sent to them for distribution to the bee-keepers of their States.

Entered at Chicago post office as second class matter.

### The Foreign Demand for Honey.

On page 236 of our issue for July 27, we assumed that " Honey is Becoming a Staple," and adduced in proof of our assumption the statistics of the rapid increase in importations and sales of American honey in Germany within the past four years. We now have further confirmation in the following letter from Mr. W. M. Hoge, who is connected with one of the large jobbing houses in London:

If you know of a honey producer who wants to market his crop in England, consign him to us, if his honey is strictly white comb, and stored in nice boxes. I have an outlet for 50,000 pounds. We can market that quantity, and the producer can take the proceeds back in a month from the time he lands. But he must load it on the steamer *himself*, and unload it. There is no danger whatever of the honey-combs in transit—the danger lies in the loading and unloading.

London, England, Aug. 25, 1881.

We now feel assured that with a ready and anxious market for our comb honey in England, and France, Germany, China and Japan as eager consumers of American extracted honey, all fears of over-stocking the market are happily set at rest, and the time is not far distant when prices will be as quotable, and as generally uniform as for any other product. Nor need we fear a divided market by reason of foreign competition, for no country in and fifteen gallon kegs, is quite as de-

for honey producing as is the United States, and none produces honey of finer quality.

Time was when prejudice militated greatly against our sales abroad, but the cultivation of fraternal relations with our friends in foreign lands, and the assurance of friendly feelings and honorable transactions, have turned their honest prejudice into esteem, and their jealousy into generous cooperation.

With the assurance of a ready sale for every surplus pound of honey, it now devolves upon our producers, as individuals and in their conventional bodies, to deliberate upon the best methods of meeting this demand. Much depends upon them.

### Centralizing the Honey Traffic.

After a careful perusal of the able article on page 292, in this number, by Mr. G. W. House, we can heartily commend it to our readers for their best thoughts. Bee-keepers should, as far as practicable, be thoroughly informed in the statistical department of their pursuit, so that each may not only know how much he has produced and what it has cost him, but also how much has been produced in the whole country, and its value. To this end. all should furnish detailed reports for publication.

We cannot agree with Mr. House in the desirability of centralizing the honey traffic in the hands of two or three, or even more, dealers in each of the principal markets. Several years ago this might have been advisable while the trade was in an undeveloped state, when honey was shipped to market with no reference to grade, that in the comb being packed in tubs, jars. pans, soap boxes, etc., and the extracted in large, hardwood barrels, or whatever else came handiest. No commission merchant, with an established trade, cared to handle it: and if perchance a shipment was consigned to him, it generally proved a nuisance in the store, and was sold to the first bidder, at any price offered, to get it out of the way and to abate the leaky nuisance.

Now, however, a wonderful transformation is taking place. Any respectable commission man will be glad to handle the popular one and twopound sections, properly crated and glassed, and certainly extracted honey in the neat and attractive five, ten Europe is so greatly favored by nature | sirable to handle as butter, cheese and | cess.

eggs. Besides, with the custom now universally coming in vogue with the more practical apiarists, of grading and keeping separate each kind of honey, no long experience or especial familiarity with the article on the part of the commission merchant or jobber is required; but, rather, an extensive business acquaintance, a well established general jobbing trade, and an unimpeachable reputation for honesty and veracity.

Again, the proposed centralization or co-operation is impracticable, for the reason that the necessities of beekeepers vary as much as do their ideas regarding hives, wintering, etc. As a rule, the heavier producers have their outlets to market already established, or have had sufficient experience to be able to sell in job lots to the best advantage; these men, of course, would see no advantage to be derived from co-operation, and would not jeopardize their established trade by entering into the scheme. On the other hand, the lesser producers, and those "new at the business," as a rule, want to realize immediately, and more frequently accompany their honey to market, or by correspondence and through samples forwarded, sell it outright; this class would gain nothing, because, being generally inexperienced, their product would grade lower, and their returns would be correspondingly unsatisfactory, unless "worked in" with some better grade, in which case an imposition is practiced on the buyer.

The honey interest of America is of too great magnitude and the producers too numerous, to make successful any attempt to centralize the trade in the hands of a score or less of middlemen. We cannot, however, commend the indiscriminate slaughter of prices by intrusting the sale of honey, or anything else, to irresponsible or unprincipled agents. With a little prudence and painstaking on the part of the producer, enough honorable, competent and willing men can be found in each city to bandle to advantage every pound of desirable honey which may be forwarded to it for a market.

St. Joseph, Mo., Exposition .- The editor has just returned from his visit to the St. Joseph, Mo., Exposition. We will give an extended report in our next issue. We cannot refrain from saying, however, that through the energy and excellent management of Mr. R. S. Musser, the apicultural department was a most complete suc-

### The Honey Harvest.

The great question now is: "What will the harvest be?" Mr. W. D. Wright, of Knowersville, N. Y., on a postal card writes us: "Why do you not call for universal reports of the honey crop this season, as you did last year?" We reply: For the simple reason that we want to get them all in within a few days, so as to publish all at one time, and it was too early to get a correct report. Several others have expressed a desire to have a statistical table, and we shall, therefore, ask all to send us, on Sept. 26th, a short, concise report on a postal card. If ALL will follow the form given below it will aid us in making up the figures:

I had.....colonies in spring; honey, and.....pounds dark honey; comb honey...... .bounds. Bees are now in......condition.

Sign your NAME, POST OFFICE, COUNTY and STATE, and mail it to us promptly on Sept. 26th. If delayed till after the 26th, it will be of little interest to the public, and no practical use to us

If promptly furnished, this Report will benefit every producer of honey who desires to place his crop upon the market, and while it need not cost more than one cent for each (the cost of the postal card), it will be of immense benefit to the honey interests of the whole country. Let every one give this prompt attention.

Apis Americana.—On page 291, the Rev. W. F. Clarke remarks as follows: "The editor of the AMERICAN BEE JOURNAL has proclaimed Apis Americana the coming bee. But, Mr. Newman, 'bide a wee,' possibly Apis Canadensis will win the laurels," Even then, Mr. Clarke, we are right; unless Canada is not a part of America! We care not whether it is produced in one of the "States," Provinces, or countries on the American Continent; but, when "the coming bee" is produced, its name will be Apis Americana! Let that be distinctly understood in advance.

We have received the price list of poultry and nursery stock for the fall of 1881, issued by Thos. J. Ward. St. Marvs, Ind.

We are pleased to learn that Mr. J. T. Wilson has recovered from his late injuries, which we mentioned last week, and is attending to business.

For the American Bee Journal,

### Origin of Drones-Parthenogenesis.

DR. WM. R. HOWARD.

Mr. C. J. Robinson, in the Ameri-CAN BEE JOURNAL of March 23 and  ${f Aug}, 24$ , has made some deductions on new drone theory. He denies parthenogenesis as being a fact in ture, and considers it a hypothetical doctrine, etc. Let us fully under-stand the subject under consideration, and then see how far Mr. R. goes with us. First, let us see what can be proven in regard to parthenogenesis. and secondly, apply it to his drone theory. Let us take up first for consideration, bisexual animals, examine them, and compare them with com-

menening at the egg.

According to Prof. H. J. Clark (Mind in Nature), an egg is a globule surrounded by the vitelline membrane, or yolk envelope, which is protected by the chorion, or egg shell consisting of two kinds of fluid, albumen and oil, which are always situa-

then and on, which are anways situated at opposite sides or poles.

"In the earliest stages of all eggs, these two poles shade off into each other," but in the perfectly developed egg, the small, or albuminous pole, is surrounded by a possible of the small of the s surrounded by a membrane, and forms surrounded by a hembrane, and forms the Purkinjean (germinal) vesicle; and thirdly, and last, the innermost of the three globules is developed This last is the Wagnerian vesicle, or germinal dot. The oily matter forms the yolk. Thus formed, the egg is the the yolk. Thus formed, the egg is the initial animal. It becomes an egg af-ter contact with the male germs (unless the product of organic reproduc-tion), and the egg-shell, or chorion, is to be considered as a protection to the animal, and is thrown off when the embryo is hatched, just as the lar va throws off its skin to transform into a pupa. So that the egg state is equivalent to the larva state, and to the larva state, and hence there are 4 stages in the life of an insect—the egg, the larva, the pupa, and the imago or perfect insect. On the anterior end (though some-

times at both ends of the egg), is one or more pores, or micropyles, of ex-ceeding minuteness, through which the spermatozoa (more than one of the spermatozoa (more than one of which, according to Darwin, is requi-site to fertilize an ovule), enter to re-tilize the egg contents. In some cases these micropyles are scattered over the whole surface of the egg. This contact of a male sperm-cell with the yolk is the fertilization of the egg. From this moment begins the life of the embryo.

the embryo.

Fertinzation of the female germ by means of the male sperm, through the congress of the sexes, is the rule with congress of the sexes, is the rme with bisexual animals, but there are ex-ceptions among insects. An embryo-may start into being without the in-terposition of the male; to this mode deposition of the finite, to this mone of generation, has been applied by Leuckart, the term parthenogenesis.

Packard says: "Among certain species of insects, there are some insects."

dividuals which, by a sort of budding process, and without the aid of the male element, throw off summer broods, consisting of "asexual" individuals, which, as winter approaches, are succeeded by a brood of true males and females, the latter of which lay

This phenomenon, called by Steenstrup "alternation of generations, has been observed among a compara-tively few species. The individuals tively few species. The individuals in whom this budding process takes place are called "asexnal," because, though they may resemble the female sex outwardly, their sexual organs are only partially developed. This budonly partially developed. This budding is the same in kind with that observable in the jelly-lish, which throw off by parthenogenesis or alternations of generations, summer broads of immense extent, but in winter proving to by this eags. propagate by true eggs.

Huxley has studied the development of aphis by parthenogenesis, queen, we consider it unimportant the anomalous nature of which had and even unnecessary, and lacking previously been discovered by Bonnet, Trembly, Lyonet, Degeer, Kyber und others, and arrives at the following conclusions:

1. Ova deposited by impregnated

female aphides in autumn, are hatched

in the spring.

From these ova viviparous, and, in a great majority of cases, apterous forms proceed.

3. The broods to which these give

rise are either winged or apterous, or

both.
4. The number of successive broods has no certain limit, but is, so far as we know at present, controlled only temperature and the supply of

The males may be either winged or apterons.

So far as I am aware, there is no proof of the existence of any exception to the law that the oviparous female is apterous.

Viviparous aphides may hybernate, and co-exist with oviparous fe-males of the same species — (Linnæan Transactions, xxii. page 198).

The origin of the viviparous, asexor agamic (from the Greek a. without; game, marriage) individual, as it may be more properly called, is up to a certain stage the same as that of the true egg. i. e., until the germ (pseudovum) of the former is detached from the false ovary (pseudovarian). varium). "From this point onwards, however, the fate of pseudovum is difterent from that of the ovum. The tormer begins at once to be converted into the germ; the latter accumulates yolk substance, and changes but litde. Both bodies acquire their membranous investment rather late; within it the pseudovum becomes a living larva, while the ovum is impreg larva, while the ovum is impreg-nated, laid, and remains in a state of st for a longer or shorter period Huxley

Siebold has also shown that the ova of the queen-bee produces females or males, according as they are fecundated or not. The feeundated ovum produces a queen or neuter (worker), according to the food of the larva, and the other conditions to which it is subjected; the unfecundated ovum produces a drone. This is analogous to the agamic reproduction of aphis, and demonstrates still more clearly the impossibility of drawing any absoline of demarcation, Instologically between ova and buds

This method of reproduction occurs among mites, isolated genera of hemiptera, and also several species of lep-idoptera have been known to lay ferdoptera have been knewn to my ter-tile eggs without previous sexual mion. And the late and lamented Benjamin D. Walsh, of Illinois, ob-served a species of hymenopterous gall-fly to lay fertile eggs without pre-

vious sexual union.

Nicholas Wagner, and also Dr.
Leuckart have observed an asexual Leuekart have observed an asexual reproduction in the larvæ of certain

Parthenogenesis or agamic repro-"Parthenogenesis or against reproduction, is then," says Packard, "the result of a budding process, or cell growth. Metamorphosis is simply a series of marked stages, or periods of the stages of marked stages. growth; and hence growth, metamorphosis and agamic reproduction, are phosis and againte reproduction, and morphologically identical. All ani-mals, therefore, as well as plants, grow by the multiplication of cells.

We have given abundant proof of the fact that agamic, or asexual, individuals occur in several natural or-ders of insects, and might cite the reader to cases where experiments carried on in a practical and satisfae tory manner, proved beyond a doubt that parthenogenesis was an estab-lished fact in nature, but we deem it

to give the proper elements of the queen, we consider it unimportant proof; also the manner of producing tertile workers, that is, "fecundating" the "ovary" of the worker through the digestive organs, etc., not only absurd, but contrary to any other rules or laws of physiology. His method of hybridizing—he says, "It is ascertained that the embryo drone ers and queen, can each be hybridized in the ovary, egg, or larva state, which is communicated to the whole production. I think the evidence con-clusive in the reproduction of the aneen.

Here we again are compelled to differ with our Irlend, and call for the evidence.

by temperature and the supply of tood.

5. On the setting in of cold weather, or in some cases on the failure of nourishment, the weather being still warm, males and oviparous females are produced.

6. On the setting in of cold weather, or in some cases on the failure of the hallenges Prof. Cook to produce one intelligent apiarist, not barring himself, to explain and prove, beyond a doubt, that drones originate by particular particular policy. thenogenesis.

Now, since parthenogenesis, or a game reproduction is the production of living individuals, without the acof hying individuals, without the actual congress of the sexes, he is compelled to admit the production of drones by parthenogenesis. In conclusion we will quote: "No intelligent scientist will confess that he, in mataches the control of the second of th ters pertaining to any science, pins his faith upon some one, or some few observations of his own, and say that others are non-intelligent who are not of the same faith." If Mr. R. is not like Ephraim of old, "joined to the idols," he will have to give in.

Kingston, "Payes."

Kingston, Texas.

For the American Bee Journal. A Visit to Mr. Jones' Bee Islands.

WM. F. CLARKE.

To save needless encroachment on the crowded and valuable space of the American Bers Journal, let me ask readers of this article to look at a map of Canada, and note the geography of the Georgian Bay, almost a duplicate of Lake Huron, and lying eastward of that vast body of fresh

The port of Collingwood should be marked on the map, but if not, let it be observed that it lies at the southobserved that to hes at the south-erly point of the bay. It is 40 miles from Beeton where Mr. Jones carries on his home apiaries. The Hamilton & North Western R. R. connects Bee-ton and Collingwood. There is a steamboat communication between Collingwood and Parry Sound, 76 miles to the north, during the season of open navigation. Parry Sound is an important lumbering point, and the centre of a new and rising agri-cultural district. The route between Collingwood and Parry Sound is throughan archipelago of islands, varying in size from a dining-table to several miles in extent. These Is-lands are unsurveyed and unsettled. Very few of them are of any agricul-tural value.

Mr. Jones has pre-empted 3 of them,

and established a great national and continental queen-bee breeding estab-lishment on them. They are called respectively, Palestine. Cyprus, and Italy Island. There are no wild or domesticated bees in all this region, except those transported energy set. Jones, for the good and sufficient reason that there is not a flora sufficient to sustain a colony of bees. Hence it except those transported there by Mr. son that there is not a joint to sustain a colony of bees. Hence it is the beau ideal of a queen-breeding locality. The 3 islands chosen by Mr. locality. The 3 islands chosen by Mr. Jones are 6 to 8 miles apart, so that intermixture of the races is impossible, unless done on purpose.

### THE MODUS OPERANDI.

Palestine Island, 16 miles from Parry Sound, is the headquarters of this business. The steamers pass close to a point of this island, which makes it convenient for shipment. On each of the islands there is a little with a steamer of make it.

young queens are cut out just as they are about to gnaw themselves free from the cells. As soon as they are fairly hatched, they are put into Peet rainy natched, they are put into Peet cages with some companion bees, and shipped to Palestine Island. A num-ber are sent in full colonies, needed to replenish the nuclei, and a small proportion are raised on the island. These last are exceptionably good, owing to constant feeding of the large colonies, which are kept at swarming point, but prevented from swarming by constant removal of queens. soon as the young queens are mated, and commence laying, they are re-caged, sent back to Beeton, usually again introduced to colonics, and allowed to lay until shipped; bence they generally go through 2 probations as to laying. As to the extent of the operations carried on, there are about 122 nuclei on Palestine Island, about 75 on Cyprus Island, and 50 or 60 on Italy Island.

MAGNITUDE OF THIS UNDERTAKING.

I had no idea until I visited these islands, how formidable an affair the enterprise was. About 200 full colonies of bees have been sent here, thus far the present summer, and it will take another 100 before the season is over. All experienced bee-keepers know what a great mortality there is among bees, and how short-lived they are during the busy part of the year. To the ordinary causes for this, there must be added here, the prevalence of high winds, and the proximity of water. Whirls of wind carry the bees into the water, and the losses from a variety of sources are so great, that sometimes, nuclei have to be renewed every 2 or 3 days. Quite a percentage of queens are also lost.
This fact raises the question whether

they do not lower themselves to the ground in the act of mating, and amid the whirl of excitement, find them-selves in the aqueous element, before they are aware of it. Five men are constantly en. ployed in carrying on this business. One skilled bee-keeper can tend the nuclei and colonies on all 3 islands, but he must be waited on by islands, but he must be warten on by an expert sailor, capable of making voyages to the islands, whether the wind be high or low, fair or foul. A sailing yacht is run when there is wind, and a row-boat used when it is calm.

These are stormy waters; a squall is liable to arise at any time; one struck us when yaching to Italy Island, which came within an acc of capsizing us, and only an experienced navigator could manage this part of the work.

At Beeton, I man does nothing but At beeton, 1 man tows norming one raise queens; 2 others are busily enough employed making cages, and nuclei packing and shipping. Every trip to the islands and back costs \$6, nuclei packing and shipping. Everip to the islands and back costs trip to the islands and back costs \$6, and the daily expressage amounts to a considerable sum. The bees on the islands gather but very little, and it takes no small amount of honey and syrup to feed them. Bees don't work for nothing and board themselves on these Islands," by a jug full," rather, by a great many barrels full.

The miscellaneous expenses for ma-

terial and supplies foot up a large bill.

### DOES IT PAY?

Not in money at present. I am well convinced that Mr. Jones could have made more profit by keeping these 300 colonies of bees at his home apiary, and running them for honey and increase. But this thing is only in its infancy, as yet. Its importance will grow in the estimation of all intelligent bee-keepers.

We talk about tested queens. it is all moonshine; as well talk of tested mares, cows, or ewes. All good stock-breeders know that we must have pedigree as well as points. There must be some guarantee of purity as to breeding. I have seen the first cross of highly pre-potent males, that that parthenogenesis was an established fact in nature, but we deem it amnecessary.

In Mr. R's theory of queen-producing, i. e., workers impregnating the larva with drone semen, etc., in order long run, we must have somewhere, a fountain of purity. We have got it in Jones' islands, and nowhere else at present. Probably other similar establishments will be started, but it will take money and pluck to do it.

I predict that the price of absolutely

I predict that the price of absolutely pure queens will rise in the market, instead of falling. It will be as with short-horus among cattle; notwith-standing the multiplication of this breed of eattle, pure-breed specimens from choice families were never so high in the market as they are to day. It will be so with absolutely pure-bred bees. Unless we discover how to mate queens in confinement (which 1 for one am not sanguine about), our colonies will deteriorate, and we shall

colonies will deteriorate, and we shall have to breed up from time to time, from a source of infallible purity.

I think I detect a little weakening in Mr. Jones. He says he would not go on with this thing but for the determination to have the very best stock in his own apiary. Every other advanced bee-keeper will form the same resolve. We cannot afford to let Mr. Jones get discouraged; at any rate, not, until somebody else is prerate, not until somebody else is pre-pared to take his place.

From a careful inspection, both of his breeding and home stock, I think he has got it to a high pitch of excel-lence. He must be patted on the back and cheered onward. We cannot at-

ford to recede.

If I were Mr. Jones, I should be willing, for a time, to take some of my pay in the honor of the thing. He is playing a lone hand which must is piaying a lone hand which most win, and there is a card up his sleeve called Apis dorsata, that is pretty certain to be a strong one when he gets it into the game, which he is determined to do, regardless of cost. Every true apiarist will say, "Success to him!"

#### THE COMING BEE.

It is too soon to predict what this will be. We shall probably get it by judicious crossing. The short-horn, which now leads the cattle tribes, was obtained by a series of crosses and breeding for points, till valuable char-

breeding for points, till valuable characteristics got fixed.

We shall develop the bee of the future in the same way. There will be careful comparison, and the "survival of the fittest," until we reach the acme. At present, the Holy Land bees and their crosses are without doubt, the regal race. For proliticacy, hardiness, industry, gentleness they are A 1. There are strains of Italians that are not far in the rear, and are well worthy of perpetuation. I am not enumored of the Cyprians, whatever their other good qualities may be; their temper is manniable.

whatever their other good qualities may be; their temper is unamiable.

I had the pleasure of seeing a Cyprian colony make Mr. Jones beat a hasty retreat. It was a pleasure, because he redicules my veil, which enables one to stand their ground, while he was forced to flee. We do not yet know what hybridization will present by the control of the cont not yet know what hybridization will accomplish, nor has Apis dorsata yet appeared on the scene. The editor of the American Bee Journal has proclaimed Apis Americana the coming bee. But, Mr. Newman, "bide a wee." Possibly, Apis Canadensis will win the laurels! I will even forgive length of dagger, if Apis dorsata will bring us length of ligula. The coming the property of the house groups. bring us length of ligula. The com-ing bee must gather the honey crop of the red clover for us. Then, how we shall revel in liquid sweetness!

### MISCELLANEOUS REMARKS.

Any one who goes through these breeding apiaries as I have done, will not fail to perceive points of distinction among the 3 great races, now before the apicultural world. I am inclined to think the Palestine race the bee primeval, and I subscribe to Mr. Jones eloquent outburst, which I suspect he was rehearing for the next

convention, somewhat on this wise:

Behold, the bee which the Lord
God made when he created the heavens and the earth: the bee that stored honey in the carcass of Sampson's lion; the bee that made Canaan a land

which nearly cost Jonathan his life; the bee that buzzed around King David; the bee that fed John the Baptist; the bee that furnished honey comb for the risen Saviour's meal, be-

side the sea of Tiberias," etc.

My visit to the islands has impressed with the importance of raising high-class drones. I never saw such handsome fellows, as were many of those delegated to perform hymeneal service at this breeding establish-

Mr. Jones, in a quiet way, is paying a large amount of attention to drone-rearing, and I think he is right. In breeding other stock, the importance of securing the best males is fully recognized. I doubt not we shall find that the same law holds good in apiculture.

Finally, there are several points connected with the work that is going on at these islands, which may engage the best thoughts of the sembled wisdom at the approaching annual meeting of the North Ameri-

can Bee Keepers' Association.

I only wish that every member only wish that every member could visit these islands in advance of the meeting. That being impossible, I hope this narration may do some-thing toward producing the impression, that a most important enter-prise is in progress, which we shall do well to promote in every practicable and reasonable way.

Listowel, Ont.

### September Work in the Apiary.

C. H. LAKE.

If no surplus honey is stored in the If no surplus honey is stored in the boxes early this month, remove them and put on the honey boards, mats. or top covering to frames. Usually the honey flow is great in many localities during this and part of next month, and oft-times the unlinished sections and combs in the super-boxes will be readily filled up with honey from the fall flowers. In such locality is such locality in the super-boxes will be readily flowers. from the fall flowers. In such locations it is advisable to leave at least one box in position, to be looked at occasionally, and if occupied by the bees and the appearance of newly gathered honey, increase their storing capacity by adding one or more boxes containing the unfinished combs as they will be occupied, while new foun dation or empty frames will scarcely be looked at by the bees.

Drouths prevail in many localities.

and the bees show no disposition to visit the fields in search of nectar. Feed sparingly in such localities, and regularily every night, and keep the entrances of all weak colonies con tracted that no robbing may take place. Look through every hive care fully and know their exact condition by the middle of the month. If not at least 20 lbs, of honey sealed in the combs, feed during the latter days to the required amount; 25 pounds to a prosperous colony is all that is re-quired in ordinary winters. No queen-less colonies should be kept beyond this month in any case, unless where fertile queens are expected to be introduced. As queens are usually cheap at this season, it is a good time to re-queen. Young laying queens introduced during this month will, if propagity menaged, build up calonies. properly managed, build up colonies, strong in young bees, to go into winter quarters.

Keep no old queens; a young, vigorons queen will build up much faster for winter than queens known to be over 3 and 4 years of age. Equalize by taking brood from the extra strong and giving to the weak; but be careful and give the weak no more than they can cover and raise, or they will perish, and you will be at a loss.

Great care is required in building up small colonies to winter. To unite small colonies, smoke them well; then sprinkle thoroughly with sweetened water, scented with peppermint, unise or bergamot; shake the bees alto-gether into an empty box. Take the gether into an empty box. flow; the bee that made Canaan a land flowing with milk and honey; the bee that gathered the tempting sweet, hive. Pour out the bees before the

newly prepared hive; sprinkle again; when all are in, set the hive about equal distance between where the two hives formerly stood.

It is the safest to cage the queen for 21 hours, as the strange bees might at are hours, as the strange bees highten tack her; but after they miss their own, they will readily take to and pro-tect their "stranger mother." Make all preparations this mouth for the winter; prepare your top packing, mats, quilts, cob boxes, chaff cush-ions, or whatever you have decided to use, and have all in readiness for the

time coming.

Remember the essentials of success ful wintering is doing early what should be done, and then perfect quiet. From the sad lesson of the past win-ter many have "determined not to be caught that way again." See to it early, then, or a like experience may be the result.

Attend the fairs and examine the

bee departments; and contribute to the same, thereby encouraging and stimulating this branch of industry. Much valuable information can be ob-Manch valuable intormation can be obtained by a close inspection of the various contributions. Attend all the conventions, when convenient, and get up "Bee Keepers Clubs," if possible, in every neighborhood, where but even a few are engaged in the convenient and purple information, will pursuit, and much information will be gathered from this source, during the many winter evenings pleasantly spent in discussions.

Subscribe for the bee periodicals, if you are not already a subscriber, and read carefully the various reports of our most successful bee-keepers. Protheir experience in wintering and the general management, and your success will be sure to follow. But go into winter quarters with only strong colonies, with vigorous queens.

"Keen all colonies strong,"-Langstroth.

Baltimore, Md.

Bee Keepers' Guide.

### Co-operation Necessary.

GEORGE W. HOUSE.

As compared with other branches of As compared with other braineres of industry, Apiculture has been sadly neglected, as far as the marketing of our products is concerned. It is true that much progress has been made during the past few years in putting our products upon the markets in the most desirable shape, and that too, so is to attract attention and tempt the consumer to purchase, until at present American honey is finding its way on the tables of many thousands on the tables of many thousands of families, where until recently its util-ity and value was wholly unknown. Thus we are keeping pace with the times and other kindred parsuits. Our various publications devoted to anigulture, have been the mediums

apiculture, have been the mediums and beneficial factors in bringing this about, and to their editors. American apiarists owe a vote of thanks, it

nothing more

Now that all this has been accomplished, it is our duty to put forth our energies in other directions, viz: "Securing accurate statistical reports," and "The concentration of our products on the various markets." To accomplish this, will require much diligent and earnest work. We must have the aid of all our periodicals and issociations throughout the country In fact each and every one should work understandingly and co-opera-

Co-operation, and a unity of action are the monstrous mainsprings of power and progress. Associated effort is destined to revolutionize the business operations of the world. Is there one who has failed to notice the wonderful results that have been ac-

wonderful results that have been accomplished by associated action, and a combination of interests.

Think of the astounding results that have been accomplished by the associated system of dairymen. What cohave been accomplished by the asso-ciated system of dairymen. What co-operation has done for dairying and other branches of agriculture, it may also accomplish for apiculture. But there must be a commencement. Then let us all apply ourselves dili-

gently to the task before us. until we have placed apicultural products on an equal, or a higher footing (as com-pared with other branches of indus try), and unfurl our banner.

But it is important to consider the barriers to be surmounted, before success can be achieved. In the past, many bee-keepers have been in the practice of sending their honey to hundreds of commission houses in our large markets. A great many times consignments find their way into the consignments find their way into the hands of firms making specialties of butter and cheese, potatoes, and grain or flour and feed, and in nearly every such case you will find that honey piled up outside the door, begging for sale; and why? Because they have never handled honey; they do not know its market value, and they do not want it sitting around where it not want it sitting around where it will surely get broken by the carmen that are wheeling in and out such vast quantities of produce. Now what are the results from this state of things? The firm not having the facilities for or they will quote it as nominal. A buyer comes along, and about the folowing conversation will take place:
"Wish to buy?"

Buyer: "Perhaps, if prices suit." Commission Merchant: "What is it worth to you? Make me an offer."

The offer is made and the honey sold at the buyer's own price. The firm take their commission, etc., and the sacrifice is made at the producer's

All this is wrong; such transactions are the causes for the depression in our large markets, which work ruin and disastrous results to the producer, while he himself is the one at fault. The buyer passing along the street in our large city is amazed at the large our large city is amazed at the large offerings in honey. He thinks there is a heavy yield in the country, and the markets are being glutted with a flood of honey. While if the same amount of honey was confined to 2 or 3 good business houses making a specialty of our products, the buyer would be making inquiries for honey, and not afraid to buy at good fair prices, business the offerings would not be so not afraid to buy at good fair prices, because the offerings would not be so tree, thus having a tendency of depressing the markets. Furthermore, when we can concentrate our honey, we shall be able to sell for eash, and we shall see buyers traveling the country to purchase it, as they do now with butter, choose and other products. butter, cheese, and other products. The buyer would feel safe in pur-The buyer would feel safe in purchasing, because he would be confident that our products would not be scattered among the many various commission houses, who could cut the prices at the producer's expense. The apiarist too, could place more confidence in the business, because our products would have a fixed cash value, fluctuating in price but little, if any, and always in accordance with if any, and always in accordance wit the supply and demand as with all other kinds of produce.

In perfecting concentration, we must instruct, and look after the unexperienced, and those making the business a side issue. To accomplish this successfully, we must have the aid of our cessinny, we must have the aid of our various publications. I trust we shall soon see our weekly (the AMERICAN BEE JOURNAL), and our monthlies (the Guide, Instructor, Gleanings, and Magazine), all enlisted in surmounting this great translating block. ing this great stumbling block.

The importance of this question

cannot be too strongly urged, or imprinted on the minds of every bee-

keeper.
After a careful investigation, should select 2 or 3 of the most reliable firms in each of our large markets. Our journals should advise their read-Our journals should advise their readers of the selection made, and then let us one and all stand by the text. I would suggest for New York, the names of Thurbers & Co., and D. W. Quinby. For Chicago, A. H. Newman, R. A. Burnett, and W. F. Comner. For Cinciunati, C. F. Muth. If any bee-keeper knows of better firms, he should make it known. Bee-keepers that are posted in relation to other ers that are posted in relation to other

large markets, would do well to give us the desired information.

Another important factor to accomplish success, is, accurate and reliable pass success, is, accurate and renadic statistical reports regarding the yield of both comb and extracted honey from all the States, in time for Sep-tember journals, at the latest. In this, a weekly journal can be of much value, as we might obtain the desired information in the passes in information in many instances, in time to accept or refuse an open offer.

At the coming Convention of our North American Society, I trust they will take this question into consider-ation, discuss it thoroughly, and take immediate action on the conclusions arrived at. I know of but one way to accomplish the desired object, and that is through our National Society. that is through our National Society. The President should appoint energetic Vice Presidents for every State. They in turn shall demand of each and every Secretary of the different Associations within his State, to collect the correct reports of the yield within his territory; to report the same to the Vice President, who shall report to the Secretary of the National Association, and he be required to cause the same to be published in all the journals, no later than Sept. 1. There should also be a unity There should also be a unity Sept. 1. There should also be a unity of action in all our State and local Associations. They should instruct their members to report to their Secretaries, promptly and accurately. We must have co-operation if we wish to promote and protect our interests, and compete with other branches of industry. industry

Fayetteville, N. Y. Aug. 20, 1881.

For the American Bee Journal.

### Rocky Mountain Bee Plant-Cleome.

T. J. DODDS.

Dr. Keene, in the BEE JOURNAL for August, asks for information as to the best plan of raising this plant. Your note in answer thereto is good, but not note in answer thereto is good, but not correct. Here, in the streets of Le-Claire. Scott county, lowa, the plant is growing in all its splendor, and has been for several years past. In quantity and area of occupation it is rapidly on the increase, and in appearance it is indeed beautiful and pleasing to the eye. Its advent here was in this wise:

A returned presspector from Montane A returned prospector from Montana, some 12 years ago, brought a few seeds and presented them to our now worthy Mayor, R. A. Edwards, as the seed of a beautiful flowering shrub. These were planted and carefully nursed until the second state of the second seco were planted and carefully nursed until the second season, when they blossomed beautifully, but their peculiarly offensive odor made them objectionable, and they were plucked up and thrown into the streets. But like Banquo's Ghost, they "would not down." The seeds, carried by the winds and wash of the streets in all directions, took root and prospered, and to-day the sides of our not-much traveled streets are adorned with the traveled streets are adorned with the bee plant in luxuriant and abundant growth—a great improvement on tennel, jimson and ragweed.

All that Dr. Keene says about it as to its honey-producing qualities is correct, as is fully demonstrated here by the constant appearance of the honey bee from morn till high noon.

Its habitat is clay, gravel, rock and limestone. Our river bluffs are car-bonate and magnesian limestone, our streets and gutters are Macadamized streets and gutters are Macadamized and paved with this stone, and in this the bee plant finds its most attractive home. Hundreds of plants can be counted in sight by the writer of this, that will measure 5 feet in circumfer-ence and 5 feet in height; how is that for your 30-inch drills and 6 inches apart? Before commencing this artiapart? Before commencing this article, through curiosity and to be able to speak from actual knowledge, I went across the streetand counted the pods on one stalk alone out of hundreds of the same kind all around. They numbered 272; the space occupied was 5 10-12 ft., height 5 8-12 feet, circumference of stalk 1½ inches. No rain here for nearly 3 months, yet they are green, luxuriant and beautiful.

No animal will touch them, and they outgrow everything they come in contact with, thus proving the "survival of the fittest." Sow the seed anywhere—among rocks, on eraggy hill-sides, along the highways, in fence corners where nothing useful will corners where nothing useful will grow, and where the winds and rains will spread them, and in a few years your waste places will prove attractive to the eye, and yield abundance of sweets for the table.

LeClaire, Iowa, Sept. 1, 1881.

[Mr. Dodds has our thanks for his very interesting article, which our readers will appreciate. We have never seen it growing so luxuriantly as he describes; but if we had, we would not modify our advice regarding planting distance in the drills, as not every seed sown will grow, nor will the majority. It is much easier to cut out a stalk here and there, if necessary, than to replant.—ED.]

#### Western Stock Journal. Management for September.

O. CLUTE.

The long continued drouth has, in some sections, cut off all hope of a tall honey harvest. During the last of August bees should be gathering honey rapidly from buckwheat, heartsease, Spanish needle, golden rod, asters, etc. But this year the dry weather has cut off most of these flowers so badly that the bloom is very light, and but little honey is coming in. Some of the hives are storing a small amount of surplus; others are getting scarcely more than is needed for brood rearing.

Probably the most profitable thing for every bee-keeper, is to see that his hives are now put in good condition

for winter.

1. See to it that there is plenty of honey in the brood chamber for the bees to winter on. About 25 lbs. is the amount needed. This should be

good sealed honey.

2. Contract the hives to 8 frames. and put in the division boards. This gives smaller space for the bees to keep warm during the winter.

3. Have the covering of the frames

fit close and tight, so that there are no currents of air passing upward through the hive

the hive.

4. It is a good plan to cut a winter passage through the combs, about 2 inches below the top bar. A hole half an inch in diameter will do. This gives the bees a passage from comb to comb, without going around the side of the frame. Hence in cold weather, when the bees are closely clustered between the combs, they can go from comb to comb through causered between the combs, they can go from comb to comb through these passages, and so reach honey which would otherwise be inaccessible. Two small strips, a foot long, 1½ an inch wide, and 14 of an inch thick, laid 12 an inch apart across the tops of the combs, will answer the same purpose same purpose.

The bees that live over winter and

The bees that five over winter and start work in the hive early in the spring, are the young bees that are hatched in the fall. Now if no honey is coming induring the fall, the queens stop laying, brood rearing ceases early. and the bees go into winter quarters with none but old bees in the hive, These naturally die off during the win-These naturally die on during the win-ter, or in early spring, before young bees are reared in their places. This is one of the causes of much of the disaster in wintering. The remedy is disaster in wintering. The remedy is to feed the hives a small amount each day for two or three weeks after honey gathering ceases. They can be fed at night, by putting the feeders into the rear end, or into the top of the hives. Two ounces of sugar made into a thin

year. To this end the bees should be Italianized. Those who have already Italian bees can testify to the supe-riority of this breed. Those who have black bees should now prepare to Italianize next summer.

One method of Italianizing is to buy of a queen breeder a fertilized queen for each hive, and introduce her soon as she is accepted the work soon as she is accepted the work is done. All bees produced from her eggs will be Italians. Soon all the old bees will die off, and the young yellow-backs will take their places. But this method is somewhat expensive, and we do not advise it. It is such a degree and wise for the less with the second wind the second w sive, and we do not advise it. It is much cheaper, and wiser, for the beekeeper to buy 1 good Italian queen, introduce her now to a good colony of bees, and then another year grow queens from her eggs for all his hives. Of course the queen can be bought next spring, but often it is not so easy to get them in the spring. Moreover, as they cannot be sent out by mail or express until the weather is somewhat warm; your operations in queenrearing in the spring will be somewhat retarded. what retarded.

To buy an imported Italian queen

To buy an imported Italian queen from a reliable importer is a good way to begin. In our apiary we have 2 queens of Dadant's importation. One was bought in 1880, for which \$8.00 was paid; and one bought in June, of this year, for which \$4.00 was paid. From these queens and their progeny we have reared all our queens.

But it is hardly necessary now to get an imported queen. The Italians that have been carefully bred in America, are fully equal to their ancestors in Italy. A good, home-bred Italian queen will Italianize an apiary instance and proposed their angles of the state of the sta just as well as an imported one, and can usually be bought for about half the cost of an imported one. Good tested, home-bred Italians can be bought at from \$2.00 to \$3.00. Untested queens can be bought for somewhat less.

what less.
Having got your queen, whether imported or home-bred, put her in a small wire-cloth cage, made by rolling up a small piece of wire cloth about 4 inches long, and putting a plug into each end. A short piece of corn-cob makes a good plug. Put the queen in the cage, then select the hive in which you desire to not how smaller. in which you desire to put her, smoke it, open it, blow smoke on the tops of But it is best not to smoke on the tops of the frames if you are much afraid. But it is best not to smoke much, for it makes the queen hide. Then lift out the frames one by one, and examine each for the queen. If not on the frame, set it in an empty hive at one side, and go on to the next, and so on until the queen is found. When found, kill her. Then put your Balian queen kill her. Then put your trainan questient two combs, pressing them against the cage, so as to hold it in place. Shut the hive and let it stay.

Then open, smear shut for 48 hours. Then open, smear the cage with honey, take out one of the plugs and smear honey on the open end of the cage; set the honey running by drawing a knife over the honey near the cage. The queen will thoney hear the cage. The queen will come out, and the bees, busy with honey, will accept her for their queen. Often the introduction can be made in 24 hours, and without so much trouble to smear with honey. But for a beginner the course here recom-But for mended is safer. Iowa City, Iowa.

### Ants in the Apiary.

A. B. MCLAVY.

The remedy I use strikes at the root of the trouble, and if persisted in for a short time, will effectually remove them

ant-bed until you find the nest, which will be known by the white eggs. Then pour on your water, and make the dirt into a thin mud, right in the the dirt into a thin mud, right in the nest, and pour the water on plentifully, so as to effectually poison the very earth. By this means you dispose of ants and queen ant, and unfit the larvæ for reproduction. You may miss destroying it the first trial, but you will eventually clean them up. Keep the cyanide of potash out of reach of children, as it is a violent poison. It retails at the drug stores for about \$1 per lb.

I would thank you to tell me why a young queen which has 2 or 3 combs

young queen which has 2 or 3 combs of brood, with the combs built from worker foundation, lays drone eggs here and there in the brood nest, right among the worker cells. I have one which has some 13 drone cells capped in the worker comb. She seems to be prolific, and her bees are nice workers. They do not seem to have bargained for the drones, as I found one, and for the drones, as I found one, upon lifting the frame out, tugging manfully at one poor drone which was not capped, and, as I lifted the comb clear of the hive, off it went with its

Allow me to express my own thanks (with those of others), to Prof. Cook, for his valuable contributions to your columns. They are always to the point, and invaluable to the beekeeper. I wish the BEE JOURNAL wealth and prosperity.

Bastrop, Texas.

[The laying of drone eggs in worker cells is of frequent occurrence, especially with queens that are tardy in mating.—ED.]

### Improving Honey Plants.

D. K. BOUTELLE.

For several years past, much has been said in the bee-papers in rela-tion to securing honey from red clotion to securing honey from red clover. Some have proposed lengthening the tongues of the bees, while others have talked about shortening the corollas of the clover. In the last weeks' BEE JOURNAL, Mr. Dadant recommends going at the business both ways." That is it exactly; breed both ways. I now have a recollection which may possibly throw a

breed both ways. I now have a reconstruction which may possibly throw a ray of light in the clover direction.

From some 50 to 60 years ago, when a boy, my home was at Westminster, Vt., by the banks of the Connecticut river. I remember that the farmers in that vicinity used to raise a kind of red clover known as the "Darby clover," sometimes called "early clover." They liked it, they said, for

these reasons:

1. The straw being finer than the old or large clover, made better hay for stock.

It was ready to cut two weeks earlier

earher.

3. By giving it a sprinkle of plaster of Paris, they got a good second crop.

I remember, too, that it was said to have been obtained by a man by the name of Darby, by selecting the earliest, smallest heads, and then from clover grown from the seed of these, selecting the earliest and smallest again, and continuing to do so several times. I remember that they got heavy crops

Now if such a clover can be very generally raised, with equal or greater generary raised, with equal or greater profit to the farmers than the coarser kind, and have it bloom two weeks earlier than the white, and then get a second bloom after the white has passed, and have the bees breed up, and the clover down until they match, it would be a nice arrangement.

1 would be a fince arrangement.

1 have little, or no doubt it may be accomplished. It is probable then, that the clover, if put on rich soils, may tend to a reversion towards its former large size; but an occasional selection of the smallest may be made selection of the smallest may be made so as to keep it down, and so of thees to keep them up in size a length of tongues. Let it be tried.

Lake City Minn., Sept. 3, 1881. and

Kentucky Bee Keepers' Association.

The second annual convention of
the Kentucky State Bee-Keepers' Asthe Kentucky State Bee-Keepers' Association, will be held in the Exposition Building, in Louisville, Ky., on Wednesday and Thursday, Oct. 12 and 13, 1881. The following is the programme: Wednesday, Oct. 12.—Addresses as follows, to be followed by discussion: by discussion:

of discussion:

1 to 5 p. in.—"Manner of Transferring Bees, and When to Do It;" W. T. Sears, Bowling Green, Ky.

"Should We Encourage All to Keep Bees, or Only Those who will Make a Specialty of Bee-Keeping;" Dr. E. Drane, Éminence, Ky.

"The Pleasures and Profits of Bee-Keeping;" James Erwin, Claypool, Ky.

Ky. 7 to 9.—Receiving new members.

Miscellaneous business.
"Foul Brood, Prevention and Cure;"
Chas. F. Muth, Cincinnati, O.
"Honey Producing Plants, and How
to Cultivate them;" W. T. Stewart,

Eminence, Kv.
Thursday Oct. 13, 9 to 12.—Report of nominating committee. Election of officers and installation.

of officers and installation.

Bees Doing Well on Fall Flowers. There are 25 bee-keepers in this town-ship, 6 miles square, and 1 think that 1 am the only one who takes a bee-I am the only one who takes a bee-paper. I do not see how any earnest bee-keeper can, after seeing a copy of the American Bee Journal, forego the pleasure of receiving such a journal as yours once a week. I find more useful information in an issue of the Bee Journal, than in any of the monthlies. I admire the any of the monthlies. I admire the any of the monthles. I admire the fairness with which you treat the theories of different writers on disputed points. I had but 2 colonies to commence with in the spring; have taken some honey, and increased to 6, and N. E. France. Sec., Platteville, Wis.

been disappointed by the queen-breeders. Out of 4 ordered, 4 received 1, and she lays but a few dozen eggs daily, while one of my own rearing fills a Longstroth frame in 21 hours. My bees have done well during May and June; they filled up nicely with dandelion honey of extra quality, and then worked on red clover till the 1st of July, when the drouth cut off all honey. White clover seemed not to yield honey; I did not see a dezen bees on white clover this summer. During this month they have done well on buckwheat, smart-weed and golden rod. They are crowding out the queens with honey (I have no ex-tractor yet) and cannot be induced to work in sections, even at the sides, though I use bright foundation and white comb in the sections. I hope that the Bee Journal may prove a great success financially, as it is practically.

M. E. DARBY.

Dexter, Iowa, Aug. 30, 1881.

Cheap Foundation Machines.—Please answer the following questions: Have you ever seen any of the foundation machines advertised in the Ber Journal, price, \$5.00? It seems to me if they were all right they would be just the machine for a small unique of 50. the machine for a small apiary of 50 or 100 colonies; I would like to hear from some one who has seen them. Would it do to sow sweet clover with wheat? We are having very dry weather here now, and should it con-tinue till late in the fall, would it not be best to wait till spring before sowing? How much seed per acre?

JOHN CRAWFORD.

Pleasant, Ind., Sept. 1, 1881.

[We have not seen the machine, and know nothing more of them than the advertisement says. Undoubtedly sweet clover will do well sown with wheat. Plant it this fall, 6 to 8 pounds per acre.—Ep.1

California Honey Crop.—The honey season in the 3 lower counties, which are the the main boney producing counties of the State, are nearly a failure; the only apiaries that have taken any surplus, as far as 1 can learn, are located on the south side of the Sierra Madre range, and are but about 15 miles in length, extending 2 miles west of the San Antonia Canon on the west of the San Antonia Canon on the west, to Lytle Creek on the east, and will, taken all together, average about  $\frac{2}{3}$  of a crop. Honey here is bringing a good price, but is mostly amber colored, the amount of white ways good. white sage honey being very small. The amount of honey in this neighborhood is about 50,000 lbs., most of which is still held by the producers.

A. A. DEXTER, JR. Cucamonga, Cal., Sept. 1, 1881.

832 Pages for \$2.—I have received a lot of the special edition of the BEE JOURNAL for 1882, and I am well pleased with the change; it gives us pleased with the change; it gives us more reading matter, and will be in a more convenient shape for binding and preserving. It will be the cheap-est book on bee literature extant. 832 3-column pages, quarto size, for \$2, and I number is well worth the sub-ministrative and a limit good year about and I number is well worth the subscription price. I will send you about 100 names to whom you may send sample copies of the American Bee Journal. I am trying to awaken an interest in bee culture in Texas, and hope by the coming spring every beekeeper who has enterprise enough, will take a bee periodical of some description. I wish you a success in all your undertakings. scription. I wish you a success in a your undertakings.

W.M. R. HOWARD.

Kingston, Texas, Sept. 1, 1881.

[Dr. Howard's compliment is very gratifying; and such articles as he has given us, help to earn it.-ED.]

Dried to a Crisp.-We have had over 2 months without rain, and all vegetation is dried to a crisp. The country is now suffering, and the poor must suffer greatly during the coming winter. W.S. RAINEY W. S. RAINEY. winter. W. S. RAINI Columbia, Tenn., Sept. 1, 1881.

Hopes Revived.—My hopes revived this morning when I noticed my bees were hard at work, coming in heavily laden with honey and pollen. Wishing to know where they obtained it, I went to the slough and creek, which are <sup>1</sup>4 to  $\frac{1}{2}$  a mile from my apiary. I was surprised, when I reached the flat, botsurprised, when treached the hat, our tonn fields, to find my bees gathering pollen and honey from cockle-burr blossoms, which were so thick that a person could hardly walk through; it was covered with bees, and there was plenty of the broad Spanishneedle and some boneset in bloom, but there was not a bee on anything but the cockle-burr, except a few on the rank horse-weeds. I was not aware that hose would gather pollen and honey from it. What are its merits, and is it good for the bees? I inclose a twig that grows in clusters near my apiary, and is just beginning to bloom. I noand is just beginning to bloom. I no-ticed last year that it blossomed till frost, and the bees abandoned every-thing else for it just before frost. Tell me its name and value as a honey plant. As there are two kinds of Spanish-needle (that and round) please tell me if there is any difference in their value as honey producers, and their proper names. Prospects are better to-day. No rain yet; not so hot, and a little cloudy. I am glad we are to have the cloudy. I am glad we are to may come BEE JOURNAL next year in such a bandy form.

R. M. OSBORN. handy form. R. M Kane, Ill., Sept. 1, 1881.

fMr. Osborn need not be surprised that cocklebur (Xanthium) yields nectar, as nearly all the composite plants do so more or less, while many yield most bountifully. The twig inclosed is from another plant of the same family. It is an aster. I think that all species of Bidens (beggarticks) yield honey. There are five species.—A. J.

My Experience with Bees.—I had kept bees (are rather let them keep themselves), about 30 years. In January, 1879, I bought a copy of Cook's Manual, and read up the subject through the winter. In June, I took 3 box hives and went to live with a man who had an experience of several years, and had the reading of the AMERICAN BEE JOURNAL. I increased to 12, wintered in the cellar, putting them in Nov. I, and took them out April 1, 1880, alive, but weak. They kept dying until I had but 4 left. I increased to 8, but obtained no honey from them; but they had enough for wintering. I had I tanket no oney from them; but they had enough for wintering. I had I colony stolen, bought I in its place, left them on the summer stands, last winter, making outside bives; the sides, 3-inc has exering I had 5 left, but work in the suring I had 5 left, but work in the spring I had 5 left, but weak. I bought a weak one, increased to 8, and extracted 245 lbs. of white honey, leaving them in good condition for winter. I took 2 box hives on shures, last spring, have increased them to 8, and extracted 150 lbs of white boxes. and extracted 150 lbs. of white honey and extracted 150 lbs. of white honey. Unless I see some plan, before putting them in winter quarters, that I think would be better, I intend to put them in the cellar and put the chaff bives around them, when I put them out in the spring. Cyrl J. Asselstine.

Lyn, Out., Sept. 3, 1881.

Extracted Honey in Canada.—Bees have been doing nothing since the last of July, owing to the protracted drouth; everything is withered. I increased from 55 colonies in the spring to 97, and took 3,000 lbs. extracted, and 300 lbs. comb honey. Grocers and the public are getting very suspicious of buying extracted honey in Canada, as some has been placed on the market in an unripe condition, and after-wards fermented; others have no faith in the purity of extracted honey, and won't have it, as the public won't buy it. There will be a very fine display of honey exhibits and apiarian appliances, at the Toronto Exhibition, next month.

1. C. Thorn, M. D.

Strootsville, Can. Apr. 31, 1881.

Streetsville, Can., Aug. 31, 1881,

Dwindling.—I had a small second swarm the first part of June, which I put in a Langstroth improved. As I was moving from that part of the county, the bees were removed half a mile. I went to see them and others which I left about the 12th of Jule. mile. I went to see them and others which I left about the 12th of July. They appeared to have decreased con-They appeared to make decreased considerably. I took the top box of another, and drove the bees from that into the weak hive. They appeared to be doing better for some time, but of late they seem to be decreasing. A large swarm which came out about 3 weeks ago was added a few days since. weeks ago was added a few days since. They have plenty of combs but no honey, and in order to winter them they must be fed. I see Prof. Cook recommends coffee A sugar. I do not know it by that name; is it the common Sc. sugar? Can you recommend a simpler feeder than that which Prof. Cook describes? I am in a country Cook describes? I am in a country where the old straw "skep," as they call the hive, is in use. Their method is to kill the bees in the fall, and those they do not wish to treat so cruelly are left on the summer stand, without more protection or care than in sum-mer. I winfered but two colonies last eason, which were the first I ever had What was the cause of the dwindling ?

J. Roadhouse. Lakefield, Quebec, Aug. 17, 1881.

[Your moving the swarm but half a mile would cause the dwindling, as most of the field-workers probably returned to the old location; it is also probable the queen is worthless-she should have filled the hive with brood after the first dwindling occurred, and you should have investigated her value when you examined the hive in July. Coffee A sugar is the best grade, and next to granulated in price. It is preferred, because less liable to contain glucose, and is easily dissolved. The simplest feeder is an old fruit (or similar) can with the top removed, fill with sugar syrup or honey, tie a cloth over the mouth, place two square half-inch sticks on top the frames, and invert the feed cans on these.—ED.1

The Drouth-Cyprian Bees, Etc.— The drouth continues all over our state. In the most favored localities, the corn and hemp crops are cut at least 50 per cent. below the average, and the tobacco crop is nearly ruined. In many places the condition of things is simply desperate. Our fine blue In many places the condition of things is simply desperate. Our fine blue grass pastures would burn like a flash. Stock water is failing rapidly; no rain, no dews. The case of the poor honey bees is gloomy indeed. Not a flower is to be seen in the land, except the tough iron weed. Few colonies will live to see the flowers open next spring. Of course progressive beekeepers will feed those under their eare. I am now feeding 6 or 7 colored. care. I am now feeding 6 or 7 colonies that have come to want at this mes that have come to want at this early stage of the game. I would like to reject the doctrine of "parthenogenesis" if I could find a more reasonable theory. The substitute offered by Mr. C. J. Robinson, is simply mon-strous. Sexual impregnation through and by means of the digestive organs is too unreasonable and improbable to is too unreasonable and improbable to entertain a single thought. It is even worse than blind parthenogenesis. Mr. Dadant's evil report concerning his Cyprian bees, imported "by way of Italy," don't sound well after advertising and selling them. I suspect that he has got them mixed with those "gentle dark Italians" of his. If I wanted to breat up a game race of wanted to breed up a game race of bees to engage in a prize light. I would commence by crossing the Cyprians with Mr. Dadant's "dark Italians." The robust Cyprian joined win the ferocious "dark" hybrids, would culminate in just such a storm as friend Dadant describes. In justice to the Cyprians, 1 wish to say that I have handled them for a year past, imported stock, and crossed with pure talians, and although they have a

if handled gently, they submit nicely. My Cyprians have passed through the most trying ordeal in the last 6 weeks of drouth and famine, and their behavior has differed but little from that of my Italians and hybrids. If they once get the faste of stolen sweets however, their energy is simply terrible. G. W. Demaree.

Christiansburg, Ky., Aug. 27, 1881.

Explanation of Mailing Label.—My time is out at the end of September, but the label on the paper shows it out now; it ought to read Oct. 1, as 1 paid to that time. My 32 colonies have given 1000 lbs. comb in sections white, 500 lbs. extracted white, and 200 lbs. dark, and more coming now. John L. Davis.

Holt, Mich., Sept. 5, 1881.

[The mark on the wrapper label is all right. Subscribers are entitled to the BEE JOURNAL till the end of the months printed on the label.—ED.]

130 lbs. of Surplus Honey per Colony. —I enclose slip from the premium list of the Chickasaw Co. Fair. You will see they have offered the Ameri-CAN BEE JOURNAL as premiums, but they have made a mistate in giving it for a second instead of first premium, as I suggested. They have promised to change that another year:

Division I-Class No. 21

Best sample box honey, quality and style of package considered, \$2.00; 2d

best do., American Bee Journal.

Best sample of extracted honey, \$1.50; 2d best do., American Bee Jour-

Best display of honey by one exhibitor, \$2.00; 2d best do., American Bee Journal.

The honey yield has not been as good The honey yield has not been as good since the 15th of July, as it was before that time, yet I shall have at least as large an average yield per colony, as I had last year, viz: 130 lbs. per colony. I am sure of at least 14 000 lbs. from my 108 colonies, and will have more if September should be as favorable for better was it is sometimes. honey as it is sometimes.
O. O. POPPLETON.

Williamstown, Iowa, Sept. 1, 1881.

Getting Rid of Fertile Workers. rave had some experience with getting rid of fertile worker, and have concluded that the most profitable way is to let them work on what combs they can take care of until the close of the honey season, and then take away their combs and let them go. But if their combs and let them go. But if a person is anxious to increase his colonies I will say that, like introducing queens, you may succeed in all of the offerent ways, but none of them are always sure. They are like all rules in bee-keeping—have many exceptions. The way I have done this year is to take a strong colony that has plenty of brood, and after smoking both colonies thoroughly, mix all together and divide equally, putting eggs in each hive. This has not failed me gether and divide equally, putting eggs in each hive. This has not failed me this year, but may next every time; so with all rules in the business. Some of my tender-hearted bee friends may think it cruel to take away their honey but they must remember that these bees, with the best nursing, will not live until November.

E. B. SOUTHWICK.
Mendon, Mich., Sept. 3, 1881.

Honey Season in Florida. - We commenced in the spring with 250 colonies. From about 50 of these no increase or surplus; 200 have given us crease of surpus; 200 have given us 80 swarms, 836 gallons of extracted and 1.850 lbs, of comb honey, in 2 and 3 lb. sections. We expect 200 gallons more of extracted. It has not been a spring was backward. We will not mention our wax, as we intend working it up into foundation, on the Dunhan machine, which we find upon frial is good enough for us. We find our Italians, which we bought from Dr. J. P. H. Brown, have given us about rather dangerous, inquisitive appearather dangerous, inquisitive appearance when the hive is first opened, will Italianize all as soon as we can.

We often get letters inquiring about our transportation and market. we transport our honey 14 miles in at times, as in extreme cold weather row-boats down the Chippola river, to the frost sometimes makes its appearits junction with the Appalachicola, where we reship on steamboats. The nearest market is at Enfala, Ala., 300 miles distant, where a fine quality of extracted honey brings \$1 a gallon, and 10(a)5c. per lb. for comb; Columbus, Ga., 600 miles, same price; Macon, Ga., 600 miles, same price; Macon, Ga., freights are higher, as it leaves the river, and a fine quality is worth \$\$1.10(a)1.20; Atlanta. Ga., is about the same. We have packed this crop in \$\$1500 and \$\$1.20 and \$\$5\$ gallon cans. Our returns so far have netted from \$\$71\frac{1}{2}\$ to \$\$1.05\$ per gallon for extracted, and about \$\$12c\$, per lb. for comb. We and about 12c, per lb, for comb. We have a disease among our bees similar to that described by Quinby as foul brood. Success to the good old AMERbrood.

1CAN BEE JOURNAL.
ALDERMAN & ROBERTS.
Wewahitchka, Fla., Aug. 26, 1881.

Melilot and Spider Plant.—I inclose two specimens, the seed of one of which was purchased for spider plant. It has been in full bloom for one month. and the terrible drouth has no effect on it, but I have the first bee to see on it yet. I think it may be there is some mistake about the seed. The other I bought for melilot, and I have never seen a bee on it. Are they the genume plants? R. W. KEENE, M. D. Versailles, Ky., Sept. 3, 1881.

[The specimens sent are true to name. We do not know how to account for the bees not working on them, unless it be that there is very little of it in bloom, and bees are not yet attracted to it. We had a few cleome plants in bloom last summer, and again this season, and have never seen a bee on them, although the melilot in close proximity was alive with bees all the season, yet we know the cleome is a good honey plant, and a favorite with the bees where it grows in large quantities.—Ed.]

Poor Honey Season.—About all the bees in this county died last winter, and what few are left are doing poorly. Last spring I had 8 left out of 23 good colonies. I have increased to 18 now, colonies. I have increased to 18 now, and they are storing buck wheat honey very rapidly now. I have no extractor, and some of them are crowding the queens out of all but 1 comb. I have to take the full combs out and replace with foundation. I use a hive 13½x14 with a super cap that covers all; the frames are 12x12 inches, and the section boxes are 4x6 inches. Bees done tion boxes are 6x6 inches. Bees done better in these hives last winter than any other. I have known of but 4 natural swarms out of about 60 colodry until this week, we have had 2 good rains. I have had 5 years' study and 3 years' experience with bees, and ann 20 years of age. I found one colony in the timber late in the fall of 1878; this I It dianized in 1879, and have obtained a new queen every season for cross breeding. The BEE

Journal cannot be beat.

Thos. Chantry.
Casey, Iowa, Aug. 30, 1881.

Size for Nucleus Hives.—In the Bee Journal for Aug 3, I notice a question is asked by Mr. S. Coulthard, of Preston. Ohio, who wishes to know the best size for nuclei holding Langstroth frames. I make all my nucleus hives to hold 4 Langstroth frames, and think that they are the handiest, especially where we want to reur bees to sell by the pound. I observe many are giving their report for the season. My bees have earned me an average of \$17.29 for each colony I had last spring. Size for Nucleus Hives. - In the BEE \$17.29 for each colony I had last spring, and each colony has increased to four. How is that for Indiana? We had the heaviest yield of linden honey I have ever seen. I am looking for a good fall crop. I like the BEE JOURNAL best in its weekly form; success to it. GEO. W. BAKER. Lewisville, Ind., Sept. 3, 1881.

About Winter Temperature.—Wishing to increase the heat in my cellar at times, as in extreme cold weather the frost sometimes makes its appearance, can I do so by means of a kerosene oil stove, or not, for reason of the odor? 2. How best can I ventilate where no flue is at hand? 3. I notice the best temperature given is 42° to 50°; suppose frost is seen by condensation overhead, or a slight frost on the bottom of the cellar, does it materially affect the bees? 4. Are frost on the bottom of the cener, it materially affect the bees? 4. Are bees disturbed unless hives are touched, or are they sensitive upon the approach of a person, while in their winter quarters? 5. How small their winter quarters? 5. How small a nucleus will do well in the cellar with sufficient stores?
WM. WAKEFIELD.

St. Paul, Minn., Sept. 5, 1881.

[1. We do not think the oil stove

- would be advisable, because of the
- 2. By putting in a tube running to the outside.
- 3. No; if but slight.
- No; unless jarred. 4.
- 5. Two frames well supplied with bees, and with sufficient honey.—ED.]

Fair Increase, but Little Surplus, 1 bought 3 colonies in the spring of 1880, which gave me two swarms and 125 lbs. of surplus honey. Being sick, Host all but two colonies in the winter and spring for want of proper attention. I bought 10 more colonies, givme 12 to commence this season h. I concluded to let them swarm with. naturally, as I wanted increase more than honey. I now have 30 colonies, all but 2 in good condition, which I shall unite. Surplus crop will be light, on account of dry weather. One swarm that came off June 17th, which filled a 30 pound crate in 4 to 5 days after filling their hive, and last week I took off the same hive 18 sections 576, weighing about 35 lbs., and they will work some yet. I have not taken all my surplus off yet, but think I will have some 400 lbs. I am now preparing a cellar to put them in this winter where they will be by themselves.

Brookuboon N. Y. Aug 20 1851.

Breakabeen, N. Y., Aug. 30, 1881.

Seeds for Honey Plants.—Please inform us through the Bee Journal, who has melilot clover seed for sale, also seed for other honey plants, and young basswood trees, and oblige many subscribers.

J. VANDERVORT.

Laceyville, Pa., Sept. 5, 1881.

[See our advertising pages.—ED.]

Rev. Mr. Langstroth's Promise. Rev. Mr. Langstroth's Promise.—On page 218 of current volume of the Bee Journal, Mr. Langstroth wrote in strong commendatory terms of Mr. Hill's plan of preparing his bees for passing the winter, with a promise to communicate it to the Bee Journal, in season for us, to adopt if we are in season for us to adopt, if we approved of it. Having great confidence in Mr. Lingstroth's opinions in apiar-ian matters, I feel quite anxious to have it appear in the pages of the Bee JOURNAL, so as to give ample time to make the necessary prepara-tions, and not be hurried to do it when tions, and not be hurried to do it when the time has arrived for its use, as most things done hurriedly are apt to be slighted. The flattering prospects in June, and the foreput of July in this vicinity for a good yield of honey, was cut short by the hot and dry weather. Two weeks ago, we antici-pated that a few filled boxes of honey we had received would constitute the cron for the season, but, in suite of crop for the season, but, in spite of the dry weather, when the heartease came into bloom, the bees began to wake up and stir themselves, and for the past week have been storing in the boxes again, and as we have had a light shower of rain recently to revive vegetation, we may yet, perhaps, secure <sup>1</sup><sub>3</sub> of an average yield, if frost does not interfere with it.

L. James.

Atlanta, Ill., Sept. 7, 1881

### Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weckly, can do so by paying the difference.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

\*\* Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists —Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the old as well as the new address.

Constitutions and By-Laws for Associations \$2.00 per 100. The local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Faded or Gray Hair gradually recovers its youthful color and lustre by the use of Parker's Hair Balsam, an elegant dressing, admired for its purity and rich perfume.

There is More Strength restoring power in a 50 cent bottle of Parker's Ginger Tonic than in a bushel of malt or a gallon of milk. As an appetizer, blood purifier and kidney corrector, there is nothing like it, and invalids find it a wonderful invigorant for mind and body. See other column.

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents to pay except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the JOURNAL for a year free. It will pay to devote a few hours to the BEE JOURNAL.

It would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—
Also, if you live near one postoffice and get your man at another, be sure to give the address we have on our list.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums:

For a Club of 2,—a copy of "Boes and Honey."

3,—an Emerson Binder for 1882.

4,—Cook's (Bee) Manual, paper.

5,—
6,—Weekly Bee Journal for 1 year.

We have a SPECIAL EDITION of the Weekly Bee Journal, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, (

The following are the latest quotations for Honey and Beeswax received up to this hour

#### CHICAGO.

HONEY - New honey is coming in freely and the demand is good.

We quote light comb honey, in single comb boyes, 188200; in larger boxes 2c. less. Extracted

BEESWAX Prime quality, 186 21c. AL. H. NEWMAN, 972 W. Madison St.

NEW YORK.
HONEY—There is no settled market price yet or honey, as there's none setting.
We quote as there's tones willing more, both for; dark, in small boxes, 120,150; Expanded, white, 1964 [2c; dark, 70,30; BEESWAX - Prime quality, 220,240.
THORN & Co., 11 and 13 Devoe avenue.

#### CINCINNATI.

CINCINNATI.

HONEY.—Last week I paid King Cramer 17c, per lb. for a lot of about 2,000 lbs. It was in the Muth sections, 54,805, without separators. Every comb is perfect, which speaks well for the producer. If Mr. Cramer did not succeed, this season, in establishing rules for queen tertilization, he succeeded admirably in getting one of the finest lots of combiney in the country. Extracted honey is just commencing to be in good demand.

1 quote: Good combinney, in sections, is worth 140 (16. Good combined), in service, on arrival.

BEESWAX.—18c 22c., on arrival. I have paid 25c, per lb. for choice lots.

C. F. MC11.

HONEY—The prices of honey are not regularly quoted in our papers here. We quote: Honey in 1 pound sections retails at 25c.; in 2 pound sec-

Ons, 20c.
BEESWAX-P Ime quality, 25c.
CROCKER & BLAKE, 57 Chatham Street,

#### CLEVELAND

HONEY—Comb honey continues in good demand at 3 c. for 1 lb. white and 19c. for 2 lb. sections. Extracted honey, 19ca 12c. BEESWAX—18cd 20c. A. C. KENDEL, 115 Ontario Street.

#### BALTIMORE.

HONEY.-Both the supply and demand are too monzer to report. BEESWAX —Southern, pure, 21@23c.; Western, pure, 22c.; grease wax, 12@13c.-Ballimore Market Journal.

HONEY.—New. in 1 or 2 lb. sections, 22@27e.— Indianapolis Stock Review.

#### SAN FRANCISCO.

HONEY.—Sules of choice comb, to arrive, have been effected at 20c. for small lots. It is doubtful if an order for large lot of choice comb could be filled in this market. Choice extracted, in barrels, is quotable at 99.9%c. We quote white comb, 16@20c.; dark to go. d.10@14c. Extracted, choice to extra white, 99.00\(\frac{1}{2}\)c. Steambed candied, 8c. BEESWAX—23@c25c. STEARNS & SMITH, 4.25 Front Street.

### ST. LOUIS.

ST. LOUIS.

11ONEY.—Demand improving slightly; prices firmer.
We quote: New extracted, 75.9c.; comb, 146.16c.
Round lots sold—extracted in cans at 73.6c.84c., and choice comb in tancy pkgs, at 17c.
BEESWAX—Prime yellow sells at 25c.21c.
R. C. GREER & CO., 117 N. Main Street.

### PHILADELPHIA.

HONEY.-The supply and demand are alike nominal.

BEESWAX - Best light 23@25c.-Philadelphla
Merchants Guide.

## The Bee-Keeper's Guide;

### MANUAL OF THE APIARY, By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Hinstrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,00 copies was exhausted in about 18 months — a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineution of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings— the products of the Honey Bee; the races of bees; full desceriptions of honey-producing plants,trees, shrubs, etc., splendidly litustrated - and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—L'Apiculture, Paris.

I think Cook's Manual is the best of our American works.—LEWIS T. COLBY.

It appears to have cut the ground from under future book-makers.—British Bre Journal.

fature book-makers.—Britt-h Bre Journal.

Prot. Cook's valuable Manual has been my constant guide in my operations and successful management of the aparity:—J. P. WEST.

I have derived more practical knowledge from Prot. Cook's New Manual of the Aplary than Iron any other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who opinins it, will ever regret having purchased.—Mich. Far.

Is a masterly production, and one that no beekeeper, however limited his means, can afford to do without.—Nebraska Farmer.

do without.—Nebraska Fermer.

To all who wish to engage in bee culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Heroid, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward a waims its nuthor.—A. B. WENZEL.

My success has been so great us to almost astonish myself, and noull of it is due to the clear, disinterested information contained in Cook's Manual.—WA, VAN ANTWERP, M. D.

It is the latest book on the bee, and treats of both the lee and threes, with their linglements. It is of value to all bee-raisers.—Ky, Live Stock Record.

It is a creatit to the author as well the publisher.

value to all bee-raisers - Ky, Live Slock Record.
It is a credit to the author as well the publisher, i have never yet met with a work, either French or foreign, which I like so much, LiAnbig DU Bots, editor of the Bulletin D'Apiculteur, France.
It not only gives the matural listory of these industrious basects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees. Democrat, Pulitski, N. V.
Wa have present all producing those such as a consideration of the such as a co

producing plants, and an extended account of the enemies of bees. Democrat, Pulaski, N. V.

We have perused with great pleasure this wode means of the beek keeper. It is replete with the best information on everything belonging to apiculture. To all taking an intere t in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—Agriculturist, Quebec.

This book is pronounced by the press and leading becomen to be the most complete and practical testise on beecculture in Europe of America; a scientible work on modern bee management that every experienced been an will wele me and it is essential to every anatour in bee-culture. It is handsomely printed, nearly bound and is a credit to the West.—Western Agriculturist.

This work is undoubtedly the most coopete manual for the instruction of beekeepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees let unito, check, and in the computation of the work Prot. Cook has had the advantage of all the previous knowled of an pairsts which he asses admently to promote and make popular this most interesting of all occupations.—American Insentor.

It may safely be promounced the most complete and comprehensive of the several manuals which

admirably to promote and make popular this most interesting of allocaupations. —Ano recan Inventor. It may safely be promounced the most complete and comprehensive of the several manuals which have recently appeared on the subject of bees and their handing in apairies. The studies of the structure of the bees, the different varieties, the various bee products, and following these the points of management, extending to the smallest details, are all of high and practical value. Prof. Cook has presented the latest phases of progressive bee-keeping, and writes of the themes discussed in the light of his own experience.—Pacific Rural.

Of the many excellent works which we have examined on bee-culture, we consider Prof. Cook's the most valuable for the study of those who contemplate going into the business or are already keeping bees. If thoroughly studied, and its teachings conformed to, by the apairist, who exercises a reasonable degree of common sense, he or she cannot fail to achieve at least a reusonable degree of success. The author ad resses himself to the work with a degree of enhusiasm which carries the reader with him to the end.—Kunuss Farmer.

Cook's Mannul of the Apiary holds in America

the reader with him to the end.—Kanusa Farmer.
Cook's Manual of the Aphary holds in America
the same high rank, that is accorded in Germany
to) he book of which Dzterzen is the author; the
only difference being that Prof. Cook's Manual
combines the protoundness of the German pistor
with the superiority of the practical American.
He refers in several instances to Dawwii: and
does not belong to that class which hates everything that is foreign, for he speaks of German natuntilsts with great reverence.—German Freidenker,
Milwankee, Wis.

## POPULAR HONEY KEGS

Small Keys for Honey.

These kegs answer the popular demand for honey in small packages, and when compared with large barrels holding from compared with large barrels holding from 300 to 500 lbs, each, they are fully as cheap and often cheaper. They need no waxing but should simply be thoroughly scalded with boiling water before using. The leakage so often occurring in the large hard-wood barrels can be entirely prevented by using the White Pine Kegs. Considering the cost and trouble of waxing, the loss of honey by leakage, and the ease with which these kegs can be handled and shipped, with an actual saving in original cost, it must be apparent to all that they are the best. Prices:

### The National Convention.

It is now quite time for all who can possibly attend the meeting of the National Society at Lexington, on Oct. 5–7, to make their arrangements to do so. As previously announced, the editor of the BEE JOURNAL has an engagement for that time elsewhere. and it seems to be almost impossible to break that engagement, so as to be able to attend the meeting at Lexington. By the urgent solicitation of many of our friends we have endeavored to make arrangements by which we may be able to attend this important national meeting on the second and third days of its session-October 6th and 7th.

If it is possible to so arrange matters we shall be there, for our heart and soul are engaged in the work of furthering the interests of American apiculture, and to miss this Convention would be quite a sore disappointment to us.

Mrs. L. Harrison, in the Prairie Farmer, very aptly remarks: "It will pay bee keepers to attend this swarming of their fellows—pay in pleasure and in profit. May the 'swarming fever,' which is so hard to control, be contagious all over the country, until the largest swarm is there congregated. which was ever known. And when the discussions are over, we will hold an impromptu meeting in the annex Mammoth Cave."

### More Good Words for Sweet Clover.

The Indiana Farmer, which early came to our support in advocating the practicability of planting for honey. and recognized the superiority of melilot or sweet clover, has the following in reference to this season's experience with it:

From Mr. Wm. Schofield, an old veteran bee-keeper residing a few miles northeast of the city, we have the following satisfactory report in reference to our favorite honey plant, melilot. Uncle Billy, as he is familiarly known, has about two acres sown to melilot. He says it made a prodigious growth early in the season, but on account of the excessively dry weather matured its seed very early. It had almost quit blooming, when he turned the cattle on it. They soon had all the tops eaten off, and much of it was cut almost to the ground. of it was cut almost to the ground. Soon after the cattle were removed, when the melilot seemed to take a second growth, throwing out new shoots, and blooming as profusely as early in the season. As an experiment, he tried cutting back a part of it and reports the result year truers. it, and reports the result very favora-ble, as, after being cut, the plants throw out many more branches, besides growing tall and compact. He thinks if he had had a few more acres it would have paid better than any-thing else on the farm.

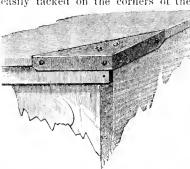

Now is the proper time to make preparations for planting melilot. Procure your seed at once from some reliable dealer, so as to feel assured of their freshness: then select the waste places that are now obnoxious to the sight because of weeds, or some portion of the farm where nothing else will grow to advantage. If no waste places exist, then set apart good soil for it, as it will much more than repay ground-rent. Prepare your ground as for clover, and lightly harrow in the seed this fall. Fall planting is much the best, as it insures a more uniform germination. If desirable, sow wheat with it; or, if bloom is wanted next season, sow cleome with it, or in the spring harrow in with it mammoth mignonette.

At the Chicago Fair, held Sept. 13-17, Mr. R. A. Burnett, Commission Merchant of 165 South Water Street. had a very creditable display of both comb and extracted honey. He deserves credit at the hands of beekeepers for his efforts in popularizing pure honey in our market. We are sorry to be obliged to say that owing to poor management, the exhibition of bees and apiarian implements was not what it might and should have been, had bee-keepers been given ample time and notice to prepare for it.

We hope another season the apicultural department will be one of the most attractive features connected with the Chicago Fair.

#### Metal Corners for Crate Covers.

From Mr. W. H. Fletcher, of Sauk Rapids, Minn., we have received a very simple little contrivance for ataching to the corners of crate covers. These can be made of tin, require no especial ingenuity to manufacture, are easily tacked on the corners of the

covers, and will be found very convenient by the grocer or family to hold the cover exactly in place, thereby effectually excluding flies and bees from the honey. The above cut illustrates a section of the cover with the tin corner attached.

Arkansas State Fair .-- We have received from Dr. W. W. Hippolite, of Devall's Bluff, Ark., the premium list of the Arkansas State Fair, to be held at Little Rock, Oct. 17-22, 1881. In the honey department, we find the following list of premiums, entrance free .

Best package comb honey, in the best marketable shape, 5 lbs. or more, \$5.00

Best package of extracted honey, in the most murketable shape, 5 lbs. or more, \$5.00

Best crate of honey in the comb, in the most marketable shape, 25 lbs. or more, \$10.00

Best colony of bees in movable comb hives, including their public manipulation, \$10.00 Best 5 lbs. beeswax, \$2 00

Best machine for extracting honey,

Best display of bee-keepers' supplies, Diploma.

An inventive genius in Kentucky says he is perfecting machinery to make rolls for foundation machines. If he succeeds, it will greatly lessen to have one on exhibition at the National Convention at Lexington.

### Cook's Manual of the Apiary.

The sixth edition (eighth thousand) of this popular bee-keepers' handbook is now ready. As the lengthened evenings of winter approach, every reading, thinking agriculturist makes out his schedule of text-books to be purchased for pleasurable and profitable study, with which to educate himself and family; and whether it be the intention to keep a few colonies only for recreation and family use, or a larger number for profit, this book will be found invaluable. In fact, no scientific or rural library is complete without it, and no education is finished. until it has been carefully and thoughtfully perused. In order to extend its circulation, and as an inducement to bee-keepers to assist in doing so, the price will be reduced to \$10.00 per dozen, bound in cloth, by express to one address. This is a liberal reduction on the retail price (\$1.25), making a saving of nearly 50 per cent. The last edition has been carefully revised, and contains the results of Professor Cook's latest scientific investigations and discoveries.

We are always glad to have articles copied from the BEE JOURNAL into other publications, but we must insist that the only honorable way is to give the BEE JOURNAL due credit for them. Several such are going the rounds that were stolen from our columns by some enterprising (?) paper, which are now credited to the thieving concern, and they look incomprebensible to some, as they refer to other articles in the BEE JOURNAL or its apiary, etc. The "New England Bee Journal" gives an article as original that was written by Mr. Chas. Dadant, and may be found on page 81 of the BEE JOHENAL for March 16, 1881. The original manuscript is now on file in this office. We know, of course, the failure to give us credit for the article was an oversight, but such omissions look badly during the first month of that paper's existence.

Honey in the Eastern Markets .- It will be observed, by reference to our market reports, that Messrs. Crocker & Blake, of Boston, report that honey sells quite freely in one-comb boxes, and add: "A large quantity could be the labor of making, and therefore sold in our market at from 20 to 22c., make the price much less for first class according to quality." Every day comb foundation mills. He promises furnishes fresh evidence that honey is a favorite with the public, and meets with a ready sale at good prices.

### St. Joseph, Mo., Bee and Honey Show.

Many of our readers are aware that the aim of the BEE JOURNAL has been to make honey a staple product. To this end we have endeavored to popularize the consumption of honey by the masses, as well as to raise the standard of production, by applying correct principles and progressive art to the management of the apiary. We have labored earnestly for this end, and now we begin to realize the results.

Bees and honey are already the great attraction at such fairs as have given prominence to this industry-and this will become more apparent each successive year. We were impressed with this idea at the St. Joseph Exposition. The officers of that association informed us that they were surprised at the result of their experiment in encouraging the apiarian department this year, and intended next year to give it far more prominence; they had realized the fact that it formed the greatest attraction presented by the Exposition. To the Superintendent of the Apiarian Department, R. S. Musser, Esq., an energetic and prominent lawyer of St. Joseph, and his faithful ally, Mr. D. G. Parker, as well as the Judges, Messrs. John Bays, J. A. Matney and S. P. Hyde, may be attributed the grand success of the Bee and Honey Show.

By particular request of the managers we gave a lecture on Bees and Honey at the Court House, on Thursday evening. The managing editor of the Gazette, a morning paper of that city, was present, as well as its reporter. The editor of the Gazette gave his views of the subject in the following article:

Few things last week, which brought rewthings last week, which brought us so many pleasant and profitable things, combined pleasure and profit to such an extent as the display of honey made at the fair and the lecture of Mr. Newman, of Chicago, on "Bees and lloney." The culture of bees is in its very infancy in this region. Until this year, there has been no noticeable display of honey at our fairs. The attention that was given to the subject this year marks a new era. The display attracted very great attention. Through the energy of the management of the apiary department, good prizes were offered and awarded. The bee-keepers of the region were encouraged and a more general interest was aroused in the subject. In fact, from this time the culture of the bee in Northwest Missouri seems likely to go steadily forward.

It is a great industry. How great. so many pleasant and profitable

It is a great industry. How great, only the few that are interested in it have any idea. It has never been extensively enough attended to in this tensively enough attended to in this immediate region to have brought any great profit. But there is money in it. And, besides the profit, there is a vast deal of pleasure. The management and manipulation of bees is such delicate work that many ladies have become distinguished apiarists. In fact, the business is capable of such extension and yields so much profit and the business is capable of such extension and yields so much profit and pleasure that it may open a new field for ladies' employment. The accomplishments of Mrs. R. S. Musser of this city in this direction should stimulate many other ladies to engage in it. Such delicions food, in fact, should properly be brought to our tables by our ladies' care; it is altogether fitting. our ladies' care; it is altogether fitting

Those who had the pleasure of hear-ng Mr. Newman's lecture on "Bees Those who had the pleasure of hearing Mr. Newman's lecture on "Bees and Honey," cannot fail to have new enthusiasm. To the unlearned, it was a revelation of the secrets of a great and mysterious industry. Im-

provement has followed improvement at such a rate in the structure of hives and in the instruments used in the and in the instriments used in the manipulation of bees and in gathering the honey, that the apiary is as complete as a factory wherein man's ingenuity does the work. The secrets of the hive have been laid bare and the little workers are made subject to the anipulational transfer of the majorists absolute management.

the apiarist's absolute management.
So profitable can the business be made that it is profitable to plant bloom for the little honey-workers. bloom for the little honey-workers. To grow honey is as profitable as to grow butter or lard. But the time when we in this region will find it necessary to plant for our bees is yet distant. There is honey-bearing bloom enough that grows by our streams and in our fields to supply avery table in Missouri. ery table in Missouri

It was a gratifying thing to hear so good anthority as Mr. Newman declare that, whatever else may be adulterated, the bees cannot be fooled with glucose. If honey be in reach, they will never store any thing else in their mystic cells their mystic cells.

Let us all catch the entire few colonies of bees are cheap. They become. We trust Let us all catch the enthusiasm. few colonies of bees are cheap. Liezy yield a delicious income. We trust that our local society of bee-keepers will keep up the enthusiasm; and, in a few years, we may count honey the cheap with the ch nt honey We have among our great products. We have as good a chance as any people in the

The synopsis of our lecture as given in the Daily Herald may be found on page 301. The reporter of the Gazette remarks as follows:

"An appreciative audience of sev "An apprenative audience of several hundred bee-keepers, ladies and gentlemen, assembled in the court house last evening to hear Mr. T. G. Newman, of Chicago, the editor of the AMERICAN BEE JOURNAL, deliver a lecture on "Bees and Honey." The meeting was called to order, and Mayor Piner, as chairman, who introduced Mr. Newman. The lecturer has made both a scientific and a practical straight of the scientific and a scientific and a practical straight of the scientific and a sc tical study of the apiary, and has earned a well-deserved reputation on both continents. It was a peculiar pleasure and a great privilege for the bee-keepers of this community to hear him. He is a pleasant gentleman, easy in his address and has an interesting manner in speaking. He was en-thusiastically received; and all that thus astrong received; and all that had the pleasure of hearing bim will not soon forget the occasion. He briefly stated the rise and progress of bee-culture and exhibited the most important inventions that have been made for the bee-keepers' assistance. The lecture was very practical and contained many hints that are invalucontained many hints that are invaluable. But practical as it was, the pleasure of the apiary as well as the profit was told; for Mr. Newman is an enthusiast, 'as,' to use his own words, 'all bee-keepers are.' His visit to St. Joseph is highly appreciated and will long be remembered. The vast benefit and endless pleasure that will ultimately be derived from the study of this subject and the profit of the industry by our people, will always most pleasantly recall Mr. Newman's services in adding to their enthusiasm in vices in adding to their enthusiasm in telling of improved management of bees, etc."

We have received a queen from Mr. D. A. Jones for trial and comparison in the BEE JOURNAL apiary, but the season is so far advanced it will be impossible to express any opinion this fall, except upon the appearance of the bees, when she has ample time to rear them. The queen is smaller than the average Italian, but was very lively, and cheerfully received in the nucleus to which we introduced her.

Badges. - Bee-keepers going to fairs should wear a badge with a gold bee on it. It will serve to introduce him to other bee men. We will send them

#### MISCELLANEOUS.

Ligarian Honey Bees .- In the Rural New Yorker Mr. G. M. Doolittle says:

In the Rural, we read, under the above heading, that "a year or two since many of our apiarians were quite enthusiastic in regard to the merits of igurian honey bees, as it was claimed that they were more industrious than that they were more industrious than either the common bee or the Italians," etc. This, I believe, was taken from the New York Sun. As it conveys a wrong impression I wish to say that Liguria is simply a province in Italy, and therefore Ligurian bees and Italians are one and the same thing. The correspondent of the Sun farther states, giving Mr. Taylor's book as his angiving Mr. Taylor's book as his authority, that these bees gather more giving Mr. Taylor's book as his authority, that these bees gather more honey by robbing the hives of common bees. This is contrary to the testimony of all practical apiarists (not apiarians as the correspondent of the New York Sm would have it). Practical experience in the apiary shows that the Italians are not as likely to rob as the blacks or hybrids, while they will defend their stores as long as there is a handful of them left. That they will gather more honey is a fact, and their chief value is their perseverance, in a poor honey season, in toiling on day after day for the little honey they can obtain, while the common bees seem to think that little is not worthy of notice. To illustrate:—In 1872, at the close of the season for basswood blossoms, from which our main honey crop is obtained, we did not have a single box of honey finished. At this time we had both Italian and common, or black bees. Soon the seed common, or black bees. Soon the seed crop of red clover commenced to bloom, on which the Italians went to work at once, but not a black bee was to be seen. As a consequence we took from some of our Italian colonies 60 pounds of box honey, while the black bees had eaten up half their stores from the basswood and had to be fed for winter. After this we were not slow in introducing Italian queens to all our stock.

Effects of Adulterations. - The Farmers' Review, speaking of oleomarga-

Oleomargarine has a new load to bear. Last week a whole family were poisoned by its use, though not fatally, and 4 laboring men suffered from the same cause. The malady takes a similar form to the lard-butter cholera, prevalent in Chicago last winter.

Bee Forage and Bee-Keeping.-The Farm and Garden, a new and sprightly monthly, issued at Philadelphia, Pa., is on our table, and is welcome as an exchange. In it Dr. J. P. II. Brown, Agusta, Ga., thus answers the following questions :

Is bee-keeping profitable? It is when properly attended to; and pays a larger dividend upon the capital than almost any other of the rural industries. Even in those localities where there are poor markets for honey, it pays to keep bees in order to secure a supply for family use. Honey can be profitably used in place of manufactured syrups which are now largely adulterated with glucose.

What are the requisites for success? A thorough knowledge of the natural history of the honey-bee and of its proper mode of management together proper mode of management together with a full acquaintance with the method of using improved apiarian implements. Such information can be obtained by reading and studying be books and periodicals, in connection with practical experience in managing the hive. There is still another whom our read terms and viging the such in the control of the contro

prime factor requisite for success. It is an abundance of honey producing plants. It is not true that the "busy bee" gathers honey from "every open-ing flower." Some flowers secrete ing flower." Some flowers secrete sweet nectar abundantly, while other's bloom gives forth scarcely any. The apiary should be located where there is plenty of bee-forage. There are other conditions such as the kind of season, state of the atmosphere, &c., &c., that must never be lost sight of in successful bee-keeping.

Who shall keep bees? Those only who have a taste for the business, and sufficient industry and energy to make

sufficient industry and energy to make an application of the requisite knowl-

edge just at the right time.

Bees and Honey at Nebraska Fair .-Mr. G. M. Hawley gives the following notice in the Nebraska Farmer:

The State Board of Agriculture has given us very liberal premiums on bees and honey, in fact they gave us all we asked for. Now it should be the duty of every bee-keeper to assist in making a display that shall be a credit to the State, and also to show the State Board State, and also to show the State Board that their liberty is appreciated. Beekeeping is a new industry in this State and one that is designed in a short time to play an important part in its rural economy, and behooves us now to see to it that it is properly represented. Wherever bees have been tried they have been so successful as to create a demand in that locality for o create a demand in that locality for them.

Let each read the premiums offered and then strive to make a display. In the premium list, where it reads "10 weeks," it should read "2 weeks." Also "comb foundation, partly grown." should read "partly drawn.

English Law Regarding Bees.-The aw with regard to bees is rather peculiar, says the London Law Times:

A dispute as to the ownership of a swarm came recently before Mr. W. F. Woodthorpe, the judge of the Belr. Woodthorpe, the judge of the Bel-per County Court, and it was conten-ded that being fere nature, there could be no property in them, and that, there-fore, the plaintiff, from whose land they had strayed to that of the defend-ant, could not demand their return or damages for their loss. It was proved, however, that the plaintiff had followed the swarm on their departure from his own land, and had not lost sight of them until he saw them alight in the defendant's garden. On the strength defendant's garden. On the strength of the following passage from Blackstone (vol. II., p. 392)—"Bees are feræ naturæ; but when hived and reclaimed, a man may have a qualified property in them by the law of nature as well as by the civil law. Occupation—that is, hiving or including them—gives the property in bees, for, though a swarm lights upon my tree, I have no more property in them, till I have hived them, than I have in birds which make their nest thereon; and, therefore, if another hives them, he shall be their proprietor; but a swarm which be their proprietor; but a swarm which flies from and out of my hive are mine as long as I can keep them in sight, and have power to pursue them, and in these circumstances no one is entitled to take them"—judgment was entered in favor of the plaintiff for the amount claimed as the value of his truant bees.

The Rural Canadian is the name of a new monthly farm paper, published at Toronto, Ont. The first number is on our desk, and presents a neat appearance. The great variety of useful and practical articles presented in the initial number bespeak for it a large subscription list. It is edited by the Rev. W. F. Clarke, whom our readers are well aware is a terse and vigorous writer. It contains 16 pages of the size of the BEE JOURNAL, and is published at \$1.00 a year. We wish the Rural Canadian

For the American Bee Journal,

### Reproduction in the Honey Bee.

G. L. TINKER, M. D.

After so many eminent investiga-tors have stated that the drone protors have stated that the drone progeny of a queen mating with a drone of another race, is not affected by the cross, it would not seem to be of much use for any one to dissent from their views. Yet it is manifest that they have overlooked some very important facts, which, if they were known, would necessitate a revision of the Dzierzon theory. I say manifest of the Dzierzon theory. I say manifest, since the theory does not hold true in practice, without which, its correctness can only be assumed.

To be true, the drone progeny of sister queens, bred from a pure blooded matter chould shave some degree of

mother, should show some degree of similarity in their marking, though one of them should have mated with one of them should have mated with a drone of another race, and produce hybrid workers. But we do not find it. In the one case the drones are imperfectly colored and inferior in many respects. In the other, there will be found great uniformity with the drone progeny of other sister queens that have purely mated.

The above tacts have been observed many times and always with like re-

many times, and always with like result. An Italian queen mating with a black drone, invariably begets a mixed drone progeny, many being well marked blacks, others being illy colored, with none so finely marked as those begotten of sister queens purely mated.

Further differences may be noted in the growth of the hairs at the exin the growth of the hairs at the extremity, and beneath the abdomen. On the pure Italian drone these hairs are short and thinly set upon these parts. In the pure black drone they are comparatively longer, straight, and thickly set, so as to be readily noticeable. In the drone offspring of Italian queens crossed with black drones, these markings resemble those of the purely black drone very much. So much so, indeed, that I have a settled conviction that there is black blood in such drones, notwithstanding blood in such drones, notwithstanding the Dzierzon theory to the contrary.

It is my opinion, therefore, that every egg deposited by a fertilized queen is impregnated in some way by the spermatozoa of the drone with which she mated; and if it chance to be a drone of another race, the entire

be a drone of another race, the entire progeny will be hybrid.

The principle of generation by which male and female elements are formed in the animal creation, has never been explained or understood. Like the principle of life, it appears to involve problems that are no nearer a solution to-day than they were ages ago. And until some of these principles are solved, we shall not be able to explain

the modus operandi of reproduction in the honey bee.

Meantime, if any theory be advanced that does not comport with well known facts, it may as well be abandoned.

The Dzierzon theory contemplates that the drones begotten of queens impurely mated are unaffected by such cross; but the standard for comparison must be the drones of pure queens of the same race. If the drones of impurely mated queens do not come up uniformly to this standard, it is plain that there is something wrong with the theory, that no amount of

with the theory, that no amount of philosophizing can ever establish.

So too with the theory that queens are impregnated with royal jelly (drone's semen), while in the larval state, enabling them to deposit eggs that will produce variable drones.

Manyayamiztions buye been made.

So too with the theory that queens are impregnated with royal jelly (drone's sennen), while in the larval state, enabling them to deposit eggs that will produce variable drones.

Many examinations have been made, but no drone's semen or spermatozoa have ever been found in royal jelly, and without this can be done by a competent microscopist, the theory must be held not only untenable, but

A very probable theory of the union of sexual elements is, that immediately after fertilization, the ovaries of the queen are not only influenced and bequeen are not only influenced and begin to develop eggs rapidly, but that there is also a primary fertilization, that affects in a general way, every embryo egg in the ovaries; and a secondary fertilization of the eggs in passing by the spermatheca by voluntary act of the queen when it is desired to deposit eggs in worker cells, and permitting the eggs to be deposited in drone cells, to pass by unaf ted in drone cells, to pass by unaf-

It is certain, at all events, that a It is certain, at all events, that a general fertilization of the ovaries is not less possible in the fully developed queen than in the larval state. It has not yet been shown that the drones of virgin queens possess full virile powers. Many have endeavored to get queens fertilized early in the spring by such drones, but have failed. In an experiment of this kind 2 years since. I wintered a virgin queen, and since. I wintered a virgin queen, and had a fine lot of early drones. The since, I wintered a virgin queen, and had a fine lot of early drones. The one queen reared to supersede her flew out many times every clear day for 10 days without success, until some drones appeared from another hive, when she became fertilized at once. Hence, it is pretty certain that the bzierzon theory is wanting on this point also, viz: that the drones of vir-

giu queens are not possessed of virility.

As to the transmission of certain qualities of the queen and drones, I think that the rules applicable to the animal creation generally will hold good in the honey bee.

1. The female transmitts the degree of fecundity, and determines the size and the form of the female off-

spring.

2. The male transmits the disposition and the energy to the female, and determines the size and the form of the male offspring.

It happens, however, from causes not yet understood, that some marked

exceptions to these rules occur, yet the rules may be depended upon in 4

cases out of 5 applied generally.

It has been further observed that the drone influences the coloring of the worker offspring in a marked degree, and so far as I have been able to judge, that of the drone offspring also.

Thus, it will be seen that I have

Thus it will be seen that I have given to the drone greater importance in the breeding of a superior race of bees, than has been generally acknowledged heretofore, and I feel certain that what I have seen, others have seen, and will be able to confirm what must be a very common observation.

### Wintering Bees in Texas.

WM. R. HOWARD.

At the close of the honey season we should examine our bees, and put them in condition for winter. To do this, we must first understand what are the requisites, and secondly, how to secure conditions to fulfill these

requirements.

Plenty of pure honey, the natural food, pure air, the natural element, and a full colony in a normal condition, with a prolific queen, are the principal elements of successful win-

Every full colony should have 25 or 30 lbs. of good honey to go through the winter safely, and should be given just what room they will occupy and no more. If they do not fill the hive, a division board should be used to con-tract the hive to the proper size, to accommodate our wants. Our honey

highly improbable; for semen without the sign of a single spermzoon, would be about as worthless as the irrepressible theorist without brains.

A very probable theory of the union of sexual elements is, that immediately might do, but we cannot recommend to the result of the results of the r it. If pure honey is to be fed, they should be fed all they need to carry them through the winter safely, as fast as they can store it away in the combs. Our hives should be protec-ted if possible from the severe northwest winds; orchard trees, close fences, sheds, or boards laid against the hives, will answer the purpose of wind-

Our hives should be water-proof entirely. Ventilation is unimportant—only the hive should be kept as dry inside as possible. Our temperature never runs low enough to make ice in the hive from the condensed moisture within the hive.
Our bees wintered last winter, some

with the boxes, upper chamber, etc., on, and others were covered as " tight on, and others were covered as "light as a jug," using close top frames with morticed entrances to upper chamber; the bees glued the top bars together in one solid plank so to speak (we use thin wooden blocks to cover the morticed entrances, which the bees glued that to the frame as a should in fast to the frame as soon as placed in the hive). We may see, by going among the old box-hive men, bees winter well in every sort of hive, some with the top only laid upon the box, and not nailed; others with a crack in the side from top to bottom an inch wide extending across the tun free to wide extending across the top, free to rain or snow or ofher imclemences; and others under some shed with the top entirely off, and perhaps a foot or more from the ground, both ends open; more from the ground, both ends open; while others are out in some thicket or briar patch in some old box of about 4000 cubic inches, and so little attention has been given it, that the box is entirely rotten, only held together by the "cross sticks," and bees working out at every angle from it, "mother earth" having claimed 2 inches of the bottom of the gum, and yet these bees have occupied this position for 6 or 7 years without loss in wintering.

Bees are wintered in every conceiv-

Bees are wintered in every conceivable condition in this climate, except without plenty of honey, proving beyond a doubt of the most skeptical, that ventilation in this climate, is unimportant to winter bees successfully.

If we have a few weak colonies when winter approaches, they should be united with other weak colonies, or, if we wish to preserve the queens, contract the hives to a suitable size, and, with plenty of honey, they will go through the winter safely.

with plenty of honey, they will go through the winter safely.

It will be seen from the above and foregoing, that bees winter here almost without any attention, if they have plenty of pure honey; and right here we might add, that if our bees are put away with plenty of honey, and in comfortable hives, that all they need is a "severe letting alone" until the approach of the next honey season, unless we are satisfied that they are starving, when they should be fed pure honey on top of the frames with as little disturbance as possible. as little disturbance as possible.
Kingston, Texas.

### Spruce Honey Kegs.

JAMES HEDDON.

A majority of the years of my honey A majority of the years of my honey producing have been devoted to the production of extracted honey. I presume I have marketed more than 150 000 pounds. I have used dozens of different kinds and sizes of packages, different kinds and sizes of packages, from a 1 pound glass tumbler to a 1,000 pound cask. I have used mainly an oak 32 gallon barrel for selling in bulk, but that carries with it the same objection that larger boxes of comb honey do, viz.: Too large to suit many customers, or to carry safely and handle easily, and to pile up economically in our rooms.

in our rooms.

The 50 and 100 pound cheap spruce kegs just satisfy a long-felt want. They need a slight soaking with clean water, then drive and tack the hoops,

and they are as tight as a drum. I have always had the best success with wood hoops; they hold better than iron ones. These kegs are a blessed addition to our supply department, for which Mr. Alfred H. Newman is entitled to our thanks. With spruce kegs and spruce sections, do you not think we are becoming quite "spruce? Dowagiac, Mich., Sept. 15, 1881.

#### For the American Bee Journal. The Arrival of the Prize Queens.

E. L. BRIGGS.

No one but a bee-man can under-No one but a bee-man can understand the pleasing excitement of expecting, receiving, and disposing of a half dozen rival queens, as contestants for the highest honors, known to the royal sisterhood, of beauty, strength, gentleness of demeanor, and numerical increase and prosperity of subjects, over which she reigns a

queen.
Shortly after my proposition went forth to the public, I received and accepted the following queen breeders as contestants for the \$10.00 prize:

J. Osborn & Bros., of Le Claire,

William Lossing, Hokah, Houston Co., Minn. Charles H. Lake, 93 W. Pratt St.,

Baltimore, Md.
Dr. I. P. Wilson, Burlington, Iowa.
M. H. Snyder, of Elmwood, Ill.
Wm. P. Henderson, of Murfreesboro,

As an alternate, I also accepted, J. M. C. Taylor, of Louistown, Md., in case any one of the others failed to ar-

Of course it became my daily business to haunt the Post and Express offices, and no ten yirgins ever looked for the coming of the bridegroom with more solicitude, than I looked for the coming of the queens, upon every train. After what seemed weeks of coming of the queens, upon every train. After what seemed weeks of waiting, the express messenger put into my hands a 1-framed nucleus observing hive, from Dr. Wilson, of Burlington, Iowa, containing a full-sized Langstroth frame, with a queen, and her attendant escort of workers. and her attendant escort of workers. Litook her to the parlor table, and, in the presence of my wife and family, she was unveiled to our admiring gaze by lamp light. The next day the bees were set at liberty, and have been prosecuting their work with unviving goal ever since. The acceptance of the second seco been prosecuting their work with untiring zeal ever since. The queen herself was duly installed as the regal mistress of my colony No. 20, which has been filled with brood, now about ready to issue from their cells. A young queen, a complete duplicate of her mother, now reigns over the nucleus, which will tell the judges of the queen-breeding qualities of the

mother.

Next came a small red-painted nu-Next came a smart red-painted nucleus hive, containing 3 trames, and about a pint of bees as attendants of their queen mother, from Mr. Lossing, of Minnesota. She remains with her right-royal looking children, the nucleus having been enlarged from time to time till it is now almost large cieus having been enarged from time to time, till it is now almost large enough to winter in. A royal prin-cess has been reared from her brood also, that, in appearance, is fully up to the standard, and exactly like her mother.

Then came the queen of the south, from Mr. Win. P. Henderson, of Tennessee, contained in a queen-cage with from 25 to 50 workers as attendwith from 25 to 50 workers as attendants. I dare not, of course, speak of these queens in comparison with each other, until after the judges decide upon their relative merits; but, if all the daughters of Tennessee are as fair and gentle in appearance, and as regal in bearing as this beautiful queen, then the men of Tennessee are to be envied. This queen, after a day's probation, was installed as ruler of colony No. 16, where she still presides right No. 16, where she still presides right royally.

On the 27th, a nucleus hive containing another trancendantally beautiful queen and her escort, arrived from R. J. Osborn & Bro., of Le Claire, Iowa. She was without any probation gladly welcomed, and installed over colony

No. 37, where a young unfertilized on candy; it carried them through queen had been destroyed. When the attendant workers began to move on to the comb, the tenants of 37 met. One writer in the BEE JOURNAL, attendant workers began to move on to the comb, the tenants of 37 met them with a buzz of gladness, and stretched out their bills to feed their approaching visitors. So the queen was permitted to move on in the procession .oo. She was fed and caressed from the start. She commenced de-positing eggs at once, and her progeny will be on time for the coming exhibi-

On the 7th, a nucleus containing queen and bees on 3 frames, arrived from M. 11. Snyder, of Elimwood, Ill. from M. H. Snyder, of Elmwood, Ill. The accompanying bees are exceedingly large, and seem bent on making up for all lost time, by filling their uncleus with honey. They are a dark leather color. The brood of the queen is issuing quite rapidly, and of course will show her breeding qualities by the time the day arrives. The queen is very large, brightly colored and beautiful, and pays no attention on being handled, pursuing her business as though the comb remained in the hive.

hive.

Take it all in, they are as fine a collection of queens as I ever saw; one, of which is at least from an  $\frac{1}{6}$  to a  $\frac{1}{4}$ larger than any yet having come under my observation. What her progeny may be, in this respect, time alone will determine.

From some reason or other, the one from Bultimore has not arrived yet, neither has the alternate from Mr. Taylor. Therefore, if any other queenbreeder wishes to compete for the prize, and will forward a nucleus hive at his own risk containing a queen accompanied with a sufficient number of bees of her own progeny (and none others), I will put her in, provided the others do not arrive, and either pay for ber, or return her in as good order as received, at the express office, provided the others do come. However, if no other comes, one of the live will be awarded the \$10.00 prize, in addition to the sale price, and I shall be abundantly satisfied with the result of the enterprise.

Wilton Junction, Iowa.

For the American Bee Journal.

### The Wintering of Bees.

E. ROOD.

Were I younger. I would try a very simple experiment in wintering, to wit: As soon as the first killing frost, I would extract all the honey, then select sufficient combs to contain symp made of pure cane sugar and water (say 2 lbs. of sugar and 17 ounces of water), simmer them together for a few moments, skim, and feed 25 lbs, to each colony, by some of the variety of feeders, into combs having no pollen. This should surely be done in pollen. This should surely be uone in season for the bees to cap it over. Thus the experiment covers two

points:
Bacteria (or poisoned honey in some other way), and the evil effects of pollen if any; rye meal may, and should be substituted for it in the spring. This done, all causes for dysentery seem to be guarded against, except one: Epizootic, or local atmospheric influence, like Asiatic cholera with the human race, or epizooty with horses.

By the above experiment, the three pounds of extracted honey will bring as much as the sugar will cost, and

I know of no one that has said that bees will winter on candy. Mr. Langstroth has not; but they will do well on it when they can fly often. I tried a good colony 2 years since, by placing only empty combs in the hive. placing only empty combs in the hive, on Nov. 1, and gave the bees pure cane sugar candy on the frames; the moisture from their breath softened it. While they could fly every day they did well, and they seemed to prefer the candy. But December was cold every day, and they all gorged themselves to death within 30 days.

says his bees dwindled badly in the says his bees dwindled natity in the cellar in the spring, as I have not a particle of doubt all have if the cellar is warm. The living drag out the dead, tumble them to the floor together, and how does the living one final it, was to be, hive again? Mr. find its way to her hive again? Mr. Kelley, of Wayne, Mich., devised a perfect remedy by tacking to the bottom board a small boy, so smooth inside that a bee cannot carry her dead sister up; and they will tumble into the box; she will drag the dead one around, when it finds that it cannot succeed in earrying it up the side of the smooth box, it will abandon the attempt, and ourse seek her home and find it. Wayne, Mich.

#### For the American Bee Journal. Parthenogenesis Again.

PROF. A. J. COOK.

1 have been repeatedly asked, and I have been repeatedly asked, and even urged to reply to the article b. Mr. C. J. Robinson, in America's Bee Journal for Aug. 21th, on parthenogenesis. My time has been so occupied that I have not been able to get a moment for this purpose till get a moment for this purpose. get a moment for this purpose till now; and even now, 1 must be very brief, which I can the better afford to be, because of the able and excellent article from Wm. R. Howard, M. D., (AMERICAN BEE JOURNAL vol. 17, p. 290), just at hand.

First let me say, that in stating that all intelligent apparists accented purpose.

all intelligent apiarists accepted par-thenogenesis, I by no means meant to be discourteous, or harsh, truth is too glorious a thing to wrangle about; life is too short, too full of golden op portunity for good work, to admit of any time for harsh words or unkind allusions. The article which I wrote was prepared and read before the Entomological section of the American Association, for the advaucement of science one year before it appeared in the American Bee Journal, therefore I did not then know of Mr. Robinson's views. Major Munn was in his dotage when parthenogenesis was first brought to the attention of scientists, and died some years ago, (1 think now that without doubt, he is a believer in agamic reproduction). Yet even if a few do fail to accept the theory, these exceptions but prove the rule, and we might still say that parthenogenesis is accepted by all intelligent apparists.

Mr. Robinson asks for proofs; I will give them:

1st. As well shown by Dr. Howard. 18t. As well shown by 1n. Howard, this phenomenon is not confined to bees, or even to insects. If Mr. Robinson will isolate plant lice just as hev come from the parent lonse (they are brought forth alive, being ovo viviparous) or he may carefully dissect the parent and take out the young lice, he will find that each one will produce he will find that each one will produce he will find that each one will produce lice when full grown, though it has never seen another louse male or fe-male, since its birth. Von Siebold has fully shown that many if not all, aculeate Hymenoptera, such as bees and wasps, males are the result of agamic reproduction. This then in case of bees is not exceptional, but an illustration of a law wide extended

among the lower animals.

2d. Isolate a queen or prevent her from pairing by elipping her wing, and she will certainly lay none but drone eggs. Examine with the microscope and we find no sperm cells in her symmathetic are widnets. In all her spermatheca or oviduets. In all drone-laying queens the spermatheca is likewise depleted. The same is true of fertile workers. This of itself is a demonstration of the truth that

drones result from parthenogenesis, 3d. The eggs in queen and worker cells contain the spermatozoa or male they did well, and they seemed to prefer the eardy. But December was cold every day, and they all gorged themselves to death within 30 days.

Fifteen colonies that were short of honey, one spring, after removing them from the cellar, I fed for I month

lepsch, who at first stoutly resisted this view, in opposition to Dzierzon, have upon thorough research, such ave upon thorough research, such research too as the Germans make, keen, close, untiving, have accepted this law, only as the loved truth and found it here?

Mr. Robinson in his article in the Mr. Robinson in his article in the BEE JOURNAL, vol. 17 page 89, carries the idea that some think that queens are the result of parthenogenesis. The queens can only come from eggs which have received the sperm cells, and after the eggs hatch the food must be richer (a fact of which I am persuaded), and more abundant. He says Dzierzon "jumped at his theory." I do not so understand the matter. Dzierzon pronounced this law not as Dzierzon pronounced this law not as in hypothesis, but as a truth demonstrated by practical observation, and sustained by two of the most able scientists of the world—Von Siebold

and Leuckart.

The theory of Mr. Kirby, as given by Mr. R binson, it seems to me is

-ntirely untenable.

Ist. It has no purallel, so far as I know. Elsewhere in the animal kinglom, sperm cells are always the product of male organs, and can only be ffective when they come in contact, in a fresh state with fresh eggs.

in a fresh state with fresh eggs.

2d. I have repeatedly examined
royal jelly with a high-power microscope, and could not have failed to
notice the sperm cells if they were
there. There were none. That the
semen could be deposited and used at
pleasure by the workers is impossible.
It is well known that sperm cells are
only vital when convergitively fresh

only vital when comparatively fresh.
It occurs to me that Mr. Robinson can test this matter easily for himself. Early next spring let him take frames of empty comb one of which shall be placed in a hive with a queen-no drones of course-just long enough to drones of course—just long enough to secure some eggs; with these let him make a nucleus. He may feed sugar for food—the bees will gather pollen enough for the few larvæ, and I will warrant him a queen. Yet, on his theory, where are the sperm cells. I will tell him: They were incorporated in the egg as it passed the spermatheca of the queen.

In answer to Mr. Robinson's last question, I would say that had he reared as many insects as I have and

reared as many insects as I have, and reared as many insects as I have, and noted the wondrons effect on the imago of partial starvation of the larve, after a reduction in size of at least one-half, with parts illy developed, and then remember as Darwin has so graphically shown, that in all animals the reproductive organs are, of all the tissues, the most sensitive, we may easily believe that more or less food, of richer or less rich quality, might readily accelerate or retard the development of the ovaries of worker larve. I find that these rudimentary organs do vary in difrudimentary organs do vary in different workers.

I have shown that Syrian bees have afforded a proof of parthenogenesis. The points will be given in a paper to be read at the National Convention. Lansing, Mich., Sept. 18, 1881.

For the American Bee Journal,

### The Degeneration of Bees.

GREINER BROS.

In order that we may have the above subject a little more investigated, we wish to ask Mr. S. S. Butler his opinion on one or two questions. From the related instance of the S weather-beaten pine boxes, Mr. B. draws the conclusion that that kind of bee-habitation, being let alone, is better adapted for successful beekceping than the movable frame hive with its various manipulations. He keeping than the movable frame hive with its various manipulations. He says, "I claim that his bees had not lost any of their natural vigor or toughness, had not degenerated by either rearing forced queens himself, or being near enough to one who has," etc.

We refer the gentleman to the statistical table on page 228 of the American Bee Journal, and ask the question: Why is it then, that the

Would such an expert scientist and able apiarist as the late Baron of Berter of 89 per cent., whilst the Laugter of 89 per cent., whilst the Lang-stroth hive, which is used, perhaps, as much as any other hive for artificial swarming, and forced queen-rearing, has suffered the least, only 43 per cent.

For the last 6 years we have made bee-keeping our exclusive business, and within a radius of 15 or 20 miles, we are the only ones that have practiced artificial swarming and forced queen-rearing. Why is it now, that queen-rearing. Why is it now, that that our loss last winter was less than one-half of our bees, being 75, of 160 colonies, while our neighbors, as far as we could learn, have lost from 75 to 100 per cent., box hives not excepted.
There seems to be a little misunder-

There seems to be a little misunder-standing in the term, "forced queen rearing." We have no doubt that queen-rearing, if practiced as de-scribed by Mr. Butler, would result in degneration. He says, "The queen-less part rears one from larva, from I to 3 days old, making a queen not up to the standard of one reared by nat-ural swarming." This may be true, but the queenless part should be sup-plied with a laying queen when the

plied with a laying queen when the division is made, or else the main object of artificial swarming is missed.

The queen should not be reared from a larva 3 days old, nor by a divided swarm, but should be reared from the care of a selected mother and by the egg of a selected mother, and by the best colony in the apiary. Queens the best colony in the apiary. Queens reared in this way have answered our purpose first rate; some bee-keepers may prefer those reared by the swarming impulse, but when we compare our last winter's loss with the loss of apiaries—where the latter plan has been practiced; when we observe that our best colony has given us the enormous yield of nearly 400 lbs. of comb honey in 2 lb. sections, and that the average yield of one of our branch apiaries is 135 lbs. per colony, we can well afford to rear our queens by the forced system, and recommend it as safe and harmless.

Naples, N. Y.

For the American Bee Journal.

### Preparing Bees for Winter.

L. J. DIEHL.

Mr. H. Rickey, asks in reference to my article on page 208 of the BEE JOURNAL, of Aug. 24, "Does Mr. Diehl leave the hole near the entrance

Diehl leave the hole near the entrance open all winter, or what is it for? Does he contract the entrance?"

In reply, I will say that I leave the auger hole open, and I have found that it answers two purposes: First, there is circulation of air enough to keep the hive pure and sweet, and yet not enough to cause a draft in the hive, and cause over consumption of honey. I advised that all colonies should

I advised that all colonies should face the south; this is very essential safe wintering with my method. All combs should run from from to rear, combs should run from from to rear, then if the hive faces the south, and is not shaded too much, the morning sm in winter will strike the hive and the combs, and will conduct the heat to the bees. The hole in front will come opposite the cluster of bees, and they will take advantage of a few hours' sunshine to void the feces when the lower entrance is frozen in and the lower entrance is frozen up, and otherwise closed.

1 contract the entrance to about  $1_{1_2}x1_4$  of an inch, thus preventing a draft. The auger hole being  $4_2$  inches from the top of the hive, there is no upward ventilation.

upward ventilation.

In this way I have wintered with success for the last 6 or 7 successive winters. In this county there was scarcely any bees that lived through the winter, with the exception of mine, and my loss was 6 out of 80 colonies. My bees have increased to 197 onies. My bees have increased to 135, mostly by natural swarming, and they mostly by matural swarming, and they are in splendid condition for winter. I have taken 2,500 lbs. of honey, mostly in 2 lb. sections, and have reared 125 queens. This has been a good season for bees, but I have been so busy in the store that I could not be a contraction of the store that I could not be a contraction to the should be a small district the store that I could not be a should be a small district the store that I could not be a should be a small district the store that I could not be a small district the store that I could not be a small district the store that I could not be a small district the store that I could not be a small district that I could not b give them the attention they should

have. Butler, Ind.

### Bees and Honey.

By particular request, the editor of the BEE JOURNAL gave a lecture at the Court House, in St. Joseph, Mo., under the auspices of the St Joseph Exposition, on the above subject, on Thursday, Sept. 8,1881. The St. Joseph Herald gives the following report of the lecture:

Mr. Thos. G. Newman, editor of the American Bee Journal, of Chicago, delivered a very interesting lecture to an appreciative audience, last night, at the Court House. Mr. Newman is an appreciative audience, list light, at the Court House. Mr. Newman is a very pleasing speaker, and when talking about bees, he is at his best. There was present at the lecture a number of prominent gentlemen of the city, Mayor Piner presiding over the preciping and introducing the

the city, Mayor Piner presiding over the meeting, and introducing the speaker. We give the following synopsis of Mr. Newman's lecture:

Mr. Newman said that the magnitude of the industry of "bees and honey" could be estimated by the fact that there were in North America 300.000 persons who keep bees, and if these apiaries average but 10 colonies each, the number of colonies reaches 3 000.000, and if these produce but each, the number of colonies reaches 3,000,000, and if these produce but the very small average of 25 pounds of honey per colony, then the product is 75,000,000 of pounds of honey, worth 10,000,000 of dollars; and if each colony of bees yields but I pound of bees wax yearly, then the wax product at 20 cts. per lb. is worth \$500,000.

The lecturer then reviewed at length the rise and progress of apiculture from ancient Bible times to the pres-ent, showing the several "progressive steps" in the science, and illustrated his lecture by a full description of the most useful implements of modern bee-keeping, many of which he exhib ited to the audience and explained

their uses.

He detailed the efforts put forth to obtain superior races of bees, and was very emphatic in his assertions that the credit belonged to America for obtaining, by careful selection and improvements, the best strains of Italian bees in the world, saying that he had taken some of these superior bees from his apiary in Chicago to the most prominent European countries, including Italy (the home of the Italian bee), and that these bees were universally universally trained to the property of the Italian been and the property of the Italian been and the Italian been are the property of the Italian been are the Italian b sally praised for their singular beauty. sally praised for their singular beauty, size, docility, etc., and that since he returned to America the Italian bee paper, L'Apicoltore, published at Milan, Italy, has thus said: "The American bred Italian bees exhibited to us by Signor T. G. Newman, editor of the AMERICAN BEE JOURNAL, on his recent visit to Italy, were the pretiest bees we ever saw." bees we ever saw.

bees we ever saw."

He said that five points were essential to entitle bees to the admiration of bee-keepers, viz: They must be prolific, industrious, doctle, hardy and beautiful in appearance. The queen must be able to keep the hive full of bees to gather the honey harment which it comes (and it is on ite of vest when it comes (and it is quite of-ten of short duration); the bees must be industrious, to let nothing escape their vigorous search while gathering the sweet nectar; they must be docile to allow the apiarist to manipulate them with ease and pleasure; they must be strong and hardy to withstand the rapid changes in climate; and they must be of singular beauty to attract the admiration of the fancier of fine stock. He said his ideal bee would be present at the very moment when the slumbering flower awoke to conscious ness, and unfolded its buds to take in the first rays of the morning sun, and dip into that tiny fountain which will dip into that tiny fountain which distils the honey drop by drop, and bear away its sweet nectar to its waxen cells of beautiful comb.

He said that while he did not know what may be the color, markings or

all of the special features of "the coming bee," he was certain that it would gather the most honey, be the most docile, hardy and industrious, and that its name will be "Apis

Americana."

From the fact that by the advance civilization, many of the honey-producing trees, plants and shrubs were disappearing; the lecturer argued at some length the necessity of planting for the honey bees just as much as for any farm stock—in order to secure a succession of bloom from spring to

The speaker said that not withstand ing the many improvements that had ing the many improvements that had been made in apiculture, it was but yet in its infancy—that the flora now going to waste in America could, if properly gathered by bees, produce a revenue of 200,000,000 of dollars annu-

The lecturer then entered into tail about the wonders of the bee hive and its industrious little insects. He described the development of the queen, drones and workers, and gave the audience an insight into the wonderful enonomy of the hive. He said he had seen the seven wonders of the he had seen the seven wonders of the world, but the wondrous little bee, with its architectural skill, governmental wisdom, untiring activity, and marvelous transformations, was really the Aaron's rod that, swallowed up all the other wonders—many of which he detailed at considerable length.

Some were fearful of an over-production of honey, but the speaker said that there was already a demand far in excess of the supply. Just before leaving Chicago to come to St. Joseph reaving Chicago to come to St. Joseph to deliver this lecture, he had received a letter from England asking him to send 250 tons of comb honey, and the purchaser stood ready with cash in hand to take it at three times the price it must be brice. it would bring in America. The reason for this foreign demand was obvious. Europeans had neither the honey-producing flowers, favorable seasons, nor the improved appliances to gather the honey at home, and hence must depend on America to

hence must depend on America to supply them.

Mr. Newman closed his lecture, which had been interrupted by frequent and prolonged applause, by saying that he had read with much pleasure the article in the St. Joseph Herald of last Sunday, entitled, "Beesand Honey," and was amused at the sagacity of the reporter as well as the philosophy of Mr. A. M. Saxton, one of the prominent citizens of St. Joseph, who had been interviewed. Mr. Saxton was right in saying that the inhabitants of St. Joseph and its vicinity should be benefited by the display of honey and bees at the Exposition, and the speaker said he was glad to see that Mr. Saxton had offered special premiums of \$40 for honey exhibiting the speaker of the special premiums of \$40 for honey exhibiting the speaker said in the speaker said in the speaker said in the speaker said he was glad to see that Mr. Saxton had offered special premiums of \$40 for honey exhibiting the speaker said in the speaker sa see that Mr. Saxton had offered special premiums of \$40 for honey exhibited by ladies. Many ladies were already engaged in the industry, and were among the most successful, nature having endowed them with fixed ture having endowed them with finer feelings, and as close a scrutiny and activity as it had man. The speaker said that to the untiring energy of Mr. R. S. Musser, the credit was due for making the bee and honey show so much of a success. It had really been one of the chief attractions of the Exposition, many having come from 50 to 100 miles to see it alone. He most emphatically endorsed the following sentiment, quoted by Mr. Saxton:

"Work for some good, be it ever so slowly Cherisb some flower, be it ever so lowly, Labor!—all labor is noble and holy.

Success in any industry depended upon information, study, activity, adaptation and skill, and anyone who possessed these essential qualities, and was willing to learn, could make a success of bee-keeping. Those who would not study and learn from the experience of others how to care for bees, should keep out of the business entirely.

In conclusion, the speaker detailed some of the principal qualities of honey, both as food and medicine, and

Chicago, for his lecture. Mr. Newman is not only the editor and pubman is not only the editor and publisher of the American Bee Journal the first weekly bee paper in the world), but is the author and publisher of several works on the subject of scientific bee-keeping and honcy produc-

Bee and Honey Show at Manchester, England.—The London Horticultural Journal gives the following account of

The Committee of Management arranged to have no competition in the grew, of Bowdon, to provide an attractive and interesting display of bees and honey from his own garden. The consented to do so, believing that an exhibition of this kind would go far to popularize bee-keeping. Mr. far to popularize bee-keeping. Mr. Pettigrew resolved to make this show a novel one, by introducing a new form of observatory hives, and to exhibit legends on black boards done in honey comb by bees, and sets of icicles honey comb by bees, and sets of incides of honeycomb under glass shades. The state of his health prevented him from doing all he intended and desired to do. The icicles were not done. However, the exhibition was evidently a great success. The honey tent was crowded with visitors every day, and no one could enter it without honeing expressions of wonder and and no one count enter it without hearing expressions of wonder and gratification from all classes of visi-tors. The observatory hives, 4 in num-ber, were of cheap and simple con-struction, with bees and glass on one side only of each super. The queen of side only of each super. The queen of each super had a white woolly cotton thread tied round her waist, which enabled the spectators to see her at a glance, and watch her movements as she wandered amongst the communications. ity. But the most conspicuous and novel exhibits of the bee tent were two black boards 6 feet 4 inches long, and 2 feet broad, with two legends on them done in honeycomb—viz: "God Save the Queen," and "Industrial Exhibition." The letters being 5 Save the Queen, "and "Industrial Exhibition." The letters being 5 mches long or thereabouts were easily read, and seemed to delight all classes of visitors. Both boards were labelled "Our First Efforts in A B C." Honey of different kinds and of the highest quality in glass dishes were on the tables, beside bone spoons, for visitors to taste; and honey in glass bottles—4 lbs in each—was there for sale. The demand for run honey was extra-The demand for run honey was extra-The demand for run noncy was ordinary, and all was speedily sold at the fallout 30 ets). Three 1s. 4d. per lb. (about 30 cts). Three bottles of crude honey were on the tables for the purpose of showing, in the exhibitor's opinion, that honey proper and it for use on the breakfast table is not found in find. table is not found in field or forest, but is made by bees at home from the crude materials found in flowers.

The time selected by the Executional Convention, at Lexington, Ky., is October 5, 6 and 7, 1881. All beebeepers are invited to attend and take tight in the Jalikomtian of the Convention part in the deliberations of the Convention. As Lexington is a central point, the Executive Committee hope point, the Executive Committee hope to have a large attendance from the North, South, East and West, and from Canada, and that the 12th annual meeting of the North American Bee-Keepers' Society will be the most in-teresting meeting that the bee-keepers of the United States have ever held. N. P. Allen, Pres.

Kentucky Bee-Keepers' Association.

The second annual convention of the Kentucky State Bee-Keepers' Association, will be held in the Exposi-tion Building, in Louisville, Ky., on Wednesday and Thursday, Oct. 12

A fine display of bee-keepers' sup plies, honey, etc., is expected, and some of the most prominent bee-keephoney, both as food and medicine, and and then took his seat amid much applause.

A vote of thanks was unanimously given to the Hon. T. G. Newman, of

The Northwestern Bee-Keepers' Association will meet in Chicago, on Tuesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. MILLER, M. D., Pres. C. C. COFFINBERRY, Sec.

The Western Michigan Bee-Keepers' Association will meet in Berlin, Oltawa, Co., Mich., Thursday, Oct. 27, 1881, in Huntley's Hall, at 10:30 a.m. All interested, are cordi-Oct. 27, 1881, in Trimiley's train, at 10:30 a.m. All interested, are cordi-ally invited. WM. M. S. Dodge, Sec. Coopersville, Mich., Aug. 29, 1881.

The Northern Michigan Bee-\*\* The Northern Michigan Beereepers' Association will hold its fourth Annual Convention at Maple Rapids, Clinton Co., Mich., Oct. 11 and 12, 1881. O. R. Goodno. Sec.

Bee-Keepers' Union.—The Eastern New York Bee-Keepers' Union Asso-ciation, will hold their eighth semiannual Convention on Tuesday, Sept. 27, 1881, at 10 a. m., at Knowersville, N. Y. All bee-keepers are invited to attend. W. D. Wright, Pres. N. D. West, Sec.

The South Eastern Mich. Bee-Keepers' Association, will hold its 4th meeting at the Court House, in Ann Arbor, Wednesday, Oct. 5, 1881, at 9 o'clock a. m.: the week of the County Fair. An adjourned meeting may be held during the week. All interested are invited to attend. By order of the Executive Committee.

N. A. PRUDDEN, Chairman.

N. A. PRUDDEN, Chairman.

The North Eastern Wis. Keepers Association, will hold its fall meeting at Peewankee, Wis., on Tuesday and Wednesday, Oct. 11 and 12. A full attendance is cordially requested. Notice of the plance of meeting will be found at the local Past Office. Post Office.

GEO. CHURCH, Pres., Neenah, Wis. Frances Dunham, Sec., Depere, Wis.

South Western Iowa Bee Association.—The regular annual meeting of this association, will occur at the apiary of James T. Fife, in Jasper township, near Corning, Iowa, on Thursday afternoon, Sept. 29. The place of meeting is such that the topics considered will be practically demonstrated. Following is the programme: Business of Society; raising of queens; introduction of queens; dividing of bees practical handling of bees. A full attendance is desired. onth Western Iowa Bee Association. practical handing ... tendance is desired.

J. T. Fife, Pres.

W. J. OLIVER, Sec.

The Eastern Michigan bee-keepers'Association will hold its fall meeting in Detroit, Oct. 4, in the Y. M. C. A. hall, at 10 o'clock a. m.
A. B. WEED, Sec.

Owing to the fact that the time of the regular meeting of the Union Bee Association, at Shelbyville, Ky., conflicts with the time fixed by the executive committee, to hold the Na-tional at Lexington, the meeting of the Union, at Shelbyville, has been postponed till the 20th of October.
G. W. Demarke. Scc.
Christiansburg, Ky., Sept. 3, 1881.

The Rock River Valley Bee-Keepers' Convention, will be held at Monroe Center, on the third Tuesday in October. We hope a good atten-dance will be the outcome, and the bee interest revived.

D. A. CIPPERLY, Sec.

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Wis., Nov. 30, 1881.

N. E. France, Sec., Platteville, Wis.

and 13, 1881.

Amount of Honey Needed for Winter. Amount of Honey Accord for Winter,

—I have 6 colonies—3 are Italians and
3 are hybrids. The Italians done a
great deal the best. Please answer:
How many lbs. of honey are plenty
for a colony to winter on in the cellar,
and how much on the summer stand; CHAS. A. PONTIUS. Canton, O., Sept. S, 1881.

[For an ordinary winter, in the cellar, 20 to 25 pounds should be sufficient; on the summer stand, 25 to 30 pounds. In either case, 5 pounds more is better. —ED.1

California Honey Crop.—In the BEE JOURNAL of Ang. 24 (just at hand), you quote from the San Francisco Examiner, the information that southern California will have an average crop of honey this year. This is not so; as not one in ten of the bee-men will have a pound of surplus. We were very fortunate in securing about 000 the from 140 colonies but will 900 lbs. from 140 colonies, but will have to feed this winter. HOLMES & SCOTT.

Los Angeles, Cal., Aug. 30, 1881.

Maine Items.—Inclosed find speci-men of plant which the bees work on men of plant which the bees work on early and late. It grows in my bee-yard with the spider plant and Simp-son honey plant. Although in full bloom, I have seen no bees on either of them, but plenty of hornets on both. What is the matter with the highly extolled spider and honey plants? There is doubtless honey in them; I have seen the drop of honey in the spider plant, and as the wasps are on the other, there must be honey in it. I would like the name of the seecimen I send. We started a bee-keepers association—the first in Maine—called the Northeastern Bee Association. The yearly meeting is held the second Tuesday in February. We have held three quarterly sessions, which were here this seasons, with were very interesting. Bees have done well here this season. I started work last spring with 26 colonies, run them for honey all 1 could, have had 10 natural and 4 artificial swarms. My bees are mostly blacks—having 3 Cyprian and 2 Italian queens. I shall have about 1,000 pounds. LUCIAN FRENCH. Sangerville, Maine, Sept. 3, 1881.

[Mr. French sends an aster. 1 snppose the reason that the bees did not visit the figwort and spider plant was that they found something they liked The bees worked well on our better. Rocky Mountain bee plant until fall bloom, when they left it altogether .-A. J. Cook.]

Great Trotting Week at Lexington.—Believing, as I do, that many beekeepers are interested in the best strains of horses, as well as bees, I take pleasure in announcing through the BEE JOURNAL that the Fall Trotting Page 200 pages 200 pa the BEE JOURNAL that the Fall Trot-ting Races commence here on Tues-day, Oct. 4, and continue four days, so that those who attend the North Amer-ican Bee-Keepers' Convention, and desire to see the best strains of Ken-tucky horses trotting on their "native heath," will have an opportunity to do so. The prospects for a large and en-thusiastic attendance at the National Convention are very flattering. The following are among the most promifollowing are among the most prominent from a distance who have signified their intention to be present: D. A. Jones, of Camada, the "Bee King of the Islands," I might dub him; Dr. J. P. H. Brown and lady, of Augusta, Ga.; Mrs. Frances Dunham, of Wisconsin; C. C. Coffinberry, of Chicago, Ill.; Chas. F. Muth, of Cincinnati. O.; and Mrs. L. Harrison, Peoria, Ill. I should be pleased to hear from others.

W. WILLIAMSON,

Vice President for Kentucky.

Lexington, Ky.

Lexington, Ky.

Autumn Honey.—The present exceptionally dry season, in strong contrast to the very wet season a year ago, shows clearly that a dry season is far less detrimental to the apiarist, than a wet one. Last year we got very little honey, while this year we have a large yield of beautiful autumn honey. We have increased from 5 to honey. We have increased from 5 to 12, and shall get from 500 to 600 lbs. of honey.

A. J. COOK.
Lansing, Mich., Sept. 10, 1881.

Well Sold .- I have just sold a part of our crop of honey at 22 cts., put up in our patent caps. I have sold to the same party for the last 3 years.

J. E. Moore.

Byron, N. Y., Sept. 10, 1881.

[That is a good sale. It is always desirable to keep, as well as to get customers. It is so much mere pleasant to deal with those we know and have had experience with.-ED.]

Those Italian Bees in Australia. 1 have transferred the 2 colonies of Italians received from Mr. A. H. Newman, of Chicago, on July 2d. I found in both hives the combs in the center frames had been forced sidewise from their original frames, in such a manner as to lead to the frame adjoining being attached to the comb intended for its neighbor. I transferred them without separation, and without the on table of robbing. The number of bees in each colony is small. They my briskly every day, a few returning with pollen. It seems to me that the damage to the combs must have occurred on the improvement. enried on the journey by rail from Chicago to San Francisco, when they must have been exposed to more rough usage than on the sea voyage. I cannot but think that it would have been an improvement, if the combs had been secured to the frames by wire or other fasteners. S. MACDONNELL. Sydney, Australia, Aug. 8, 1881.

I We are informed the weather was excessively hot when the bees were shipped from Chicago, and presume the combs softened before reaching San Francisco. Of course the colonies were depleted of all the field-workers possible before shipping, and if they reached their distant destination with bees enough to cover three frames each, they done remarkably well. As they were bringing in pollen on the 8th ult. (which is pretty positive proof that they have commenced breeding), they will now soon breed up. We think wooden binders much better for fastening in combs for shipping than the wires, for various reasons.—Ep.]

Drone Eggs from Young Queens. A. B. McLavy, page 292 of the BEE Journal for Sept. 14, I would say that doubt and for sept. 14, I would say that the young queens often lay drone eggs even in worker cells for the first few days of their laying. They do not have ready control of the muscles which control the spermatheca, and so the required sperm cells are not forced on the law area. to the eggs. Young birds and insects often have to try awhile before the muscles of flight will work, so this lack of power in the young queen is not anomalous.

A. J. Cook. Lansing, Mich.

Better than Expected.—When I last wrote you (in August), the probabilities were that I would have to feed my bees; but since then the honey yield has been better. I will now secure from my Italians about an average of 30 lbs of comb honey from each age of 30 lbs. of comb honey from each stand, and will leave the bees very strong for winter. My 1 colony of black bees finally died. They were

not worth their trouble.

DAVID HIGBEE.

Avoca, Iowa, Sept. 14, 1881.

Light Basswood Yield .- I had 45 colonies of bees in the best condition of any I ever had during basswood bloom, vet I only obtained about one barrel of basswood honey; it rained continuously. I have but 1,200 lbs. for the season's work.

JAS. E. CADY.

Medford, Minn., Sept. 8, 1881.

Another of H. A. Burch's Customers. —I am one of the unfortunate ones in the II. A. Burch & Co. swindle. As were highly recommended by Jas. Heddon, I supposed them to be all right, and sent them \$5.75 for 6 queens on April 25th, queens to be shipped on or before June 20th, or the money to be returned. I do not receive either be returned. I do not receive either money or answer to my letters. Would it not be best, for all who wish, to join in a lawsuit against said firm, get a judgment, then keep an officer to watch them, and as fast as anything shows itself to fasten upon it and sell it the autofrensch indement? It strikes snows usen to faster upon it and sen it to satisfy such judgment? It strikes me he would rather settle up than have a judgment of this sort, with contingent expenses, over his head.

JAS. E. CADY. Medford, Minn., Sept. 8, 1881.

[The above letter does serious injustice to Mr. Heddon, who, as we understand the matter, never endorsed II. A. Burch & Co., nor their method of transacting business, but did compliment them on some bees which he purchased from them, and gave them permission to use his name that far only, We fail to see any good that can be derived from bringing suit and obtaining judgment, if II. A. Burch & Co. have nothing subject to execution, as the costs of suit would have to be advanced by the creditors, thus "throwing good money after the bad." If. instead of being unfortunate, this firm have been preparing to defraud their customers, then of course they took precautions to secure their property against execution, and the fact of their referring their victims to Mr. A. I. Root for payment would seem to indicate that Mr. Burch considers it cannot be collected from him by any legal process.—Ed.]

Bees Have Done Well.—My bees have done very well, considering the season. They have not gathered as much honey this year as they did last year, although those that did not swarm did well. There is a general complaint of bees not gathering much honey all through this section of country. They swarmed too much to lay up much honey. Where white clover was plenty and close at hand, and where bees had proper care, they have done very well. Thos. Lashbrook. Waverly, Iowa, Sept 12, 1881. Bees Have Done Well.-

Bees and Honey in Georgia.—The interest in bee culture here is not what it ought to be, and what it would be if intelligently pursued. I have sold all my comb honey in I lb. packages this year, for 20 cts., and extracted at 15 cts., and it was spring honey at that, which is always dark. The bees are now storing honey from cotton bloom and goldenrod, which makes the finest honey we get. It is this honey I expect to exhibit at our State fair. I am sowing largely of melilot this fall, and I hope to be able to give a favorable report from the experiment, when it begins to yield honey. If we can only get something that will be to us what white clover is to the northern and western honey producer, we should have the best country in the world for here and honey. Rees and Honey in Georgia. - The inwe should have the best country in the world for bees and honey. We do not know anything about the problem which so vexes the bee-keepers in the colder sections—wintering bees. I never lost a colony from winter trouble in a movable frame hive, as can feed, if necessary, any day of the year, and I always try to keep informed as to the condition of every colony. Your criticism on Mr. Root's F. CLARKE.]

proposition to make good losses from delinquent advertisers, is to the point. Of course publishers are expected to exercise proper caution, but there, I think the responsibility ends. I think that an honest man would scorn to accept from a publisher what another owed him. F. N. WILDER. Forsyth, Ga., Sept. 2, 1881.

Three Hundred Pounds from One Colony.—My bees have done well for me this season. I shall realize from one colony 300 pounds of comb honey, of a fine quality. My importing has been a very great benefit to me.

G. II. Adams.
North Nassau, N. Y., Sept. 10, 1881.

The Bee and Honey Show at Baltimere, Md.—My "old reliable" bee hive carried off the first premium; the society's gold medal. My "molded hive carried off the first premium; the society's gold medal. My "molded foundation." 1st premium, \$3.00; Bingham smoker, 1st do; best colory of bees (Italians), 1st do.; best collection of bees, 1st do.; best crate of honey, 1st do.; best lo lbs. of comb honey, 1st do.; best collection of honey, 1st do.; best display of honey and bees, 1st premium special. A clean victory. I turned loose 3 colonies on the grounds within 10 feet of horses, and in the midst of a crowd of 13 000 per-

in the midst of a crowd of 13,000 persons, and handled them, removing all the combs, showing them the queen, and without dress, smoke, or anything of any notion to quiet them; not a person reported stung.

Chas. II. Lake.
Baltimore, Md., Sept. 12, 1881.

Good Honey Crop.—We have 11,000 lbs. of honey (most all white), and an increase of 143 colonies from 156 in the spring. Crop is cut short on account of severe drouth. Geo. W. House. Fayetteville, N. Y., Sept. 12, 1881.

Cyprian Rees .- I will give a little of

Cyprian Rees.—I will give a little of my experience with Cyprian bees. I sent to a New York queen dealer last year, for one of the first queens which came from Cyprus, and the dealer said he sent me a choice one. I thought best to test her before breeding from her. Let after testing bear. thought best to test her before breeding from her. Lo! after testing her, I find her progeny to be the best fighters that I ever saw. If the Cyprians are all like mine, I would advise beckeepers to let them alone, or if they have them, to get rid of them as soon as possible. I am very glad that I did not let them mix with my Italians. I sent the queen back to the queen dealer to-day. He can do as he likes with her.

M. H. MILSTER.
Frohna, Mo., Sept. 13, 1881.

A Ton of Comb Honey from 35 Colo-A Ton of Comb lloney from 35 Colonies.—Last spring my bees were reduced to 35 colonies; they increased by natural swarming to 65; they have done very well this season. I have taken off about a ton of surplus honey in sections, and 6 pound boxes. The local demand for honey is good; it sells readily for 18 to 20 cents.

L. F. Biglow.
Brooklyn, Wis., Sept. 14, 1881.

Bees in New Jersey.—My bees have done very well this summer. Last fall I had 54 colonies, and by May 1, I had lost them all but 14. I increased to 37 by July 1. I only ran 1 hive for box honey, and that gave me 26 lbs. of comb honey, and 45 of extracted. I intend to let the rest have all they have gathered. We have had no rain since July 4, and everything is dying here. The bees to-day are gathering a little honey from golderrod. ering a little honey from goldenrod, and that will not last long if we do and that will not last long it we do not have rain shortly. Success to the Bee Journal.

Joseph W. Riker.

Mont Clair, N. J., Sept. 8, 1881.

Virgil's Bee Lore.—Virgil says in his Georgics, that the honey bee often

### Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the old as well as the new address.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Faded or Gray Hair gradually recovers its youthful color and lustre by the use of Parker's Hair Balsam, an elegant dressing, admired for its purity and rich perfume. 36w4t

There is More Strength restoring power in a 50 cent bottle of Parker's Ginger Tonic than in a bushel of malt or a gallon of milk. As an appetizer, blood purifier and kidney corrector, there is nothing like it, and invalids find it a wonderful invigorant for mind and body. See other column. 36w4t

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay. except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the Journal for a year free. It will pay to devote a few hours to the Beet Louent. the BEE JOURNAL.

Tt would save us much trouble. if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums:

For a Club of 2,—a copy of "Bees and Honey."
3,—an Emerson Binder for 18%2.
4,—Cook's (Bee) Manual, paper.
5,—a " cloth.
6,—Weekly Bee Jouroal for 1 year.

We have a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, 

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

Office of American Bee Journal, Monday, 10 a.m., Sept. 19, 1881.

The following are the latest quotations for honey and beeswax received up to this hour:

#### CHICAGO.

HONEY—The market is lively and prices steady, I have just purchased a car lo d of extracted at current prices.

We quote light comb honey, in single comb boxes, iswedth; in larger boxes 2c, less. Extracted

BEESWAX-Prime quality, 18021c. AL H. NEWMAN, 972 W. Madison St.

HONEY—The market is well supplied at present, but there is a jarge prospective demand.
We quote as follows: White comb, in small boxes, 156418c; dark, in small boxes, 126418c. Extracted, white, 106012c; dark, 76696.
BEESWAX.—Prine quality, 2246044c.
THORN & Co., 11 and 13 Devoe avenue.

CINCINNATI. CINCINNATI.

HONEY-Is in good demand here now.
I quote: Good comb honey, in sections, is worth
146016c, on arrival. Extracted, 7603c. on arrival.
BEESWAX.-186022c, on arrival. 1 have paid
25c, per lb. for choice lots.

C. F. MUTH.

### BOSTON.

HONEY,—Our honey trade has now fairly commenced, and we are selling quite freely. We find that one-pound combs are a very desirable package in our market, and a large quantity could be sold at 206222c., according to quality.

BEESWAX—Prime quality, 25c.

CROCKER & BLAKE, 57 Chatham Street.

#### CLEVELAND.

HONEY-Comb honey continues in good demand at 20c. for 1 ib. white and 19c. for 2 ib. sections. Extracted honey, 10g/12c. BEESWAX-186290c, A. C. KENDEL, 115 Optarlo Street.

#### BALTIMORE.

HONEY.—But little on the market, and prices are not quoted.

BEESWAX.—Southern, pure, 21@23c.; Western, pure, 22c.; grease wax, 12@13c.—Haltimore Market Journal.

#### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb. sections, 22@25c.-Indianapolis Stock Review.

#### SAN FRANCISCO.

HONEY.—Sales of choice comb, to arrive, have been effected at 20c. for small lots. It is doubtful if an order for a large lot of choice comb could be diled in this market. Choice extracted, in barrels, is quotable at 9691½c. We quote white comb, 16@20c.; dark to good, 10@14c. Extracted, choice to extra white, 9610½c.; dark and candied, 8c. BEESWAX—236925c. STEARNS & SMITH, 423 Front Street.

### ST. LOUIS.

HONEY.—Demand fair, New extracted, 7@9c. omb, 14@16c.
BEESWAX-Prime yellow sells at 20@21c.
R. C. GREER & Co., 117 N. Main Street.

### PHILADELPHIA.

HONEY.-The supply and demand are allke nominal.

BEESWAX - Best light 23@25c,-Philadelphia Merchants' Guide.

### CANADIAN FARMER. THE THE ONLY Agricultural Weekly

PUBLISHED IN THE

### Dominion of Canada.

This practical Journal is now in its Third Year, and meeting with immense success. The low price of its subscription (\$1.00 per year) in its new and improved form (16 pages (13,400)e, folded and pasted) makes it very popular. Its editors are all practical men. It is the Heat Advertising Wedium in Canada. Sample copies sent free to any widesers.

## POPULAR HONEY KEGS

Small Kegs for Honey.

These kegs answer the popular demand for honey in small packages, and when compared with large harrels holding from 300 to 500 los, each, they are fully as cheap and often cheaper. They need in waxing but should simply be thoroughly scalded with boiling water before using. The leakage so often occurring in the large hard-wood barrels can be entirely prevented by using the White Pine Kegs, Considering the cost and trouble of waxing, the loss of honey by leakage, and the case with which these kegs can be handled and shipped, with an actual saving in original cost, it must be apparent to all that they are the best. Prices:

160 lb. Kegs, ..65e

nai principles of describing, and furnishes the lacts and arguments to demonstrate them. 15c.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, givin, recipes for making Honey Cakes, Chockes, Paddings, Fonn, Wines, etc. and Honey as Mcclicine with many useful Recipes. It is intended for consomers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, Gc.; per dozen, 50c.

Wintering Hees. — This contains the Prize Essays on this sobject, read before the Centennial Bee-Kecpets Association. The Prize—\$25 in gold—was awarded to Prof Cooks Essay, which is here given in tull. Price, 10c.

The Hive I Vac—Being a description of the

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, Sc.

Extracted Honey; Harvesting, Handing and Marketing, - 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their aplary. This contains many useful hunts.—Price 15c.

lag and Marketing.—A 2-i-page pamphiet, by Ch. & C.P. Dudant, giving in detail the methods and manusement adopted in their apiary. This contains many useful hints.—Price 13c.

Princtical Hints to Ree-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the manusement of bees, Price, 13c.

Food Addifferation; What we cat and should not eat. This book should be in every family, and ought to create a sentiment against addiferation of tood products, and demand a hav to protect the consumer against the numerous health-destroying addifferations offered as food. 20 pages 5 dec.

Kendall's Horse Hook.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick hoses, and treats all disease in a plant and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Lopp's Easy Calentator.—These are handy tables for all kinds of merchandise and interest, it is really a lightning calculator, well-bound, with slate and pocket. Cloth, \$1.; Morocco, \$1.60.

Chicken Cholera, by A.J., Hill.—A treatlee on the cause, symptoms and care. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,020/930 Industinstral bacts, Calculations, Processes, Trade Secrets, Legal Heins, Busmers Forms, etc., of vast utility to every Mechanic, Farmer and Busliness Man Gives 200909 Roms for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksanths, Founders, Mine s, Metallurists, Assiyers, P umbers, Gas and steam Fitters, Bronzers, Gilders, Metal and Wood Workers of every kind,

Builders, Manufacturers and Mechanics, 200 Expendice, Metal and Wood Workers of every kind,

Builders, Manufacturers and Mechanics, 200 Expendity, Founders, Metally and Manufacture, Sentence, Sentence, Sentence, Sentence, Heining, Mill Machinery, Sagar, Onl, Markin, Threshing, and Rolumg Mill, do, Cotton Gas, Steam, Christian, Effects, Decordance, Sentence, Sentence, Secontics, Commission of Printers, Publis ers, and Writers for the Press,

DEVOTED TO SCIENTIFIC BEE-CULTURE AND THE PRODUCTION AND SALE OF PURE HONEY.

VOL. XVII.

### CHICAGO, ILL., SEPTEMBER 28, 1881.

No. 39.

Published every Wednesday, by

### THOMAS G. NEWMAN,

EDITOR AND PROPRIETOR.

974 WEST MADISON ST., CHICAGO, ILL.

#### TERMS OF SUBSCRIPTION:

WEEKLY-(52 numbers) \*2 a year, in advance. Three or Six Months at the same rate.

SEMI-MONTHLY—The first and third numbers of each month, at \$1.00 a year, in advance. MONTHLY—The first number of each month, at 50 cents a year, in advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

Remit by money-order, registered letter, express or hank draft on Chicago or New York, payable to our order. Such only are at our risk. Checks on local banks cost us 25 cents for collecting.

Free of postage in the United States or Canada. Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

### Are the Cyprians More Ferocious?

In view of the division of opinion which now prevaits regarding the disposition of the Cyprian bee, the following letter from Mr. A. T. Williams. St. Charles, Mo., will be read with deep interest. The writer is a practical bee-keeper of much experience, a shrewd, intelligent observer, perfectly honest and candid in his opinions, and his conclusions are certainly not influenced by prejudice or interestedness:

As a general report on the Cyprian bee seems to be in order, I will give my experience. I make bee-keeping a specialty, and rear but few queens for sale. I received a fine imported Cyprian queen from D. A. Jones early bet Santanbar representations. last September, reared about 40 queens from her, sold about 20, and the rest were introduced to full colonies.

They breed very late, and some of them continued breeding so late they

used up all their stores and starved; the past winter being so severe it was impossible to feed. I started last spring with 11 Cyprian colonies, including the imported queen. I had no other bees in my home apiary except Italians. My first swarm was from a other bees in my home apiary except Italians. My first swarm was from a colony containing a Cyprian queen. Of the 10 colonies, 8 swarmed before I obtained one from the Italians, although I had about 80 in the same yard. From the 10 Cyprian colonies I obtained more surplus honey than from 10 of the best Italians in the whole lat.

This year I have reared over 300 Cvbrian queens, and have at present about 200 in full colonies. The queens are more proline, are a great deal more more

young, unfertile ones, which often fly off the combs when lifted from the hive. The workers are lighter colored on the under side of the abdomen, have a much more nervous disposition, are very easily shaken off of the combs, but will not drop from the corners of the frames as the blacks do. They are very easily disturbed, and will re sent any jar of the hive; they will erawl out of the hive, and cannot be driven with smoke as the Italians, but with very careful handling they can be manipulated faster than the Italians, as the rapid motions do not seem to disturb them as it does the Italians.

l aimed to rear Italian drones to ferf almed to rear Italian grones to rertilize the queens, but I think I have had 25 or 30 fertilized with Cyprian drones. They are much crosser than the hybrids, and are not superior in any particular. Some of them are so cross there is no way to handle them; they cannot be induced to till them. they cannot be induced to fill themselves with honey, but when once aroused will run and fly out of the hives, are more rapid in their motions, will sting as no other bees except Egyptians can, will go long distances from their hives to enter buildings and attack, and they require a long time

to get quieted down. They are much ea are much easier to get in an abnormal condition; to deprive them of their queen all seem to realize their loss, and set to work to construct queen cells; will rear more queens, and they will average better than those reared by Italians. I believe the superior prolificness of the Cyprian queens is attributable to the extra care taken of the cybrian than the sells. I have for transferent the the cells. I have for years chosen the crossest colonies of bees I had to rear queens, and with the best results. I claim a very quiet, industrious colony of Italians will not build as many cells, and the young queens will not average

and the young queens winnot average as good as we can get from a nervous, excitable colony of hybrids. On this very point the Cyprians do excel.

I believe the Cyprians are destined to prove superior to the Italians in prolificness of queens, better to enter turning horse region to the factors. surplus boxes, easier to shake from sections and combs, and earlier to breed in spring. The only objection to them is their disposition. I am undecided at present whether I will continue to breed them as return to the decided at present whether I will continue to breed them or return to the Italians. If I should keep the Cyprians, I will try and have choice Italian drones to fertilize all my queens, and rear no Cyprian drones.

It will be seen that Mr. Williams fully corroborates the opinion expressed in the BEE JOURNAL of Aug. 10, page 252, regarding the disposition of the Cyprians, and this is also borne out by the testimony of others. It is easy to imagine that the queens of those who have found the bees so very gentle and tractable have mated with Italian drones, and thereby inherited that amiable disposition which will always make the better Italians a general favorite.

There is great unanimity in the tesnervous on the combs, especially the Cyprian stock with the Italian drones, cheerful as the years roll along.

They lose none of their vigor, they Extracting from Surplus Combs, etc. are easily removed from the combs, their industry is not diminished, and their beauty is unimpaired. The distinctive traits of the Syrian or Palestine bees are quite similar to those of the Cyprians, and so far as our observation extends, the result of the cross with the Italian drones is a decided improvement. How far it will be practicable to rear Italian drones for this purpose we are at a loss to determine; but imagine, in an apiary well stocked with Cyprian or Syrian queens it will be an impossibility to suppress their drones, on account of earlier breeding and swarming, and, hence, their earlier drone-rearing proclivities. If, as seems to be the case, they build proportionately more queen cells when made queenless or preparing to swarm (the queen-rearing and dronerearing instincts being analogous), do they not also rear more drones than the Italians?

The disposition to breed later in the fall and earlier in the spring will, in Northern localities, prove an advantage; but in central and Southern latitudes it will be a serious objection, as in the majority of winters breeding will be kept up without intermission, and starvation be the result, unless an extra allowance of stores is provided. During an unfavorable honey season this in many cases would be impracticable, in any latitude.

It it should prove, after a full and thorough series of investigations, that the tongues of the Syrian and Cyprian bees are of sufficient length to take the nectar from red clover blossoms, and it should be demonstrated practicable to rear Italian drones with which to modify their irrascible dispositions. then these new races will prove an invaluable acquisition to our favorite profession, and the further search for the "coming bee" will be closed with the glad refrain, "Eureka! Apis Americana!" But unless their dispositions can be modified, they may bring beekeeping into disrepute in thickly populated communities, and cities and towns will unite in indicting us for moment. This preparation should be establishing and maintaining nuisances in their proximity.

We learn with regret that the Rev. L. L. Langstroth's health is again failing. In a private note to us he says: "I am unable to take any inter-

Mr. James Nipe, of Spring Prairie. Wis., addresses us as follows:

I would like to inquire, through the BEE JOURNAL, the best way and time after the honey yield stops to extract the surplus, where run for extracted honey? Is it best to extract from the upper story as soon as ripe, and return the combs to the hives, or wait a few weeks till cool weather comes and the bees are reduced in numbers, then remove the honey and the upper stories at the same time, and save once handling? Would they not carry too much below, if left that long?

much below, it left that long?
Will it do to winter a colony of bees
that cover 6 combs, on 3 combs nearly
empty and 3 filled full and capped?
My brood combs will be left pretty
empty, and I shall be obliged to give
winter supplies from the samples. winter supplies from the surplus.

This summer I put combs containing moths into my hives; if I am in a hurry, the bees will clean them out cheaper than I can. Such combs must only be put in strong colonies.

As soon as the honey yield has ceased do your extracting, so as to give the bees all the time possible for putting their homes in order for winter. Many bee-keepers of large experience do their extracting at stated periods during the season, or as fast as the yield from each species of blossom has entirely ceased, and this is quite necessary where it is desirable to properly grade and brand the honey. It is a very difficult matter to sell honey as white or sweet clover, if the purchaser can detect one-fourth or one-half of it. as linden, and much buckwheat mixed in will detract from the appearance and price of heartsease and goldenrod honey. We are of opinion, also, that more honey will be obtained where extracted as soon as the second story is comfortably filled and properly ripened, as the bees will work with more vigor, and entertain less thought of swarming.

There need be little fear of the bees carrying too much honey below, for it can be easily detected when you overhaul your hives to prepare the bees for winter, and can remove some to give the queen room to breed till the last attended to during the last of September or first of October.

Three empty combs are too many to leave in the hive, where there are sufficient bees to cover six frames. We would prefer the other extreme: i. e., one empty comb, four frames of honey, est in bee matters." We much regret and spread the five to occupy the space this announcement, and hope that his of six. If a little honey is left in the timony of those who have crossed the life may be prolonged and be more hive in spring it will do no harm, but too many empty combs in midwinter different depots of food.

be imposed upon the stronger colonies.

### The Honey Harvest in Scotland.

We have received the following from Mr. John D. Hutchison, dated at Glasgow, Scotland, Sept. 10, 1881;

The honey harvest in Scotland may now be looked upon as a complete failure. No doubt there has been a little clover honey gathered in some quarters; but as regards heather honey, it may be safely said that it will be nil. may be safely said that if will be not.
This is very much to be regretted, seeing that the honey harvest is also deficient in other countries. So we may not expect to have much imported to us. The average crop of honey gathered here annually may not be very much, but what is gathered is always famed for its superior quality, espe-cially the heather honey. Throughout the whole summer we have had noth-ing but wet and showery weather, and owing to the want of sunshine, it has retarded the labors of the bees very much.

More rapidly, even, than we anticipated, is the foreign outlet for Ameribly export, this season, five times the amount of surplus they can possibly spare. By glancing at our home market reports, it will be observed the tendency of prices is upward.

### Melilot Clover for Stock Pasture.

Prof. C. E. Thorne, of the Ohio State University, has given the following highly encouraging endorsement of all we have ever said regarding our favorite honey plant. In fact, the Professor goes further than we had 30 days. dared to, in the face of the many unfounded prejudices existing against it. The Professor says:

It will grow quite huxuriantly in hard poor clay, where even white clover will scarcely live at all, and grows much more rapidly than red clover in any soil, while in the soils that are, as is said, "Clover-sick," it thrives as well as anywhere. It is a good forage plant for bees and for cattle, and is well adapted for soiling, as it makes a growth of 4 to 6 feet during the season, and is said to bear 2 or 3 cuttings. A German analysis gives its hay a feed German analysis gives its hay a feeding value of \$15 per ton as against \$16.28 for very good red clover hay. While red clover, upon which our farming in many sections, and especially in clay lands, depends so essentially for crops of grain, is becoming more and more uncertain. It ing more and more uncertain. It would seem to be worth while to try this "fast weed" as a resource for reenperative green manuring, in heavy soils especially.

To sum up, it is worth more to the farmer for soiling than red clover, beeause of its thrifty growth; it is a more reliable pasture for cattle, sheep, etc., than red clover, because it will thrive on soils where red clover sickder as red clover, because it will stand two or three cuttings; and it lacks but 'their tickets in season. 7 per cent, of the nutritious properbelieve it is worth the cost of cultivation to the bee-keeper, for honey alone, a four-footed animal, because its flow plants, notably white clover and linden. at 3:21 p.m. and 4:26 a.m.

by copious rains all over the country. Of course, the removal of moths, It has been a cruel drouth, destroying cleaning moldy and soiled combs, or much vegetation and fruit, but there any other drudge-work, should always are some compensations; while this year it has damaged our crops, it will for the next season make the land more fertile. An exchange remarks: "The evaporation from the surface of the ground brought up water from a great depth, and this came charged with lime, potash and the phosphates, and, as the water went off in the form of vapor, these were left in the surface soil."

> President Garfield is dead. The hand of an assassin has ended a career that might have been a great blessing to the country at large. He died at Long Branch, N. J., on Sept. 19, at 10:35 p. m., after a severe struggle for life for almost 80 days. He was taken to Washington last Thursday, and was buried at Cleveland, O., on Monday, Sept. 26. Vice President Arthur has now become President.

The whole Nation is wrapped in habiliments of woe. The great heart of fifty millions of Americans is can honey being developed. We have touched; as the heart of one, it mourns no doubt our producers could profita- the untimely death of him it had learned to love.

Not only does the people of the United States deplore this sad event, but Canada sent her representatives to the funeral, and donned the garments of mourning. England, too, keenly feels the blow. Her majesty, Queen Victoria, telegraphed to her representative in Washington to place a handsome wreath on the coffin, sent a personal message of consolation to the widow of our revered President, and ordered her Court into mourning for

All the Nations of the world have signified their abhorrence of the dastardly deed of the assassin, and sympathize with us in our loss.

Let us hope that the kind and fraternal feeling of the World towards America may never again be marred by war and its consequent evils.

The Funeral in Cleveland, and funeral processions in all the large cities have suspended business, and are unmistakable proofs of the real grief of the Nation.

"God reigns, and the Government at Washington still lives." Sixteen years ago, when Abraham Lincoln lay dead by the hand of an assassin, he who sleeps the eternal sleep, uttered these words, and it is well for us to remember them now. The country is safe, the Government still lives, and a people which has borne up thus long will meet the emergency as a brave people should meet it.

Those contemplating a trip to Lexington, Ky., to attend the Naens; it will yield equally as much fod-tional Convention, would do well to determine on the route and procure

The Cincinnati Southern Railway ties of red clover. We can add, we is the direct line from the North and South to Lexington. Three trains leave Cincinnati daily-at 8:30 a.m., even though he is not the possessor of 4:00 and 7:25 p.m., arriving at Lexington at 11:32 a.m., 7:15 and 10:00 p.m. of nectar is not affected by atmosphe- | Trains leave Chattanooga at 5:00 a.m. ric changes, as is the case with many and 7:30 p.m., arriving at Lexington

### TWELFTH CONVENTION

OF THE

### North American Bee Keepers' Society

TO BE HELD IN THE

Odd Fellows' Temple, Lexington, Ky., COMMENCING ON

WEDNESDAY, OCTOBER 5, 1881.

The time selected by the Executive Committee for holding the National Convention, at Lexington, Ky., is October 5, 6 and 7, 1881. All beebeepers are invited to attend and take part in the deliberations of the Convention. As Lexington is a central point, the Executive Committee hope point, the executive Committee hope to have a large attendance from the North, South, East and West, and from Canada, and that the 12th annual meeting of the North American Bee-Keepers' Society will be the most in-teresting mosting that the last interesting meeting that the bee-keepers of the United States have ever held. N. P. Allen, Pres.

### Report of Committee of Arrangements.

The Convention will be held in the Odd Fellows' Temple, East Main Street, be-tween Market and Mulberry Streets.

The special reduced rates at hotels are as follows: St. Nicholas hotel, directly opposite the Odd Fellows' Temple, \$1.40 per day; Ashland House, \$1.50 per day; Xew Phonix hotel, \$2.50 per day (regular rate). All of the above are first-class hotels. Parties desiring private board, at \$1 per day; can address a postal card to W. per day, can address a postal card to W Williamson, Lexington, Ky.

Williamson, Lexington, Ky.

Railroad fares are as follows: C. H. & D. Railroad, to Cincinnati; Dayton & Michigan, to Cincinnati; C. H. & Indianapolis, to Cincinnati; Cincinnati, Richmond & Chicago to Cincinnati, Richmond & Chicago to Cincinnati, Cleveland, Columbus & Indianapolis,—all full fare one way, one cent per mile returning. Cincinnati Southern Railroad, Cincinnati to Lexington and return, \$4; all intermediate or local stations \$2½ cents per mile each way; from Chattanooga to Lexington and return, 2 cents per mile each way. Kentucky Central Railroad and Lexington & Big Sandy Railroad, all stations between Cincinnati to Lexington and Mount Sterling and Lexington, \$2½ cents per mile each way; Louisville C. & Lexington R. R., \$2½ cents per mile each way.

A letter from the general passenger agent

A letter from the general passenger agent says: "At the time the Convention meets the Exposition in Louisville will be in full the Exposition in Louisville will be in full blast, and you can take advantage of the low rates made to the Manmoth Cave at that time." The regular rates to parties of 25 is \$5.50 for the round trip; but no doubt the excursion rate will be far below this figure. When a party of 10 is formed, the hotels and proprietors of the Cave make a reduction of 25 per cent. off regular rates, which are: Hotel. \$3 per day: Grand Route in Cave, nearly 20 miles, \$3 each, including guides, etc.; Short Route, nearly 8 miles, \$2; Chief City, 5 miles, \$1; Manmoth Dome, 3 miles, \$1; White's Cave, 2 miles, \$1; the Grand Route includes all.

We should be pleased to receive a postal

We should be pleased to receive a postal card from all whothink they will attend, with suggestions that may be of interest.

with suggestions that may be of interest.

If 100 or more wish to visit "High Bridge," the highest bridge in the world, at the low rate of 50 cents for the round trip, they may do so. This bridge is situated 22 miles south of Lexington, on the Cincinnati Southern Railroad, and spans the Kentucky river, surrounded with romantic scenery of natural beauty. If found necessary the Convention can adjourn on Friday morning, the 8th, at 10.30, as the train leaves Lexington for High Bridge at 11.30, and returns at 3.21, giving about 2 hours at the bridge; those going north to Cincinnati need not leave the train.

The Cincinnati and Louisville Exposi-

to Cineinnati need not leave the train.

The Cineinnati and Louisville Expositions will both be in progress. Those who can possibly do so are cordially invited to attend the Ky. State Boe-Keepers' Convention, which needs in Louisville Exposition Building, Oct. 12.

Chas. F. Muth. Cineinnati, O.

WM. Williamson, Lexington, Ky. cordially in-

Those sending articles for exhibition will please prepay freight or express charges, and send plain directions how to be returned; if desirous of selling them attach a card stating the lowest price in plain figures. I will cheerfully and impartially attend to exhibiting queens, hives, and other implements for the apiary, of any kind, free of charge. I will exercise all due care, but will not be responsible for losses of queens or bees by death or accident. WM. WILLIAMSON.

### PROGRAMME.

WEDNESDAY, OCT. 5.

MORNING SESSION. 10 to 12.—Convention called to order. Reading minutes of the last meeting. Reading of correspondence. Calling the roll of members for last year,

caning the roll of members for last year, payment of annual dues, receiving new members, and distribution of Badges. President's Annual Address. Reports of Secretaries, Treasurer, Stand-ing Committees and Vice Presidents.

AFTERNOON SESSION.

to 5.—Appointment of committee to nominate officers for the coming year, to report Thursday morning.

Addresses to be Followed by Discussion.

The New Bees— Prof. A. J. Cook, Lansing, Mich.

Frot. A. J. Cook, Lansing, Men. Foul Brood among Bees—
C. F. Muth, Cincinnati, O. Can Honey be made a Staple Product?—
C. C. Coffinberry, Chicago, Ill. Report of honey crop for 1881.

EVENING SESSION. 8 to 9.30.—Receiving new members. Miscellaneous business.

Addresses to be Followed by Discussion.

Wintering—C.J. Robinson, Richford, N.Y.
The Cultivation of Honey Plants—
W. T. Stewart, Eminence, Ky.
Progressive Bee-Keeping; or the Stepping-Stones toward Perfection—
Thomas G. Newman, Chicago, Ill.

The rest of the evening will be devoted to a social interchange of views between those present on any topics desired.

THURSDAY, OCT. 6.

MORNING SESSION.

9 to 12.—Report of nominating committee. Election of officers and Installation.

### Addresses to be Followed by Discussion.

Hadresses we Follow the Mexico, Mo. Bee-Culture—past, present and prospective—Rev. L. Johnson, Walton, Ky. The Different Races of the Honey Bee, and their Geographical Distribution—Dr. J. P. H. Brown, Augusta, Ga.

How to Prevent Swarming— C. P. Dadant, Hamilton, Ill. Obstacles to Progressive Bee-Culture— G. W. Demaree, Christiansburg, Ky.

AFTERNOON SESSION.

to 5.-Balloting for time and place of next meeting.

### Addresses to be Followed by Discussion.

Addresses to be Follower by Discussion.

A free-and-easy, go-as-yon-please Recital of a Bee-Keepers' Holiday—
Rev. W. F. Clarke, Listowel, Canada. Wintering Bers in Texas—
Dr. Wm. R. Howard, Kingston, Texas.
Swarms vs. Comb Honey—
Dr. C. C. Miller, Marengo, Ill.
My Experience; or How I Learned to

My Experience; or How I Learned to Handle Bees Profitably— Dr. E. Drane, Eminence, Ky. Dysentery in Bees and Hs Causes— W. Thomas, Adelphi, Ohio.

EVENING SESSION.

8 to 9.30.-Miscellaneous business.

Addresses to be Followed by Discussion.

The Honey Bee and its Relation to the Science of Economics— Hom Melville Hayes, Wilmington, O. Social Interchange of Views on Miscella-neous Topics by those Present.

### FRIDAY, OCTOBER 7.

MORNING SESSION.

9 to 12.-New business, resolutions, etc.

### Addresses to be Followed by Discussion.

Addresses to be Followed by Discussion.

The Origin of the Present Races of Bees—
E. E. Hasty, Richards, O.
The Wintering of Bees—
C. F. Muth. Cincinnati, O.
Is Bee-Culture a Suitable Employment for
Women?—Mrs. L. Harrison, Peoria, Il.
Bee-Keeping as a Business, or the Sole
Vocation of an Individual—
W. J. Davis, Youngsville, Pa.

AFTERNOON SESSION.

1 to 5.—Reading of correspondence.

Addresses to be Followed by Discussion.

Breeding to Improve Bees— C. J. Robinson, Richford, N. Y.

C. J. Robinson, Richford, N. Y.
The Influence of Honey on Wintering—
Chas. Dadant, Hamilton, III.
Honey Bee Literature—What it Is, and
What it Should Be—
Judge W. H. Andrews, McKinney, Tex.
An Essay (subject not yet stated)—
A. J. King, New York City.
Essays are expected from Wm. Carr, Newton Heath, England, and other European
aniarists.

Final business, and adjournment.

For the American Bee Journal.

### Honey the Proper Food for Bees.

A. R. KOHNKE.

Prof. Reklam writes in his paper, Gestundheit (Health): "Bee-keeping deserves recommendation not only on account of the gains derived from the sale of honey and wax, but much more so because it furnishes a food for man which is not excelled by any other as regards digestibility and nourishing qualities; for it is taken up by the blood vessels like water, without decomposition or other chemical change in the stomach, and thus serves as composition or other chemical change in the stomach, and thus serves as food without a particle of waste mat-ter, entering the animal tissue at once in a most available form."

This being the case not only with man, but also with bees, we can see why young bees, which live only on honey, need not leave the hive to void their excrements before the 10th or 14th day. Only after their store of nitrogenous compounds in the body is exhausted by the secretion of food through the glands in the head to feed the larva, it is that they are compelled to resort to nitrogenous food contained

in pollen.
This leads me to consider Mr. Heddon's theory, advanced in the Bee Journal of Sept. 7, page 283, as the only probable cause. I had the good fortune last summer to stay with Mr. Heddon about 2 months, during which time we discussed the bacteria question quite often as being the cause of tion quite often as being the cause of dysentery. Mr. Heddon had observed that the colonies which were delicient in stores, hence had to be fed in the fall, generally escaped the disease; those which had enough, or even more, were the worst affected. Now, as feed for the light colonies, Mr. Heddon used a solution of the very best white sugar and honey, which was boiled to used a solution of the very best winterest and honey, which was boiled to nearly the consistency of honey. Those colonies generally wintered well, furnishing a very plausible reason for his theory, for he reisoned thus: "If I boil the food for the bees they are to winter on they do well; if not many of the book of the bees they are winter on, they do well; if not, many of them are diseased, hence it must be bacteria, which are killed by the boiling process, and remain alive in natural stores gathered by the bees." This ral stores gathered by the bees." This being his experience for a number of years, it is natural enough to guess at the theory he first advanced, although

Inc theory is instantanced, although I considered it as not probable.

Mr. Heidon arrived at his latest conclusion, he states very explicitly, by actual ocular observation. He has seen an excess of pollen in such colonies as have been effected or died with the disease, and puts the question, "How can we prevent the bees from an undue consumption of the pollen, if not by robbing them of it?"

Now it appears to me that the undue consumption of pollen, in a cold win-

ter permitting no flight, is only a secondary (though immediate) cause of dysentery, it being a result of a primary cause. Which bees in a colony eat ary cause. Which bees in a colony ear pollen, and for what purpose? are the next questions to answer. It is known that the most pollen is consumed when brood is reared. It is also known that brood-rearing is mostly done by young bees. There are some few facts known bees. There are some tew facts known by scientific men and bee-keepers of which the average apiarist is ignorant. Some of these facts relate to the sali-yary glands in the head of the worker bee. It will be found on dissecting a young bee, that the largest glands are in the head, and secrete the food for the young larvæ; this food or secretion the young fatvæ, this food of secretion is the so-called royal jelly (which Mr. Robinson pronounces semen), and is furnished to larvæ of the worker bees in limited quantities to prevent an undue development of the sexual organs; before sealing the cells containing the larvæ, they are supplied with a store of honey and pollen.

The feeding of the larvæ with this jelly soon exhausts the young bees, and to restore the lost nitrogenous compounds, they have to resort to eating pollen to keep up this secretion, until finally the glands, by the con-stant drain on them, are too weak to fulfill their office, when the young bees leave the hive to gather honey and pollen, if there is any. On examina-tion, it will also be found that in old from it will also be found that it only bees these glatids are all shriveled and dried up. Some will ask, What has all this to do with dysentery? Everything, as will appear by the following: Toward spring bees commence to breed. If there are not a large number of veryes bees the able to preher of young bees the old bees must act as nurses, being enabled to do so only by consuming large quantities of pollen. If they can fly now and then no harm will follow; if not, dysentery or spring dwindling is certain. Pollen the bees must have if they are to breed, but if there are plenty of young bees, they will not consume more than necessary.

To prevent dysentery and spring To prevent dysentery and spring dwindling we want young bees; to get them, we must induce late breeding by feeding, if the honey flow is scant in the fall or stops suddenly quite early. It will thus be seen why Mr. Heddon's fed colonies generally wintered better than those not fed.

Youngstown, O., Sept. 9, 1881.

### The Golden Honey Plant.

G. L. TINKER, M. D.

We have growing extensively in this section the greatest honey producing plant for August and September that can be found anywhere. It eclipses buckwheat, goldenrod, asters, Spanish needles, and every other fall plant for both honey and pollen. From the first day of August every year the bees take to it and work on nothing else as long as it blooms. This year, owing to the drouth, it failed about the first of September, but all through the hot and dry weather of August it bloomed We have growing extensively in this and dry weather of August it bloomed in great profusion, and the bees worked upon it from early morn till dark, ma-king their trips of two miles (the nearest large patch of perhaps 20 acres) with all the excitement of a white clover harvest. I passed the field several times, and it was at all hours of the day swarming with bees—my Italians and the blacks from neighboring

Some colonies gathered 10 to 15 lbs. of box honey from it, and some that I divided filled 4 full frames, besides filling and sealing up the balance of the frames. The honey is a beautiful, transparent, golden-yellow color, having a rich, aromatic taste, and might well pass for "wild honey." It colors the capping somewhat, but gives the It colors honey a rich appearance. For the ta-ble I prefer it to white clover or basswood, on account of its fine tlavor. It produces seed in great abundance.

and seems to be increasing on our river bottoms and the adjacent hill-sides every year—the seeds being scattered by high water every spring. It will grow huxuriantly anywhere, and once established in a locality, it continues to grow there every year, among trees or in the open fields, to the exclusion of

all other plants.
The plant grows from 5 to 8 feet high, throwing up several stalks from the same root, and branching out into large corymbs of beautiful yellow flowers, that in a large field makes a perfect sea of continuous bloom.

I believe that it can be cultivated to

great advantage to the apiarist, and once a field is set with it, it will remain from year to year without further attention, and furnish every year the very best quality of honey for the bees to winter upon and for the table. The pollen is a fine golden-yellow, and abundant. As no common name has abundant. As no common name has been given to the plant in works upon botany, I have named it the "golden honey plant" (Actinomeris squarrosa).

If our bee-keepers are to cultivate

high enough, but that it will prove the one great fall honey plant, and super-sede all others as its virtues become nown. I send a packet of the seeds. New Philadelphia, O., Sept. 16, 1881.

(We have received the packet of seeds, which we shall plant next season. Every bee-keeper should make a point of lending encouragement to the development of new honey plants, as sometimes the more popular varieties are not suited to all climates and

For the American Bee Journal.

### Italian and Cyprian Bees.

CHAS. DADANT.

Several years ago I read an article, in which the writer said that a queen was worthless after having laid 200,000 was worthless after having had 200,000 eggs, and that queens could not live more than I or 2 years, and some even less. According to my experience, queens can live 3, 4, and even 5 years, some being prolific all the time. The writer of that article was one of those who used to put the color of the bees above all other amplifies and I wrote above all other qualities, and I wrote an article to warn the bee-keepers against this pernicious idea.

Having imported 3, of the Italian bees introduced into this country, and wintering many every year in our own apiaries, I feel that I am entitled to give my views in this matter. The queens that we received from Italy were not as bright in color, and their bees were darker than those of their daughters, after a succession of 2 or 3 generations, reared with a careful selection as to color. But such a one-sided selection was not to be followed without regard to the other qualities, for, according to our experience, and that of hundreds of others who had written to us on the same subject, the leather-colored imported queens, and their leather-colored progeny, were more prolific, more hardy, more long-lived, than were those of the very yel-low bees. It is for honey that we keep bees, and not for beauty.

My article was considered by many bee-keepers as drumming for the sale of our bees, some people being unable to understand that one cannot be moved but by selfish motives.

Mr. Demarce was the most eager against the dark or leather-colored Halian bees, and in his writings, as well as in the Bee Conventions, he denounced them as hybrid bees, full of vindictiveness, and always ready to fight

I would be pleased to know where he obtained such a notion. I have never had a complaint on the bad temper of the imported bees we have sold, and Mr. Demaree does not speak fold, averaging he had a complaint on the bad temper of the imported bees we have sold, and Mr. Demaree does not speak from experience, as he never bought a single queen from us. His assumption that the leather-colored bees from Italy are vindictive, was born in his imagination.

In the BEE JOURNAL for Sept. 14, In the Bee Journal for Sept. 14, page 294, he continues his accusation against the leather-colored Italian bees, imagining that the bad temper of our Cyprians comes from their mixing with the dark Italian bees. Let me advise him to read, in the same number of the Bee Journal, page 291, what the Rev. Mr. Clarke says:

"I am not enamored with the Cyprians; their temper is unamiable. I had the pleasure of seeing a Cyprian ratine pleasure of seeing a Cypitan colony make Mr. Jones beat a hasty retreat. It was a pleasure, because he ridicules my veil, which enabled me to stand my ground, while he was forced

No doubt the Cyprian bees can be handled by selecting the day, the weather, and the hour which will suit them. Had we but 30 colonies to handle, as is the case with Mr. Demaree, such a selection of circumstances would be

of the weather being unsuitable to the handling of our Cyprian colonies. We want to master our bees, not to be mastered by them.

mastered by them.
Mr. Demarce says: "Mr. Dadant's
evil report concerning his Cyprian bees
does not sound well, after advertising
and selling them." I would be glad to know what we had to do? As soon as we ascertained the bad temper of as we ascertained the bad temper of these bees we ceased advertising them, although having  $^3_1$  of them on hand yet. Would it have been more honest to continue to sell them, without saying a word about their irrascibility i

To sum up, I advise correspondents hen writing articles for the Bee when writing articles for the BEE JOURNAL to give facts, well observed facts, rather than assertions having no better foundation than a too active

imagination.

The mixture of the Cyprian and The mixture of the Cyprian and Italian race does not produce cross bees, as Mr. Demarce intimates; on the contrary, all our hybrids of Cyprian and Italian are very gentle and beautiful, though not so beautiful as the cross and pure Cyprians. This is proved by the reports of all those who have them. I therefore think that the Cyprian will do to cross with the Italian. them. I therefore think that the cyprian will do to cross with the Italian, and let all remember, that we do not a many interest for we have say this for our interest, for we have stopped advertising the Cyprian bees

### The Test of the Prize Queens.

REV. E. L. BRIGGS.

The committee came together on the 20th inst., as appointed for their decision in reference to qualities of the contestant prize queens, which had been sent me as such. They first debeen sent me as such. They first decided upon the numbering of the standard of excellence, placing the imaginary perfection of the coming bee at 100, for each of the points as to size, color, gentleness and prolificness

in offspring—total, 400.

They unanimously gave their ver-They unanimously gave their verdict in favor of a queen and her progeny, sent me by Dr. f. P. Wilson, of Burlington, Iowa, the sum of all her markings being 385, in 400. The second one was from Wm. P. Henderson, of Murfreesboro, Tenn., her markings being 36313. The next was from Mr. Wm. Lossing, of Hokah, Minn., hers being 36313. The others were pronounced splendid, but fell behind a little in some of their points. No one hittle in some of their points. No one need fear in ordering queens from either of the live contestants, if their bees rate up with those sent to me.

So well satisfied am I with the result

of the offer, that those who sent forward their queens may draw on me, if I am alive and well, for a young queen from either one of these prize if I am alive and wen, we a queen from either one of these prize queens, as they may choose in addition with wice without cost. The to her sale price, without cost. The sale price will be forwarded on my rethrn home next week, or as soon as the several bills come to hand. The report, of course, will be forwarded so as to appear next week. Wilton, Iowa, Sept. 22, 1881.

For the American Bee Journal.

### Honey Sweating and Watery.

w. R. YOUNG.

The honey season is over, and only a moderate amount of surplus honey secured. White clover, which is our principal source, bloomed, but did not yield much meeter.

principal source, bloomed, but did not yield much nectar.

In June and July, 1879, I Italianized my apiary. In 1880, my pets gave me considerable surplus. I stored it in an upper room of my dwelling house, and was well pleased with Italians. Soon I discovered the honey was becoming unsalable; it would sweat, get watery, ooze, run and saturate the bottoms of the sections. While I had blacks, I kept the surplus in the same been given to the plant in works upon bottoms, I have named it the "golden bottomy, I have named it the "golden which we have Cyprian bees. When honey plant" (Actinomeris squarrosu).

If our bee-keepers are to cultivate any plant for honey alone, I really think that I have not rated the plant very irksome to be delayed on account in your locality. Neither of which is correct. In Quinby's new Bee-Keeping, Mr. L. C. Root says, "Italians store the cells fuller, and cap them over directly against the honey, giving the surface a watery appearance, while the blacks leave a little unfilled space." This I am satisfied was the true reason, and I concluded a remedy must be found, or else I must return to blacks for salable surplus.

The present season I have the same

serious trouble. I tried putting some back on the hives; the bees licked it off very nicely, and removed a considoff very incelly, and removed a considerable portion, and appeared much obliged for my kindness. Now I see you give Mrs. L. Harrison's remedy for the same trouble. She says, "wrap the boxes in newspapers and put them on top of the emploard in the kitchen." on top of the capholatan the kitchen.
If this is a remedy, it may do for a small quantity of honey. I would like to know if other honey producers have the same difficulty to contend with, and how they manage.

Myersville, Md., Sept. 5, 1881.

[Will any one give the remedy found to be the best in their experience?-ED.]

For the American Bee Journal.

### Have Our Bees Degenerated?

E. A. THOMAS.

On page 178 of the Weekly BEE JOURNAL, Mr. G. M. Doolittle says: "On pages 145 and 147 of the Weekly

BEE JOURNAL, are articles by E. A. Thomas, and S. S. Butler, both saying that all the losses of bees in winter, prove that the losers have a weak race of bees, or those which have degenerated from their once hardy and pros-

perous condition."

Now if Mr. Doolittle will read my article on page 145 carefully, 1 think he will fail to find anything in it that will convey the above meaning. I have not attributed all the losses of the past winter to the weakness of the race, or to any other one cause, for I race, or to any other one cause, for I think there are a great many causes; but I do assert that some of the losses can be accounted for in this way. When I read reports of bee-keepers who have lost ½ of ½ of their bees, I always think the rest are of but little value for that season, and why? Because in a majority of cases, the rest are to weak to build us trongenously cause in a majority of cases, the rest are too weak to build up strong enough for the honey barvest, mere handfuls of bees that can hardly live through the spring. I do not wish to be rough or to discourage any one, but facts are facts, and I have gleaned enough from my correspondence to give an aground for my assertions.

Dealithe says: "When the

Mr. Doolittle says: "When the spring of 1875 opened, 1 found 1 had but 46 colonies left out of over 100 the fall previous, and from those 46 colonies 1 sold over 4,800 lbs. of box honey."

That is good; but supposing Mr. D. had wintered his 100 colonies in excellent condition, what then? Why, he might perhaps have obtained the enormous yield of 12,000 pounds. Probably Mr. D. spent a great deal time and money to get his 46 colonies in conditions.

money to get his 46 colonies in condition for the honey harvest. But he must remember that all bee-keepers have not the time and skill to do this, and to such, weak puny colonies in the spring are of but little value.

If Mr. Doolittle thinks there is no difference in bees, and that one strain is as hardy as another, then why does he take any pains in rearing his queens, or why does he consider queens reared from swarming cells superior to all others? Why should there not be as much difference in bees as in other animals?

as in other animals?

I recall to mind the case of an apiarist who several years ago lost all his bees, and, wishing to secure a hardy strain, re-stocked his apiary with bees from 3 different sources, and kept a record of each strain. I will designate the three strains by numbers, 1, 2 and

in your locality. Neither of which is through in spring with the following correct. In Quinby's new Bee-Keep- result: No. 1. All came through through in spring with the following result: No. 1. All came through strong, with the exception of 2, one having the dysentery, and the other being queenless. No. 2. All came through very strong and vigorous, with the exception of 4, one being dead, and the other 3 being weak. No. 3 sustained a loss of 89 per cent., and the remainder were all very weak. Now why did number 1 and 2 winter in good condition while No. 3 nearly all died? The only way that I can account for it is that No. 3 was a weak, puny race. Since then he has taken a puny race. Since then he has taken a great deal of pains with his colonies, and during the past severe winter sustained a loss of only 5 per cent. I have queeus from strains No. 1 and 2 in my apiary now which look very tough and

I know of another bee-keeper who had practiced in-and-in-breeding until his bees had nearly run out, half of them dying every winter, and the rest them dying every winter, and the rest coming through in spring so weak that they could not be built up strong enough for the honey harvest. Two years ago he re-queened his apiary from the stock of a man who had taken pains to breed a hardy strain of bees and since then his bees have wintered well, being very strong when the honey flow came, and so giving him 4 times as large honey crops. Now, as the bees were wintered in the same way, why is it that his present strain came through the past present strain came. through the past severe winter in good condition, while his former strain could hardly stand a mild one?

l do not believe that the losses of Messrs. Doolittle, Hetherington, Palmer and others, can be attributed to this cause, for they are all skillful and careful apiarists, who would not let their bees degenerate. But I do think that there are many careless beekeepers, and I am afraid now and then a concentreeder who takes no pains to a queen-breeder who takes no pains to keep up the stock of the country. The importation of cheap, poor stock, may tend to degenerate our bees, and I hope this evil will correct itself in time, and only the best importations be tolerated into America.

1 will not say that the results of the past winter indicate that our bees have degenerated, but that they are not what they should be, or what they might be. The losses of the past should incite apiarists to fresh exer-tion, and no one should sit down contented until the goal is won, and the American strains of Italians have a world-wide reputation. If we will all do our part to attain this end, I venture to prophesy that the time will come when America will be exporting bees in large quanties instead of im-

Coleraine, Mass.

For the American Bee Journal, Review of the Season.

GREINER BROTHERS.

When spring opened and the earlier When spring opened and the earlier fruit-tree blossoms made their appearance, we found ourselves in possession of 85 colonies of bees. We sold at that time 15, leaving 70 out of 160 strong colonies last fall, which we undertook to winter. With the exception of a very few fair ones, about <sup>3</sup>4 of those were very weak, and the balance not much better, so that the prospect of a honey crop was decidedly against us. against us.

A writer of the BEE JOURNAL made

A writer of the BEE JOURNAL made the remark that weak colonies that just made out to live, might as well have died. This was not very soothing for our already discouraged state of mind, and if we had not been blessed with a good portion of hope, together with these encouraging words of the editor: "But with the bee-keeper all is not lost, though he lost all," we should have undeubtedly have given up in despair. We intended to strengthen our weak colonies by doubling up, but could get no chance to do the three strains by numbers, 1, 2 and ling up, but could get no chance to do and were prepared for winter in the same way. They were wintered out same way. They were wintered out same and we wished to doors, and well protected. They came save all the queens we could, we de-

cided to leave our colonies separate, and nurse them up as best we could

and nurse them up as best we come.

Time wore on; apple trees sent forth their blossoms, but yielded little honey, and our bees did not make as much headway as we had hoped. The pretheir blossoms, but yielded little honey, and our bees did not make as much headway as we had hoped. The predictions were all in favor of an abundance of white clover for this season, and we wished to get our bees in good condition as soon as possible; we therefore concluded to try feeding. We had about 70 beeless hives tilled with thick and partly granulated honey. so thick and partly granulated honey, so that the extractor failed to do thorough work. This we fed; we kept from 2 to 4 hives setting exposed in our bee yard for our bees to work on all the time, and to make it accessible, we retime, and to make it accessible, we removed one comb from each hive, spread the remainder, and uncapped all the honey. In this way we accomplished several objects: we fed our bees; we prevented the worms from having all their own way; we made use of the honey, and we got our combs in the best shape for trimming and patching wherever it was ming and patching wherever it was necessary.

It is needless to say that our bees

availed themselves of the opportunity to their hearts' content; by the time basswood honey commenced they refused to work at our hives any longer, but nearly all of them were cleaned out. At the same time we kept close watch of our colonies; we made it a point to keep an empty comb in the centre of each broodnest, so that every queen had ample opportunity to exert herself, according to her capability. The result was astonishing; about the 20th of June, our colonies had as fair a display of brood as could be desired, a display of brood as could be desired, though not quite as much so as Mr. Doolittle says: "Even to the bordering cells:" but what little space was left without brood was filled with capped honey, and this, we think, is just as effectual in regard to bees provided in the capped was as a sub-level. We working in boxes, as all brood. We would say here, that we never succeeded yet in getting combs entirely full of brood, hard as we have tried.

White clover appeared early and plenty this season, and we imagined the tons of clover honey harvested, as the fulfillment of the various prophecies of the coming honey season. But cies of the coming honey season. But alas! another disappointment came; wet and cold weather prevented bees from gathering clover honey to any amount; what little they did gather, together with our feeding, kept them breeding nicely; even preparations for swarming were being made, but yet no surplus honey. About this time, June 22 to 24, some of our young queens were getting ready for use, and we began to divide; we also use, and we began to divide; we also had some natural swarms, which were hived on full sets of comb, and in proper time all queenless colonies were supplied with young, laying queens. Thus, June passed and July came, and with it a change in the weather; our bees worked less on the honey we offered them, but went more and more in search of nature's sweetest nectar, until all at once, about July 8 or 10, they left our hives entirely, and the honey season commenced.

The way our bees worked for about weeks was almost incredible—far be-2 weeks was almost incredible—far beyond anything we ever experienced; but the strangest feature of the season was, that they did not stop work from the close of the basswood bloom, until buckwheat began. We always had a lack of honey between basswood and buckwheat of about 2 weeks, until this season, and the only explananation we can give, is that the less important honey plants, such as Canada thistle, catnip, etc., yielded more honey than ever before. To be sure, they did not work as rapidly as they did in the height of basswood, but they built comb and capped it at a perceptible rate.

Buckwheat began very promisingly; bees worked well for about 8 or 10 days, but the drouth cut off the latter part of the buckwheat yield, so that

 $\frac{1}{2}$  a crop, the season has been certainly a remarkable one for produc-

to give an explanation on the question: Is it an advantage to unite weak colonies in the spring, and why is it so? Whilst we are trying to investigate the matter in our own minds, the question presents itself in a mathequestion presents itself in a mathematical way. Supposing we had reduced our bees to one-balf of their number of colonies by doubling up, would they then have been twice as strong, and capable of producing twice the number of pounds per colony, which would have been necessary to produce the same amount of honey they did under the present circumstances? Would it be reasonable to suppose the same amount of honey they did under the present circumstances? they did under the present circumstances? Would it be reasonable to suppose that our average yield of 130 pounds, and the yield of our best colonies of nearly 400 lbs. of comb honey, could have been doubled in the supposed case?

These questions are worth discussing, and we would be pleased to bear from others on the subject.
Naples, N. Y., Sept. 19, 1881.

For the American Bee Journal.

### Bee-Farming and Pasturage.

J. H. MARTIN.

I was much interested in the editorial in the BEE JOURNAL in relation to

rial in the BEE JOURNAL in relation to planting especially for honey.

I own a farm of 100 acres, and it has heretofore been cultivated for general farm produce. As bee-keeping has become more and more my occupation, I have seriously considered the project of making it a bee-farm. A farm, or a tract of land could be filled up for the exclusive maximizer of bees. portion could be planted to forest trees, and another portion could be preserved for the sowing of honey pro-ducing plants. A rotation of these plants would be necessary, for, a cer-tain that for its part of the second tain plant for a number of years upon the same field would soon exhaust it from producing seeds or honey. Neglect to plow the land frequently, would give a chance for all manner of for-eign and useless brush and weeds to

spring up.

Now, the plan I am pursuing with my farm in order to keep its fertility up to the highest point, is to run in connection with my bees a dairy, of as many cows as the land will admit of. It would be less work for the bee-keeper to pasture with sheep, but aside from the sheep being of less profit at present prices of wool, cheese and butter, I find that the more sheep pas-tured, the less white clover we have

for our bees.

We well remember that during the We well remember that during the war when the price of wool went up to \$1 a pound, every farmer, both great and small, had his tlock of sheep, and sheep being such close feeders, white clover was quite killed on all pasture lands. But now the dairy interest is in the ascendant, and our pastures are again carpeted with white clover. I guarantee you will find but little white clover where sheep have been pasclover where sheep have been pas-tured for a term of years. We have therefore decided upon corn, for our stock to keep up the fertility of the

It is needless to recommend to the bee-keeper who gets the best blood in his hives, to also keep good blood in his barn. Blood pays in all cases, and if our farm will tlow with "milk and honey," we must adopt the best breeds and best appliances. The prime object in making a bee-farm, is to provide pasturage at a time when the bees do not get honey from what is termed, "natural sources." The first thing our bees want in the spring is pollen, and we can imagine with what admiration, the first pollen-ladened bee is greeted as it enters the hive.

In my locality, what is commonly known as "pussy willow," gives an abundance of pollen and a little honey as early as the bees are able to fly. This willow thrives upon marshy land, and if it did not grow abundantly in a It is needless to recommend to the

swamp near by, I would set out a hundred bushes. Soft maple also gives early honey, but I doubt if the quality is sufficient to pay for setting out these is summent to pay for setting out these trees, except now and then one for the sake of having a variety. Hard maple blossoms later, but I would make it of use by tapping, and allowing the bees to take it from the tree, when the weather will admit of the bees flying; weather will admit of the bees living; but my bees are quiet in the cellar during the maple sugar harvest. The sugar can be fed to them to advant-age. Every bee-farm should have at least a hundred sugar maples. The next blosson that comes to the

consideration of the bee-farmer is fruit. It is needless to say that every owner of an acre of land will not forego the pleasures derived from an orchard. In a farming district where trees have reached an age of 60 years, with a growth in proportion to their age, who can estimate the number of blossoms upon the tree, that looks like a mammoth snowball. The apiurist here not only gets the benefit of his own planting, but from the planting by his neighbor, and I find that of all fruit blossoms, the cherry tree is most visited by the bees. Persons having land near a good market, would do well to put out several acres to cherries. I hear but little about great yields from fruit trees; the reason, I think, is from the fact that few colonies of bees are in that "boiling over" condition to eld in the fruit bloom. condition to obtain the fruit bloom honey. I find that those colonies which are in that right condition, will invariably store a good yield from this source.

For early honey, I also think the black locust cannot be excelled. Upon my hundred acres, I propose to set out 2 acres of locust, not only for the honey, but for the valuable timber. In 4 years, locust will not only blossom, but will be large enough for stakes, and thereafter will rapidly become profitable both for honey and timber. Raspberries are not to be detimber. Raspberries are not to be despised as a honey producer, and if my hundred acres were located near a good market for the fruit, I would plant an acre or more of raspberries. There are many acres of wild raspberries around me upon waste pastures and in fence corners, but the tidy farmer will soon clear them from these places, and decompletes will have to be places, and dependence will have to be put upon cultivation. Whenever I seed a field that has been under cultivation, I am ever mindful of the clover, for upon this many times de-pends my success as a bee culturist. White clover seems to spring up spon-taneously upon all grass lands, and is the most permanent clover and honey producer 1 have, while red clover and alsike have to be sown every time when we put a field to grass. As I now sow alsike, I have adopted a plan by which I hope, by little expense, to add a hundred field to grass a Everywigh. I hope, by little expense, to add a hundred fold to my acreage. Every neighboring farmer is requested to give alsike clover a trial. I sell it at the same price per acre that it costs to seed with red clover, owing to the difference in the price of seed. I am out of pocket a little on every acre my paightness raw, but avery dent thus neighbors sow, but every cent thus expended will come back in countless golden drops of nectar next year. Alsike would find more favor with farmers if the cost for seeding an acre was about the same as for red clover. Sweet clover is looked upon with susclover. picion by the tidy farmers, and it would be against his progressive ideas to tolerate a plant that is of no apparent use; but as it is not a bad weed, seems to thrive upon the hard and seems to thrive upon the hard roadside, I am extending my sweet clover pasturage along every highway for miles around me. In addition to this, an acre will soon be sown to it upon my farm, followed by more if

bors. Mignonette, figwort, catnip, motherwort and other plants of this class I am giving a trial, and will give land to the cultivation of each as they prove their qualities. Buckwheat is another of those crops that gives a good return to the bee-keeper, and at least 10 acres should be sown to re-ceive much benefit. While, if your neighbors cultivate it, and extend your pasturage to hundreds of acres, a great number of colonies will find employment for several weeks.

The bee-farmer should not forget to plant a liberal number of basswood plant a moral number of basswood trees; next to white clover comes this tree in importance to the aplarist, and there is not a farm in the Eastern States that cannot well afford space for this noble tree. If planted upon the highway, I would plant withit the space maple. For a length of over 100 the highway, I would plant withit the sugar maple. For a length of over 100 rods, my highway is planted with an avenue of over 100 trees. Some of these trees have been planted 8 years, and now blossom. The apiarist will find, not only pleasure, but profit, in becoming to a certain \*extent a forest tree culturist. There are many corners upon our farms that had far better be planted to useful trees, than to ter be planted to useful trees, than to be infested as they are with weeds and brush. Our springs and small streams should be protected with a surrounding cordon of trees; they would then defy the scorching drouths of summer, and continue to fill our rivers for the continued benefit of commerce and manufactories. The apiarist should use his influence with his mighture in this direction for his neighbors in this direction, for the day will surely come when our forests will receive the attention that has already been too long neglected.

I have thus outlined something of my plan for a bee-farm. If there is person who has cultivated a farm of 100 acres or more exclusively for bees, it is his duty to give me the results of his experience.

In studying the matters of bee-farming, there are many points that come to me that I have not touched upon in the foregoing, but will give them to the readers of the BEE Jour-NAL at some future time. Hartford, N. Y.

For the American Bee Journal.

### Toronto Bee and Honey Show.

WM. F. CLARKE.

Under the stimulus of the liberal prize list offered at this exhibition, and which was recently published the American Bee Journal, there was a truly magnificent array of honey and apiarian supplies brought to-gether. The directors appropriated an entire building to the use of bee-keepers, and for the first time at a gether great exhibition on the American continent, "honey hall" advertised itself tinent, "honey hall" advertised itself side by side with horticultural ball, dairy hall, etc. Beside the building just mentioned, there was a large tent close by, where hives, extractors, live bees, and various out-door appurte-nances of bee-keeping were shown; also where an endless flow of bee-talk was indulged. Inside of dairy hall, honey was displayed in every form, calculated to make the months of spectators water. The tin packages and cans were gorgeously colored and labeled; the glass jars were in various beautiful shapes, and even the this, an acre will soon be sown to it upon my farm, followed by more if this first acre pays.

I find for late fall pasturage, it is better to mow sweet clover in August. A new growth comes up very profuse with blossoms. If it will give my bees business after basswood fails, I will sow 10 acres of it. I hope the cultivation of it will prove it useful for other than honey purposes. Could I make it useful like buckwheat, I could extend my pasturage the same as I did

my clover on the farms of my neighbors. Mignonette, figwort, catnip, equipment. I think in the variety and motherwort and other plants of this beauty of his packages, he rather took class I am giving a trial, and will give the lead. W. C. Wells, of Phillipston, and M. Ramer, of Cedar Grove, Markham, were also prominent exhibitors. Besides these, there were a number of others who made most creditable exhibits on a small scale. The following

hibits on a small scale. The following is the prize list:

Largest and best display of honey, Edmund Nugent, Strathroy, \$10; 2nd, D. A. Jones, Becton, \$5. Best 10 lbs. of extracted honey, D. A. Jones, \$5; 2nd, W. C. Wells, Phillipston, \$3; 3rd, M. Ramer, Cedar Grove, \$2. Best 10 lbs. of comb honey, M. Bamer, \$5; 2nd, Edmund Nugent, \$3; 3rd, W. C. Wells, \$2. Best mode of marketing extracted honey, D. A. Jones, \$5; 2nd, Edmund Nugent, \$3; 3rd, W. C. Wells, \$2. Best mode of marketing comb honey, Edmund Nugent, \$5; 2nd, W. C. Wells, \$3; 3rd, M. Ramer, \$5; 2nd, W. C. Wells, \$3; 3rd, M. Ramer, \$5; 2nd, W. C. Wells, \$3; 3rd, M. Ramer, \$2. Best comb foundation for brood chamber, D. A. Jones, diploma. Best 82. Best comb foundation for brood chamber, D. A. Jones, diploma. Best comb foundation for honey boxes, W. C. Wells, diploma. Best and most scientific mode of wintering out-door in any kind of hive, D. A. Jones, \$5; 2nd, Edmund Nugent, \$2. Best house for wintering bees and of the most use for anigrian numbers in summer. use for apiarian purposes in summer, working model to be on ground, represented by a scale of not less than one inch to the foot, D. A. Jones, \$5. Best winter and summer hive. D. A. Jones, diploma. Best and most practical invention for retaining even temperature in bee-houses, D. A. Jones, \$3. Best wax extractor, D. A. Jones, \$3. Best wax extractor, D. A. Jones, diploma. Best mode of securing the largest yield of box honey from a single hive, M. Ramer, \$3; 2nd, Edmund Xugent, \$2. Best mode of securing the largest yield of extracted honey from a single hive, D. A. Jones, \$3; 2nd, Edmund Nugent, \$2. Best and most valuable invention in bee hive not horsetofore axhibited as made hives not heretofore exhibited or made public, D. A. Jones, bronze medal, Best non-swarming hive, D. A. Jones diploma. Best bee smoker, D. A. Jones, \$2; 2nd, T. P. Hodgson, Horning's Mills, \$1. Best honey knife, D. A. Jones, \$2. Best honey extractor A. Jones, \$2. Dest noney extractor for general use, D. A. Jones, \$2; 2nd, Edmund Nugent, \$1. Best exhibit of bees and new races of bees, D. A. Jones, diploma. Best and largest dis-

Jones, diploma. Best and largest display of apiarian supplies, D. A. Jones, \$10; 2nd, Edmund Nugent, \$5. Best and most practical new invention for the apiarist, D. A. Jones, \$5. Best form of hive, D. A. Jones, bronze medal. Extras—W. C. Wells, comb foundation masher, commended. It will be seen by the above, that Mr. Ramer took the first prize for comb honey, and I do not hesitate to say, that the whole world never saw so handsome a lot. It was the astonishment of every bee-keeper on the grounds for purity, evenness and accuracy of form, the corners even being finished out as though the work had been done with a square and planer. The secret of it lies in the use of perforated zinc in the place of the planer. The secret of it lies in the use of perforated zinc in the place of the usual tin separators. It seems that bees do the best work standing on their heads. I have asked Mr. Ramer to send a sample of his honey and per-forated separators to the forthcoming Convention at Lexington, and I hope he will do so.

A smashing trade in honey was done at the exhibition. Thousands pt people might be seen with gay-looking tin cans dangling from their tingers, or with pretty glass jars in their langers, or with pretty glass jars in their hands, or nice boxes under their arms. They bought and carried them home very much as is usually done with toys and trinkets on such occasions. The success of this show awakens great expectations as to the future of bee-keeping in this country, and these few notes of it may suggest a wrinkle or two that will be serviceable to apiarts in other parts of the world. Toronto, Can.

The Eastern Michigan bee-keepers Association will hold its fall meeting in Detroit, Oct. 1, in the Y. M. C. A. hall, at 10 o'clock a. m.
A. B. WEED, Sec.

The Northwestern Bee-Keepers' Association will meet in Chicago, on Tuesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to myted to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. Miller, M. D., Pres. C. C. Coffinbriky, Sec.

KF The Western Michigan Bee-Repers' Association will meet in Berlin, Ottawa, Co., Mich., Thursday, Oct. 27, 4881, in Huntley's Hall, at 10:30 a.m. All interested, are cordi-ally invited. WM. M. S. DODGE, Sec. Coopersyille, Mich., Aug. 29, 1881.

The Northern Michigan Bee-Keepers' Association will hold its fourth Annual Convention at Maple Rapids, Clinton Co., Mich., Oct. 11 and 12, 1881. O. R. GOODNO, Sec.

The South Eastern Mich. Bee-Keepers' Association, will hold its 4th meeting at the Court House, in Ann Arbor, Wednesday, Oct. 5, 1881, at 9 o'clock a. m.; the week of the County Fair. An adjourned meeting may be held during the week. All interested are invited to attend. By order of the Executive Committee. Executive Committee.

N. A. PRUDDEN. Chairman.

The North Eastern Wis. Bee-Rep. The North Eastern Wis. Beekeepers' Association, will hold its fall meeting at Peewaukee, Wis., on Tuesday and Wednesday, Oct. II and 12. A full attendance is cordially requested. Notice of the plance of meeting will be found at the local Part Office.

Post Office.
GEO. Chunch, Pres., Neenah, Wis.
Frances Dunham, Scc., Depere, Wis.

Santh Western Iowa Rec Association. -The regular annual meeting of this of the regular annual meeting of the association, will occur at the aplary of James T. Fife, in Jasper township, near Corning, Iowa, on Thursday afternoon, Sept. 29. The place of meeting is such that the topics considered will be practically demonstrated. lowing is the programme: Business of Society; raising of queens; introduction of queens; dividing of bees; practical handling of bees. A full at-

tendance is desired.
J. T. Fife, Pres. W. J. OLIVER, Sec.

was Owing to the fact that the time of the regular meeting of the Union Bee Association, at Shelbyville, Ky., conflicts with the time fixed by the executive committee, to hold the Naecutive committee, to non the National at Lexington, the meeting of the Union, at Shelbyville, has been postponed till the 20th of October, G. W. Demaree, Scc. Christiansburg, Ky., Sept. 3, 1881.

The Rock River Valley Bee-Keepers' Convention, will be held at Momoe Center, on the third Tuesday in October. We hope a good atten-dance will be the outcome, and the bee interest revived.

D. A. Cupperly, Sec.

1987 The Michigan State Bee-Keepers' Association, will convene at Battle Creek, on Thursday, Dec. 8, 1881. We have reason to expect one of the largest and most interesting meetings argest and most interesting meetings we have ever held. Let all arrange to be present. All District Associa-tions should send delegates. Each per-son should come with their best experience in their hands, ready to hand it over to the others of the fraternity. It is hoped that all will bring the fullest report possible from their region.
Commutation rates are expected on railroads.

A. J. Cook, Pres.
T. F. Bingham, Sec.

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Wis., Nov. 30, 1881.
N. E. France, Sec., Platteville, Wis.

Removing Bees from Combs. I have tound that a fine, light-light broom is superior to anything else for removing bees from combs. It does not aggravate them, as does a wing of any kind. It is easily washed when besmeared with honey, and will last many years. To use the broom, do not sweep the bees off with the end of the logist hat use the side and corner. not sweep the nees on with the end of the brush, but use the side and corner with a quiet, short stroke. This has been a season of disappointments, for had and good results with me for the bees. The basswood and clover (on account of too much rain), werefalmost a failure. Other long rain spells have cut off the storing of large quantities of honey, being daily brought in. Yet I think that I shall be able to report a surplus of 75 lbs. to the hive, of comb honey. I have already taken 90 pounds from some hives. I am keeping this season, in 2 apiaries, 175 colonies of hees.

JOHN BURD. Bradford, Iowa, Sept. 17, 1881.

Another Way of Swindling. Some of my neighbors have paid a professional bee-man, who has been giving lessons to about \$450.00 through this locality, insuring that amount to be made out of the business in a stipulated time. Of course the purchaser had to give his note with interest. When the notes became due, they were found in the nearest bank for collection, and our professional bee-man, W. H. Melazine, is among the missing. We have had the most exten-sive drouth this county ever witnessed. Bees have done well early in the season, but since July 15, they have been consuming their stores, consequently there will be no surplus, in this part. The weather is still very hot, and the ground is parched and has cracked open. In my opinion, bees in this lo-cality will have to be fed. How much honey does a colony of bees require to winter on? And what is the best way of teeding? Should bees be put into winter quarters while the weather . l. D. Goldsmith, Ind., Sept. 8, 1881.

111 in the cellar, 20 to 25 pounds will answer: more will be required for outdoor wintering. Bees should not be ilights. Etc.)

Three Vears' Experience, I have had bees for 3 years; the first year I had 20 edonies, and sold \$23 worth of honey. The 2nd vear I had 47 colonies, and sold \$125 worth of honey. Now I have 73 colonies, and this fall it has been so dry that I have sold but 75 years. 570 worth. My bees are at the foot of a bluft on the Mississippi bottom lands, and are Italians. The Вке Jon EX VI. has been a great help to me. JAMES CORRET.

Palmyra, Mo., Sept. 19, 1881.

Is if Fool Brood? Please let me now, through the BEE JOURNAL, if one of my colonies has what is termed foul brood? It is one that has put out two heavy swarms this season one natural and one divided. The mother natural and one divided. The mother colony has dead brood in the combs in all stages of growth, and some hatching out, but they have no honey. I do not think I will put them away for winter. This has been a poorer season with us than the last was -1 will get some comb honey yet, perhaps 75 lbs. from 6 colonies, but no extracted.

Thomas Parke. State Centre, Iowa, Sept. 22, 1881.

| The brood was starved or chilled, caused by being robbed too closely of field workers. If there is much dead -Ep.1

Changing Blankets.—Would it be better to take off the old waxed cloths when packing in chaff in the fall, and through the BEE JOURNAL.
R SPILLETT.
Robinson, Ont., Sept. 18, 1881. Please answer

(Yes, if absorbents are used above, as the propolis would make absorption as well as upward ventilation next to impossible,—ED.]

Vindication of H. A. Burch & Co. – Through the AMERICAN BEE JOURNAL and Ghomings in Bir Culture 1 see that H. A. Burch & Co. have been placed in an embarrassing position, and to make it (as it seems to me) more embarrassing to Mr. Burch, our worthy embarrassing to Mr. Durch, our worthy bee papers are spreading the news, pushing, as it were, the man over the precipice. They have, seemingly, forgotten the old adage, "Never push a man when he is going down the hill." In past years, I believe, not a word of reproach nor a hint of crookedness has been becaused against H. A. Unich been brought against H. A. Burch. We have been told in Gleanings that Mr. Burch lost nearly all his bees (no crookedness in this) during the past winter. Now, it is no more than fair to presume that Mr. Burch's locality is not unlike our own and lots of others that we have heard of during the past summer, where, through ignorance or superstition, the bees that were left could not be bought nor had for love could not be bought nor had for love or money. Now, perhaps Mr. Burch (unwisely though) depended upon re-stocking his apiary with the bees owned by farmers in his vicinity and in this failed, and having a great many orders to fill with bees and queens, we can see very easily where it would place Mr. Burch. We know that Mr. Burch is behind with his orders, but we also know that he is filling his orders. I sent to him for a queen on the last of July, 1881, and received her on the first of September. I have waited longer on other queen-breeders. Let us be sure that Burch is a humbag before received which it is if he is a bumbag before received which it is in the best but the fore we say he is; if he is, let the people know it. If he is not, then let us help him up again. Charity for all.
J. A. BUCKLEW. Clarks, O., Sept. 17, 1881.

[We are exceedingly pleased to record the above instance of promptness on the part of Mr. Burch in tilling one order. Perhaps Mr. Bucklew is right in suggesting charity, for, after receivhoused or cellared until the weather ing scores of letters within the last has become too cool for quite frequent—two years complaining of Mr. Burch's irregularities, our charity for him was nearly absorbed in the desirc to do justice to our readers, -Ed.]

> Beetles for Name, - Inclosed find 1 higs that seem to feast on the peaches. Please give its name, habits and nature. It punctures the apples in the orchard as well as the peaches, and many orchardists have laid the damages of this bug to the honey bee.
>
> JOSEPH M. WISMER.
>
> Lordan Station Outario

Jordan Station, Ontario.

These beetles (not bugs) are the Enryomia inda, Linn.: Cetonia inda, Harr. Except the habit of feasting They will be a great assistance in seon our nicest peaches and such luscions. apples as the fall pippin, they do little harm. Then flight is heavy, and when on the wing they might easily be mistaken for bumble bees.- A. J. Cook.

Grape Julce for Bees. My bees are starving; there is nothing for o gather. I have been feeding almost starving; there is nothing for them to gather. I have been feeding sugar for some time. I mashed some grapes to feed my bees, and they liked them; will they injure the bees? Please answer in the Reg Jornayar. SAMUEL M. LILLEY. Montgomery Sta., Pa., Sept. 20, 1881.

[Grape juice will probably do no harm so long as bees are constantly brood in the hive it may cause disease. Hying, but they cannot winter on it.

Good Honey Crop. -- My bees did well. When I buy a queen I like to know this season. I have now about 3,000 lbs, of as mee honey for the market as can be purchased, in cans, boxes, seccan be purchased, in cans, hoxes, sections, etc. I think prices are looking up, and as I am not in need. I propose leaving my honey in the cellar for some time yet. I wish the BEE JOURNAL much success. J. ANDERSON.

Tiverton, Out., Sept. 16, 1881.

The Drouth Ended. The great drouth of 1881, has, at the advanced age of 110 days, found a "watery grave." There are no mourners, though the de-

ceased was much respected here.
W. H. Andrews.
McKinney, Tex., Sept. 13, 4801.

Milkweed, -1 inclose a specimen of plant the name of which I would like to know. It blossoms for about 75 days, and has a small red flower. The bres seem to prefer it to almost anything else, and work on it continually. 11. VARNER, Jordan, Minn., Sept. 12, 1881.

[This milkweed is one of the most common species of Asclepias. All the milkweeds are good honey-producers. True, the pollen masses sometimes entrap bees, and more frequently still worry them by adhering to their mouth. parts and legs; yet, from the abundant nectar which they yield, I think them desirable as forage plants for bees, -A. J. Cook.

A Ton of Honey from 55 Colonies.—I had 55 colonies left last spring, out of H7 last tall. They increased this summer by natural swarming to 95, and produced about 4200 lbs. of comb honey in sections, and about 800 lbs. of extracted, mostly basswood, honey is very promising, but the contimal heavy rains for the past 3 weeks, has stopped their work entirely. The whole country is in a perfect mire now.

C. Thelemann.

now. C. Theilmans. Theilmanton, Minn., Sept. 17, 1881.

The Michigan Bee Men. - This week's BEE JOURNAL contains notices of 18 conventions, of which Michigan has 6, or one-third of the entire number, and 3 more than any other state in the the best bee paper, but she cannot come up to glorious old Michigan for go-ahead bee-keepers.

Geo. Perry.
Lansing, Mich., Sept. 17, 1881.

Extract from the Sections.—Bees have done excellently well here this season. I cannot make my report yet, for the bees are still booming. I will have to report later in the season. When the bees quit work for the season, leaving boxes and sections partly tilled with honey, some being nearly ready to cap, what had I better do with Will it pay such sections and boxes? to squeeze the honey out and melt the comb into wax? J. R. BAKER, Keithsburg, Ill., Sept. 21, 1881.

I Extract the honey from the incomplete sections and boxes, and carefully save the combs for another season. eming a good yield.- ED.]

Good Increase. I bought 5 colonies bees which I have increased to 23. I had one colony of Italians that made 8 good colonies by dividing, and had I 8 good colonies by dividing, and had a matural swarm, which I united with another. I obtained no surplus honey, and am feeding 3 to give them stores for winter. My bees have reared no queens nor built combs; I bought them. I had the poorest success in-troducing queens that I ever had. I bought two queens in September and lost hath leaving our colony houselessly lost both leaving one colony hopelessly queenless, which I united with another; the other is rearing a queen, but I have a doubt whether she will get mated, as drones are getting scarce, Lam sorry somany queen-breeders are rearing such a variety of queens, for 10 cents, post paid.

what stock she is from. When the BEE JOURNAL comes to hand on Wednesday mornings. I know I have something reliable. ABE HOKI Union City, Ind., Sept. 11, 1881.

Light Crop.—Bees doing well as far as I can see.—There has been a rather light yield of honey this year, so far. I hope for better next year.

J. Elder.

Huntingdon, Ind., Sept. 23, 4881.

A Remarkable Oneen. -- On the 4th ult., I received from triend J. M. C. Taylor, of Lewistown, Md., 2 queens, one, of which, is an Albino, Both one, of which, is an Albino, Both were splendid specimens of the Italian race. One of these I lost, but the Albino excels in beauty, and is transcendently the most profific queen that I have known, in all my experience, which extends through lo years. Her progeny are rare beauties, and otterwind progenity and in the progenity are rare beauties. extraordinary active workers. I hand-led Italian Bees from the first importations, and these Albino bees are as amiable as any that I have known.

C. J. Romnson.

Richford, N. Z., Aug. 26, 1881,

Appoint Delegates.—The following circular has been sent to all the Michigan District Associations:

Lansing, Mich. Sept. 20, 4881.

Dear Siv: As your Association is soon to meet, please hear in mind that the State Association will meet at Battle Creek, Mich., Thursday, Dec. 8th, 1884, and see that delegates are appointed thereto—the more the better. We may well feel proud of the fact that we now have more District Associations in our State than does any ciations in our State than does any other State in the country, and if each one sends a strong delegation to the State meeting, it will insure a success eclipsing that of any previous meet-ing. That our State Society is a power, ing. That one state society is a power, is seen in the two laws secured at the last session of the legislature—foul brood and adulteration—which were secured through its influence. Let us all work carnestly to maintain all we have, and to achieve indefinitely more. Wishing you abundant success more. Wishing you adding an in success in your deliberations, we are very truly yours, A. J. Cook, Pres. T. F. BINGHAM, Abronia, Mich., Sec. Mich. S. B. K. A.

Kentneky Bee Keepers' Association.

The second annual convention of the Kentneky State Bee-Keepers' Association, will be held in the Exposition Building, in Louisville, Ky., on Wednesday and Thursday. Oct. 12 and 13, 1881.

A fine display of bee-keepers' supplies bonney etc. is expected, and

plies, honey, etc., is expected, and some of the most prominent bec-keepers in America, who will be in attendance at the National Bee-Keepers' Convention, at Lexington, Oct. 5, 6, and 7, are expected to attend. All are invited. N. P. Allers, Pres.

We have received from Ellwanger & Barry, proprietors of the " Mount Hope Nurseries." Rochester. N. Y., their descriptive catalogues of "fruits," and "select roses." These are elegantaly illustrated pamphlets, and are sent free upon application.

The St. Joseph. Mo., Gazette says: The St. Joseph, Mo., Gazette says:

-The Gazette proposes to keep pace with every movement that tends to the development of any great industry. It has had the pleasure of placing on its exchange list the the American Inc. Journal, which is to say, that henceforth the aparist, as well as every body else, will find honey to his own liking in the great daily of the Northwest but never "tafly."

Badges. - Bee-keepers going to fairs should wear a badge with a gold bee on it. It will serve to introduce him to other bee men. We will send them

### Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

😭 Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the old as well as the new address.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Faded or Gray Hair gradually recovers its youthful color and lustre by the use of Parker's Hair Balsam, an elegant dressing, admired for its purity and the base true. ity and rich perfume.

There is More Strength restoring power in a 50 cent bottle of Parker's Ginger Tonic than in a bushel of malt or a gallon of milk. As an appetizer, blood purifier and kidney corrector, there is nothing like it, and invalids find it a wonderful invigorant for mind and body. See other column. 36wit

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a chib can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Dafe following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Boes and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the JOURNAL for a year free. It will pay to devote a few hours to the BEE JOURNAL.

It would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office. County or State.—Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list.

Premiums.—Those who get up clubs or the Weekly BEE JOURNAL for for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums:

For a Club of 2.—a copy of "Bees and Honey."

3.—an Emerson Binder for 1882,

4.—l'ook's (Bee) Manual, paper.

5.—" "cloth.

6.—Weekly Bee Journal for 1 year.

WE We have a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to dis-tribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, A Monday, 10 n. m., Sept. 26, 4881.

The following are the latest quotations for honey and beeswax received up to this hour:

#### CHICAGO,

HONEY-The market is lively and prices stendy. Thive just purchased a car load of extracted at current prices. We quote light comb honey, in single comb boxes, 18-20c; in larger boxes 2c, less. Extracted

BEESWAX Prime quality, 185/22c At. H. NEWMAN, 972 W. Madison St.

#### CLEVELAND

HONEY-There is a slight improvement in our market for comb honey. One pound implassed sections find ready sale at 21c for white, and 1% 20c, to 21b, sections—Extracted honey continues slow at 10c/2c. now at 1966(22). BEESWAX - 206/22). A. C. KENDEL, 115 Ontario Street.

#### NEW YORK.

HONEY-The market is well supplied at present, but there is a large prospective demand.
We quote as follows: White comb, in small baxes, 18-20c; dark, in small baxes, 15-20c; dark, in small baxes, 15-20c; dec.
BEESWAX.-Prime quality, 25-26-24c.
THORN & CO., 11 and 13 Devoc avenue.

#### CINCINNATI.

HONEY—Is in good demand here now.
1 quote: Good comb horney, in sections, is worth
4 detection arrival. Extracted, 70-ye, on arrival.
BEESWAX.—18622c., on arrival. I have paid
5c, per lb. for choice lots.

C. F. MITH.

#### BOSTON.

HONEY.—Our honey trade has now harry com-menced, and we are selling quite freely. We find that one-pound combs are a very desirable pack-age in our market, and a large quantity could be sold at 30622c, according to quality. BEESWAX—Prime quality, 25c, CROCKER & BLAKE, 57 Chatham Street.

#### BALTIMORE.

HONEY.-But little on the market, and prices are not quoted.
BEESWAX.-Southern, pure, 21a 22a; Western, pure, 21a 22c; grease wax, 11c.-Baltimore Market, Juneau.

#### -INDIANA POLIS.

HONEY.—New, in 1 or 2 lb. sections, 22@25c.-Indianapolis Stack Remew.

#### SAN FRANCISCO.

HONEY.—Sales of choice comb, to arrive, have been effected at 20c. for small lots. It is doubtful if an order for a large lot of choice comb could be tilled in this market. Choice extracted, in barrels, is quotable at 10045/2c. We quote white comb, 1000 20c.; dark to go. d, 1000 14c. Extracted, choice to extra white, 100410/2c.; dark and candied, 8c. BEESWAX—230042c.; STEARNS & SMITH, 425 Front Street.

### ST. LOUIS.

HONEY .- Demand fair. New extracted, 7690c. omb, 140-16e.
BEESWAX Prime yellow sells at 200-21c.
R. C. GREER & Co., 117 N. Main Street.

### PHILADELPHIA.

HONEY.-The supply and demand are alike nominal.

BEESWAX - Best light 235 25c. Philadelphia Merchants' Guide.

### Local Convention Directory.

Time and Place of Meeting.

Sept.29-Southwestern Iowa, near Corning, Iowa. W. J. Oliver, Sec.

Oct. 4—Eastern Michigan, at Dotroit, Mich.
A. B. Weed, Sec., Detroit, Mich.
5—Southeastern Mich., at Ann Arbor, Mich.

## The Bee-Keeper's Guide;

MANUAL OF THE APLARY.

By A. J. COOK, tif Lausing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Blustentions.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and eleganty distrated. The first edition of 5,000 copies was exhausted in about 18 months a sale unprecedented in the annals of beesculture. This new work has been produced with great care, patient, study and persistent research. It comprises a full defineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings the products of the Honey Bee; the races of bees; full descriptions of honey producing plants, trees, shrulus, etc., splendidy illustrated—and last, though

not least, detailed instructions for the various manipulations necessary in the aparty. This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the andarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—L'Apiculture, Paris.

I think Cook's Manual is the best of our American works.-Lewis T, Colby.

. It appears to have cut the ground from under future book-makers.  $-British\ Bee\ Journal$ .

Prof. Cook's valuable Mannal has been my constant guide in my operations and successful man nagement of the spary.—J.P. WEST.

I have derived more practical knowledge from Prof. Cook's New Manual of the Aparry than from any other book.—E. H. Wynktou.

my order to on.—r., It. W.YAKUUP.
This book is just what everyone interested in dees ought to have, and which, no one who obtains t, will ever regret having purchased.—Mich, Far.

it, will ever regret having purchased.—Mich, Far, Is a masterly production, and one that no beckeeper, however united his means, can allord to do without.—Nebraska Farmer.

To all who wish to engage in bee culture, a manual is a necessity. Prof. Cook's Manual is an extiaustive work.—Herald, Monnecllo, Ill.

With Cook's Manual I am more than pleased. It is tully up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—WM. VAN ANTWERC, M. D.

It is the latest book on the beer, and treats of both

ual.—WM, VAN ANTWERC, M. D.
It is the latest book on the bee, and treats of both
the bee and hives, with their implements. It is of
value to all bee-russers. - Ky, Live Stock Record.
It is a credit to the author as well the publisher,
I have never yet met with a work, other French
or foreign, which I have so much. L'Abbie Du
Bots, editor of the Bulletin D'Apiculteur, France,
I not only gives the matural bistory of these.

or rogery, when I has so much. I ABBR 1908, editor of the Bulletin Ir ABBR 1908, editor of the Bulletin Ir ABBR 1908. It not only gives the natural history of these instrtious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botamical description of honey producing plants, and an extended account of the enemies of bees. Pomocrat, Pulaski, N. V.

We have perused with great pleasure this vade mecanic of the bee-keeper. It is replete with the best information on everything belonging to appear the enemies of the bee-keeper. It is replete with the best information on everything belonging to appear the enemies of the best information on everything belonging to appear the enemies of the ene

essential to every anateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—Western Agriculturist.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published by the most complete manual for the instruction of bee-keepers which has ever been published by the most at till explaination by There is no subject relating or fine of the early and in the complation of the work Prof. Cook has had the advantage of all the previous knowlede of aparists, which he uses admirably to promote and unlike popular furs most interesting of all occupations. American Inventor. It may safely be pronounced the most complete and comprehensive of the several mannals which have recently appeared on the subject of bees and their handling in aparies. The studies of the structure of the bees the discrete varieties, the pronounced of manuacement, extending to the somilest details, are all of high and practical value. Prof. Cook has presented the literature by homes of manuacement, extending to the somilest details, are all of high and practical value. Prof. Cook has presented the latest phaseout progressive boe-keeping, and writes of the Bennes discussed in the light of his own experience.—Parine Rural.

Of the many excellent works which we have examined on bee-culture, we consider Prof. Cook's the most valuable for the study of these who contemplate going into the husiness or are already keeping bees. It thoroughly studied, and its tenchings conformed to, by the apinits, who exercises a reasonable degree of commonsense, he or she cannot the first of the study of these who contemplate degree of commonsense, he or she cannot work with a degree of commonsense, he or she cannot be all the profession and the lates the cook's Manual of the Appary holds in America the same high rails, that is accorded in the fermion to the same for the same that for the same that the cook's Manual of the Appary holds in America the same halp has a fermion of the same and th

the reader with him to the end. Konsas Farmer.

Cook's Mannal of the Appary helds in America
the same high rank, that is accorded in Germany
to the book of which Dalerzon is the author; the
only difference being that Prot. Cook's Mannal
combines the profoundness of the German postor
with the superiority of the practical American.
He reters in several instances to Darwin; and
does not belong to that class which lates everything that is foreign, for he speaks of German natturalists with great reverence. German Freidenker,
Milwaukee, Wis.

## POPULAR HONEY KEGS

Small Keys for Honey,

These kegs answer the popular demand for honey in small packages, and when compared with large barrels holding from 300 to 500 lbs, each, they are fully as cheap and often cheaper. They need no waxing but should simply be thoroughly scalled with boiling water before using. The leakage so often occurring in the large hard-wood barrels can be entirely prevented by using the White Pine Kegs. Considering the cost and trouble of waxing, the loss of honey by leakage, and the ease with which these kegs can be handled and shipped, with an actual saving in original cost, it must be apparent to all that they are the best. These kegs answer the popular demand

Entered at Chicago post office as second class matter.

### The Honey Crop for 1881.

In the BEE JOURNAL of September 14th, we requested the bee-keepers of America to send us an abbreviated report of the result of the season's operations, and for the past week the postman who delivers our mail matter has been sorely puzzled as to "what has broken loose among bee-keepers!" to increase our daily receipts of postal cards by hundreds. We must embrace this occasion, while thanking our friends for the promptness with which they have responded to our request, to congratulate them upon the exceedingly favorable report which they have presented.

We had hoped to be able to give the report in this issue, but over-rated our ability to properly collate it in time, and must content ourselves by briefly summarizing. Our returns are from more than 100,000 colonies at the commencement of the season, the majority of which were in bad condition for a vigorous campaign, and had to be put in shape after the harvest commenced. The average yield per colony in the spring we find to be over 75 pounds of surplus. The honey is of most excellent quality, in fact much above the average, and has found very ready sale so far as we can learn, at remunerative prices.

The increase reported amounts to

bees in good to extra good condition with plenty of bees and the choicest of stores. Several of those who have reported were largely engaged in queen-rearing, for which there was a brisk sale; so that, although their crop reports are not so large as they might have been, their receipts have not been

We have received no reports from California, but at this writing they are still coming in from all other points, and in our next issue we will be able to give an elaborate report. Enough, however, is now known to justify our wildest anticipations last spring. The reports in some cases are almost fabulous. Those who lost bees last winter could attribute it to misfortune: those who have failed to retrieve their losses, can blame only themselves—we advised them in time.

It is especially pleasing to be able to congratulate our readers on their generous returns, in view of the partial failure of nearly all other rural pursuits; and it but confirms us in asserting that apiculture is as little liable to disaster as any other pursuit, that misfortunes are more easily retrieved, and that the percentage of profit is very much greater as compared with the capital and labor invested.

Mrs. L. Harrison, of Peoria, Ill., has kindly sent us a copy of The Great West, and calls attention to the following item:

Bees have done unusually well in Bees have done unusually well in Colorado this year. First class native honey can be had for 25 cents per pound. The dry atmosphere and the great amount of flowers in Colorado, make this a profitable State for beekeepers, and we wonder that more people do not engage in bee-culture and the production of honey. One hundred pounds of honey brings about \$20 in the market—equal to an acre of \$20 in the market—equal to an acre of wheat, ordinary seasons.

Undoubtedly Colorado has a promising future before it as a honey-producing State, and a few such seasons as this has been, will work wonders in developing it.

Transplanting Trees. - The Mich igan Farmer makes the following very timely remarks on this subject:

Among all the forest trees recom-Among an the forest trees recommended for transplanting to our prairies, there are none so valuable to the bee-keepers as the linden. It forms not only a beautiful shade, but its rich perfunied blossoms yield to the bees, a large quantity of excellent honey. The tree hears transplanting well and The free bears transplanting well and The increase reported amounts to over 65 per cent., and all report their overlooked in making a selection.

### Attractive Packages for Honey.

As our readers know, the BEE Jour-NAL has always been very outspoken in impressing upon apparists the necessity of employing the most approved and attractive packages in preparing their honey for the market. Not only will it find a more ready sale, but generally at figures in excess of market rates. To make our frequent allusions to this subject more impressive, we make the following extract frem a private letter dated Boston, Sept. 23, written by Mr. Frank L. Ripley, of Crocker & Blake, commission and wholesale dealers:

Our market, more than any other. demands the most improved style of packages and crates. We are selling Salisbury's honey, of Geddes, N. Y., who uses a crate 14x6, with glass on the crate but none on the honey, 24 combs, weight from 20 to 23 pounds. It is one of the most salidle packages combs, weight from 20 to 23 pounds. It is one of the most salable packages we ever had. Honey will sell twice as quick in a desirable package. I am intending to go down in Maine and work up the honey-raising. They have the finest of honey, but in 10 to 15 lb, packages, just as the bees happen to make in a frame they whitteen Van make, in a frame they whittle out Yan-kee style. While I glory in being a Yankee, I think there are some things to be learned yet.

To further illustrate—in conversation recently with our son (A.H.N.) a honey dealer in Chicago, our attention was called to some beautiful honey in single comb boxes, which he said retailed readily at 30c. in the grocery stores, while some two-comb boxes (4 lbs., and slightly crooked), from the same producer, of the same quality and collected at the same time, would not retail at more than 23 to 25c., and would "drag at that." He also called attention to the fact that he found it necessary to repack much of his extracted honey from the barrels into 5, 10 and 15 gallon kegs, in order to meet the requirements of the market. "Of course," said he, "the cost of the new packages and the time consumed in repacking amounts to quite a little percentage, but I can make my sales much more readily, and therein lies the profit derived from any business." He said he thought another season he might be obliged to discriminate in prices, in buying extracted honey for the market, in favor of the kegs.

It must be apparent to every reflecting bee-keeper, that if a discrimination is made, and if it pays the city jobber to repack into the neat, convenient, salable kegs, it will pay him to use none other, and thereby not only effect none other, and thereby not only effect a quicker sale and realize a stiffer G. M. Doolittle is very sick with maprice, but also save the cost of the larial fever.

barrel, which he otherwise throws away.

Since the above was put in type, we have received the following letter bearing upon the same subject, dated September 23, from Messrs, Stearns & Smith, who have for years furnished reliable San Francisco honey quotations for the BEE JOURNAL:

In the Cincinnati market report, in your issue of Sept. 7, 1881, C. F. Muth says that he "paid King Cramer, for a lot of about 2,000 lbs. of comb honey, 17 cents per pound, and every comb perfect and in the Muth section, which speaks well for the producer," etc.; we can beat it. A. W. Hale, of San speaks well for the producer," etc.; we can beat it. A. W. Hale, of San Bernardino county, shipped us 83 cases (about 5,000 lbs.) of comb honey, in Harbison sections, which was straight and fine. We have rendered him sales at 20 cents per pound for part of it, and will sell the remainder at the same figure. We believe that figure speaks better for the producer, as up to this lot there had been no sales at over 16 cents. cents.

It not only speaks well for the shipper, but volumes for the house which takes an emulative pride in getting the highest prices for its patrons. If bee-keepers will employ their better talents in studying the wants of the market, then exercise their nicest skill in putting it up, there will be no need of centralizing their shipments in one or two commission houses, but, rather, plenty of respectable and responsible firms will not only solicit our consignments, but will prove themselves quite worthy of our confidence.

In order to avoid misunderstanding, we will now inform our readers that our next issue may be two or three days late, in consequence of our attendance at the National Convention: but we trust it will possess sufficient additional interest to compensate for any annoyance from irregularity.

The Bee Journal in Canada.-The Essex  $Chronicl\epsilon$  remarks as follows:

We have before us the Weekly Bee Journal, which is devoted to the interests of scientific bee culture, and the production and sale of pure honey, and we must confess that we are highly pleased with it. It contains many thoughtfully written editorials and letters on bee culture; is remark-ably liberal in dealing with the views of those who differ from it, and is a reliable authority on this subject. We, with others of this country, have subject. studied considerably this pleasing and classic branch of industry, and can fully appreciate such a journal as we have before us.

### Live Oak Honey-Dew.

From Mr. E. P. Massey, of Waco. Texas, we have received several twigs of live oak, bearing leaves, acorns and balls, and accompanied with the following letter:

I send for your inspection, two or three small branches of the live oak, containing leaves, balls and acorns. In the fall after rains set in, the green halls are covered with drops of honey dew, and in some cases the drops run together and drop off the ball. The bees gather large quantities of honey from these oaks, commencing in the morning before I can see a bee three feet from my nose, and this honey-dew continues until long after it gets too cold for bees to fly out. You will find two dry balls of last year's growth. Now, if this honey-dew is put there by an insect, as some claim, why not scatter it all over dry balls, acorns, leaves and limbs? And why is it, that we cannot see these insects? No: the honey exudes from the green balls in drops just perceptible up to drops too large for one bee to carry off at one load.

I have on my lot three of these oaks under the largest one is my apiary and this tree shades about thirty-five feet of ground when the sun is at high meridian, and I have watched this thing for the eight years that I have been keeping bees. I would like to

been keeping bees. I would like to have your opinion on the subject. We have had a poor honey season, owing to a thirteen weeks' dronth, yet the hives are all full of honey, and my bees will be in splendid fix for winter, after leaving our table supplied for the winter.

For many years the impression prevailed among naturalists that honeydew was the excretion of Aphides (small insects) on the leaves of trees and plants, and that bees gathered and stored it in times of great scarcity of nectar secretion in the plants; but in later years it has been pretty definitely settled that honey-dew is mostly an exudation of sap or juice through the pores of the leaves and plants, and it is probably composed of the same chemical properties possessed by the nectar which is gathered by the bees from the corollas of flowers. Prof. Cook, in a letter written in December last, definitely settles the question that honey-dew is exuded from plants. He says: "Mr. Trelease has not only tasted the nectar secreted by the plant, but he has discovered the glands which secrete the nectar. These are often so large as to be easily recognized by the unaided vision. Mr. Trelease showed me the glands on species of cassia, acassia, pasiflorathe May-pop of Alabama-prunes, and the cotton plant. On a fine acassia growing in the botanical laboratory of the University, I not only saw the gland, but also the drop of nectar, which I found sweet to the taste." There are also insects which leave a liquid secretion on the leaves which may be gathered by the bees under the same conditions that they would take glucose or any other obnoxious substances: but these conditions occur so seldom that it is not often that this species of honey-dew is encountered.

In noticing the Rural Canadian, on page 298, we called it a monthly, having found nothing, on looking it over, to indicate bow often it was to be issued. We now learn from itsedi-

### The Sense of Color in Bees.

The following article is taken from the London, England, Standard, of Sept. 8, 1881. It is an editorial criticism on the recent experiments of Sir John Lubbock on the possession of the sense of color by bees. Our readwill peruse it with interest:

Sir John Lubbock has been again experimenting upon bees. The especial object of his investigations has been to ascertain how far the bee pos-sesses the sense of color. He has made use of slips of colored glass, to which the bees have been attracted by drops of honey sprinkled upon them. There are two conditions likely to influence are two conditions likely to influence the flight of a bee in pursuit of food. It may be attracted to a flower by its color, or by its odor. It may, in other words, either see the flower or else scent it or smell it.

Some flowers have a powerful odor;

others nave a powerful odor; others are exquisitely colored. But, according to the reasoning of Sir John Lubbock, bees are unable to distinguish between the odor of one flower and that of another. They seem in each the peculiar fragrance of honey. In their ultimate choice, how-ever, they are determined by the sense of color. Sir John, accordingly, provided himself for his experiments with various pieces of colored glass, green, orange, red, white and yellow. It would seem, indeed, that the resources of the prism were exhausted. An exact account was taken of the number of bees that visited each piece number of bees that visited each piece of glass on which a drop of honey was placed as a lure, and it is Sir John Lubbock's opinion that bees are, in a rough kind of way, sensitive to color, and that their favorite color is blue. The statistics which lead him to this conditions of the statistics which lead him to this conditions.

The statistics which lead him to this conclusion we need not analyse.

When an experienced Naturalist assures us that he has arrived at a definite result, it is not safe to dispute his conclusions. Bees, it would now seem, have a special partiality for blue although we may remark, in passing, the color is uncommon in the vegeta-ble kingdom. We may expect that they will attach themselves to Canterbury bells, to borage, or, indeed, to any flower the petals of which are of any nower the petans of which are of a cerulean tinge. Such is the con-clusion at which Sir John Lubbock has arrived. Those who have watched the habits of bees will be probably otherwise minded. It is not a safe test to lay down a number of slips of test to lay down a number of slips of colored glass, with a drop of honey upon each, and to count the number of visits made by itinerant bees to each slip. There may be draughts or currents of wind in the way; or the honey upon one particular slip may be thicker than it is upon the next, and may smell sweeter, and shoot its odor further and may smell sweeter, and shoot its odor further and may smell sweeter. further, and may so attract more bees. It is, indeed, always difficult to de-

termine how far observations of this kind are to be absolutely accepted. In the present instance Sir John Lub-bock finds that his blue slips of glass were visited by a larger number of bees than were the slips of other colors, and from this he draws his general inferences. But if any stu-dent of natural history will take the trouble to walk in his garden in the morning and to take especial notice of his borage, his Canterbury bells, and his mignonette, he will find the bees swarming upon the mignonette, while they neglect the borage and the Can-

they neglect the borage and the vanterbury bells.

We might, indeed, test Sir John Lubbock's conclusions by a very simple experiment. If bees prefer blue to any other color, they will then prefer a clump of forget-me-not to a chann of mignonette. Let any man clump of mignonette. Let any man grow in his garden side by side a small

tice which of the two clumps is most human race. equally balanced a bee prefers blue to any other colors.

Mr. Darwin, in his memorable book on the "Origin of Species," has left on the "Origin of Species," has left on record some remarks on the sense of color, to which subsequent investi-gations have added nothing. He tells us, among other things, that within his own knowledge, from facts re-ported to him by a good observer, sus-ceptibility in cattle to the attacks of flies has a connection with their color, as is also the liability to be poisoned by particular plants.

Any one who is familiar with horses will know at once that, according to the current of tradition, there are certain colors in horses which denote peculiar characteristics. A strawpeculiar characteristics. A straw-berry roan or a flea-bitten gray will be strong and hardy. A chestnut will be courageous and mettlesome, but also delicate, and a chestnut with a white blaze and white stockings will be ex-ceptionally liable to slight attacks of ill-health. It is also an ascertained fact that domestication strangely affects the color of animals. There is no wild animal which is pie-bald. But when domestication has followed through, many generations the piethrough many generations the piebald color usually supervenes. Horses rabbits, and guinea pigs are apt to be piebald. So, too, with mice and rats. Pigeons are of every possible color. Canaries range from a deep green cinnamon, which is almost black, to a yellow so pale that it is nearly white.

Nothing is stranger than the variety of color to be found in deer in an enclosed park. Some will be absolutely black; others will be dappled and spotted; others, again, will be almost white. And it is worth noticing that, while domestication tends to produce irregular color, or what is commonly called piebaldism, natural develop-ment produces color equally brilliant, but more distinctly and certainly dis-tributed. The distribution of tints tributed. The distribution of this upon a guinea-pig or a piebald horse is absolutely uncertain. But the arrangement of colors upon a macaw, or a parrot, or a kinglisher is absolutely

certain.

Why nature should thus compete with civilization it is impossible to conjecture. According to Mr. Darwin, shells at their southern limit, and when living in shallow water, vary and become more brightly colored than those of the same species token from general water with it. colored than those of the same species taken from greater depths, or in latitudes further distant from the equator. Then there are certain colors peculiar to the London sparrow, and to the English cockle, mussel, and welk. On the other hand, there are hues and iridescences peculiar to the birds and to the shells of tropical climates. No one can account for these mates. No one can account for these characteristics. A volume might be written upon the colors of butterflies, flowers, insects, birds and fish, and the more that was written upon the subject, the less we should probably know about it.

Meantime, it is certain that the laws and conditions of color in nature are and conditions of color in nature are but imperfectly understood. For in-stance, there has never yet been pro-duced such a marval as a blue rose, although every gardener in Europe has been attempting for year upon year to grow one. And, whatever may be the conclusion of zoologists, we have before as the matire existing have before us the entire question we have before us the entire question of the productive influence of color in animal and vegetable life. Nature may attract bees to blue flowers, or may dress the kinglisher in every known color, or may throw the prism upon the neck of the turtle dove, or may dapple the fallow deer. We cannot tell how these tints and lines and markings are procured. It is enough for us to know that they exist.

It would nerhans be interesting if

It would, perhaps, be interesting if Sir John Lubbock, leaving for awhile tor that it is to be published semi-patch of forget-me-not and a small monthly, and we cheerfully correct it. patch of mignonette, and let him no-his views on the sense of color in the for 10 cents, post paid.

The subject is, for many frequented by bees. There can be little doubt as to the conclusion at which he will arrive. And the observations which Sir John Lubbock has made prove nothing more than that when all other considerations are of color, which stands him in good carryly belonged a keep profess that the course of infinite generations he has developed a certain definite sense of color, which stands him in good

stead.

It is a singular thing that for some years past we have painted our houses and bed-rooms, and lobbies and halls, and bed-rooms, and lobbies and halls, in a sober and almost penitential tint. The Greeks, whose villas are left in the South of Italy; the Romans, who made Pompeii their Brighton and Herculaneum its Kemp Town; and the Egyptians, from whom Rome, there can be little doubt, adopted their schemes of color in domestic architecture, were all given to strong effects.

Modern taste is more subdued.

rejoice in quiet hues and delicate tints. It would be curious to ascertain whether perception of color fol-lows any definite rule. It would seem, according to Sir John Lubbock, that according to Sir John Lubbock, that the sense of color in insects is but imperfectly developed. In animals and birds it becomes stronger. Amongst uncivilized races it assumes the form of a desire for bright tints and marked contrasts. It now has begun to assume an entirely new course, and to seek dim colors and quiet symphonies. One thing, at any rate, is certain, that the sense of color has played a most important part in the development of the human race, and that its subtleties remain as incomprehensible as those of the musical scale. those of the musical scale.

#### Colorado Bee and Honey Show.—The Colorado Farmer says:

Though there were but four or five exhibits of honey, still the fact was plain that this industry is becoming a distinct feature of farm and garden in Colorado. From all accounts, the present year has been a remarkably good one for the products of the apiary. A. L. Peabody had on the grounds a hive which showed the bees grounds a live which showed the bees at work. Mr. James informed us that from one hive this season he had taken 120 lbs. of the best honey, from which he realized \$30. There is no reason in the world why honey by the car load should be shipped into Colorado from California and Kansas, when the evidence of profit on bee-culture is made so clear by such a statement. In pu-rity and sweetness, our home produce rity and sweetness, our home produce equals, if it is not even superior to what comes to us from elsewhere. These facts ought to set many to thinking, and from thinking to acting, until instead of perhaps, 5,000 being in the State, 500,000 should be scattered in the valleys and foothills, and honey be so abundant as to be an article for export, and adding largely to the material wealth of the State.

Seasonable Hints.—The Indiana Farmer gives the following caution and

advice:

In almost all cases there is an easy remedy for any trouble with the bees, if ascertained this month. If a colony has not sufficient stores, it may now be fed; while, if you wait until later, there is trouble in so doing. Feeding at this season of the year should always be done with caution. For, although bees are not so much disposed to rob now, as early in the spring, yet, if a colony be left unguarded, so as to give the robbers a chance, they will clean it out on very short notice. Promptness is the spice of successful bee-keeping. Should you discover that anything is wrong with them, make an examination at once, and apply the remedy. Do not wait and ply the remedy. Do not wait and think you will fix them some other time, but do it at once.

Badges. —Bee-keepers going to fairs should wear a badge with a gold bee on it. It will serve to introduce him to other bee men. We will send them

For the American Bee Journal.

#### Ten-Dollar Award for Best Queen.

COMMITTEE'S REPORT.

We, the undersigned, committee to award the prize of SHoffered by Rev. E. L. Briggs, of this place, for the best queen bee, by virtue of and under the conditions by him offered on page 251, AMERICAN BEE JOURNAL for August 15, 1812, beer leave to submit the fall. 10, 1881, beg leave to submit the following as our report thereon

Before reporting our ratings thereon, it is due both to Mr. Briggs, ourselves and the parties forwarding queens, to state that Mr. B. never informed the committee of whom he had received a queen until after the award was made award was made.

Using 100 points as the standard for each of the four qualifications, the following is the total number of points awarded the respective queens, each member of the committee making his own ratings independent of and with-out the knowledge of either of the

other members:

We therefore award to Dr. 1. P. Wilson the \$10 prize, and state that she was without doubt the finest queen in was without doubt the finest queen in every respect we ever saw. Had there been a second prize to award, the above ratings show that the contest would have been very close between Messrs. Henderson and Lossing. The committee were surprised at the size, beauty and disposition of all the queens entered, and extremely gratified at the very choice americance of fied at the very choice appearance of every colony in Mr. Briggs' apiary, every colony in Mr. Briggs' apiary, and the evidence everywhere exhibited of a perfect knowledge of the bees and

business throughout his apiary.

### For the American Bee Journal. The Disposal of Honey.

JAMES HEDDON.

Producers at large have but little knowledge of the fixed laws of commerce; still less of those which fluc-tuate, among the most important of which is the responsibility of the party to whom we trust our goods either upon 5, 10 or 30 days' credit, or on commission. If a worthless and unprincipled man gets the idea into his head that he will be dishonest, he generally alights upon the producing class, knowing that they have less opportunities to become acquainted with his scheme and himself, than any other set of men. There exists a strong de-termination in this world, that less than one-half of mankind shall do the work for all, and pretty successfully is this determination carried out, in a lawful and "business" like manner, or unlawful way. Somebody rents a small corner room on some commission street, and perhaps without capi-tal enough to pay that rent more than a month, or a quarter at most in advance, and solicits your consignments. vance, and solicits your consignments. By some pretending circular, he gets in thousands of dollars' worth of goods, and after selling them out bids the business and consignees an affectionate adieu; or, perhaps, "breaks down," with a fine brick house exempt from his creditors. In times like these when money is plentier, such transac-

is good. I mean by good, that I can force a collection for any just claim. I have just read the able article of Mr. Geo. W. House, upon centralizing the trade, published in the Bee Journal and honest purposes are not inherent to a few firms alone in the United States nor our their homests. trade, published in the BEE JOURNAL of Sept. 14, page 291, also the editor's comments thereon. Truly, the subject is a great one, and of vast importance to producers. I believe I agree with Mr. House in regard to centralizing the product on our markets, where placed by us to be sold on commission, but with the editor as regards buyers. "Supply and demand" make buyers. "Supply and demand make ups and downs in prices. I would like to see the number of buyers large, and their demands great. I know of no better way to increase buyers than to cut down the number of commission Buyers are opposed to us; com mission men are our agents, and it our honey was to-day all in the hands of one bee-keeper, he would have a "corner" on honey. If in the hands of eight or ten, they would have, or could make a corner on the honey crop, if they could agree so to do. Our agents can do the same. Buyers are "bears," for it is to their interest to "bears," for it is to their interest to depress the wholesale price of honey. Commission men are the "bulls," for they are working for our interests, and hold up the prices to the best of their ability. I believe it is to my interest not to

have your honey, reader, in opposition to mine to any greater degree than I can avoid. I feel sure that it opposes mine less in the same store than it would in amother across the way. This is an the interest I have in the motter. is all the interest I have in the matter, you have the same. I do not suppose that all bee-keepers are going to ship to one firm, but I speak of this for the purpose of illustrating the point as ta-ken by Mr. House and followed by me. I think the different names presented by him are well chosen firms, and I have full faith that this selection is made from his best understanding, and without the knowledge of the par-

In regard to selling out-and-out, as in comparison with placing on commission, each has its advantages; the out-and-out sale system some very inportant ones; but as yet comb honey will no doubt bring more money to us put into the hands of the retailer through the commission house, than direct from us in most cases. Extracted honey is more of a staple, with I have had by far better success selling out-and-out than by placing on commission. That the same condition of things may become true of comb honey I really hope, but I am of the opinion it has not averaged. it has not arrived. I was surprised at learning from Mr. A. H. Newman the extent of his sales, and the various uses for extracted honey. These facts, together with my late impressions of the slow increase (or, rather, late de-crease) of colonies, and small surplus yields, remove all fears of over-stocking the market, for a time at least.
Dowagiae, Mich., Sept. 17, 1881.

[One great objection to attempt ing the proposed centralization plan is its impracticability, and that it is impracticable Mr. Heddon virtually admits when he says, "I do not suppose that all bee-keepers are going to ship to one firm." Nor will all, or even the majority, be willing or able to see the peculiar advantages possessed by one commission house for disposing of their honey over others equally as responsible, quite as well known, just as favorably situated, and who would work as faithfully for the interests of those making consignments to them to be disposed of. We do not think we over-rate Mr. Heddon's business tact, when we assume that he would

States, nor can they, however wellintending, expect to reverse the natural laws of trade. Many producers will shin to whom and where they may think to their best interests, regardless of the light in which some, or even the majority, may view it.- Eb.]

For the American Bee Journal. Improvement in Bees-Albinos, etc.

S. VALENTINE.

For 35 years 1 have given more or less attention to the care, culture and breeding of bees. About 6 years ago I procured the very best imported and home-bred Italians, and determined to breed for a high standard of purity, and after careful, frequent and repeated experiments. I find that the rrest Italian bees run or develop into albinos, and my acquaintances who follow my method have the same experience.

Now, why is this result? It may be Now, why is this result? It may be partly owing to American climatic influences and breeding, but if we go back to the imported we find there a vast difference, and if we closely examine the best stocks, we see the white and corresponding colors cropping out in some of their progeny, and by breeding for improvement, we find as the good qualities are brought out the corresponding colors also develor. Now responding colors also develop. Now, is this climatic influence and breeding is this climatic inducence and breeding the cause, or is the imported Italian a cross from some other? I am of the opinion that the Italian is not a pure race, but that it has been produced by some amalgamation; I am also of the opinion that there was somewhere in the past a pure bee with white bands somewhat resembling the so-called albino, and from climatic influences and the method of breeding which I have practiced, I believe we have produced a bee that approximates that pure bee which may have existed in the past, if not now. Their kindness in handling. not now. Their kindness in handling, and being a larger bee, carrying larger loads, together with their quality as honey gatherers, leads me to prefer them to the Italian.

I have procured and experimented with nearly all the imported bees, including the Syrians, as well as other varieties that have been extolled for varieties that have been extoned to their qualities, yet, after all, I must affirm that for all practical purposes, for beauty, for kindness, for longevity of life, and for the quantity of honey they gather, I find none superior to the albino bee, nor even in all respects

In the August number of Gleanings, page 409, under the caption "Albino Bees,"etc., the editor makes use of the

following language

"When the friends have anything they would like me to see and report on, I shall be most happy to receive it. will report to the best of my and will report to the best of my ability; but the fact of my having re-ceived a nice present, I hope will in no way influence me in reporting for the benefit of the public. Friend Valen-tine has very kindly sent me a nice nucleus of his so-called albino bees. With his letter advising us of their shipment, comes his circular, from which we extract the following," etc.

Now this language intimates that he no present.

Respecting his comments upon the tions are not so numerous.

I have never lost a cent yet, but I have used caution. I have witnessed the losses of quite a number of beekeepers, as well as other business men.

I feel that I want to know that the party I trust my money or goods with

tinctly white that any ordinary eye can distinguish them, as I have frequently seen visitors to my apiary, who are not even amateurs in bee-culture, call attention to.

In my circular I dwelt most particularly on the color by way of description that these features are characteristic of this variety. I did not argue that the color affected the quality of the bee, as he intimated by saying that hens are not any better layers because they were selected from white-feathcred ones out of a flock of many colors. The white-feathered hen may or may of he white-feathered hen may or may not be a better layer, but if so, no one would for a moment suppose that the white feathers made the particular difference. The quality of the hen is the character of her laying, but the color of her feathers is the natural appearance. on her reathers is the natural appearance by which any one would naturally describe the hen. For all we know upon the subject, the white bands do not condition the good qualities of the albino hee, neither does the color condition the good qualities of any other variety is received. variety or species; but they do serve as a natural feature by which the variety may be described.

I cannot understand why any one

will disparage the albino bee, or our bright American Italians, for the imported, unless it is for the greater profit they may derive from the sale of im-ported queens; surely, it cannot be for their superior qualities as honey gath-erers. I have thoroughly tested this for myself, and find that this is also the experience of my acquaintances who have given attention to bee-culture. Double Pipe Creek, Md.

From the New York Tribune,

Bees, Glucose and Honey Comb.

PROF. A. J. COOK.

The following, from an article published in the *Popular Science Monthly*, and written by Harvey W. Wiley, shows what awkward work a man may make when he attempts to write about that of which he knows nothing. The misstatements are mischievous, and, as they have been widely copied,

deserve correcting:

"Bees eat glucose with the greatest avidity, or, rather, they act as funnels by which the glucose is poured into the comb. For it is quite true that honey made by bees which have free honey made by bees which have free access to glucose, differs scarcely at all from the glucose itself. But the quantity of honey which a bee will store away when fed on glucose, is truly wonderful. This gluttony, however, rapidly undermines the apiarian constitution, and the bee rarely lives to enjoy the fruits of its apparent good fortune. In commercial honey, which is entirely free from bee mediation, the comb is made of paraffine, and filled with pure glucose by apand filled with pure glucose by ap-propriate machinery. The honey, for whiteness and beauty rivals the celebrated real white clover honey of Ver-

mont, but can be sold at an immense profit at ½ the price."

1. Bees do not eat glucose with the greatest avidity. True, they will take it when they can get nothing better, and so they will cider, rotten apples, the Park horse show though angeles. etc. But bees show their good sense by ignoring grape-sugar whenever they can get good wholesome sweets. 2. It is probably true that bees do merely transfer the glucose to the cells merely transfer the glucose to the cells unchanged, but unless Prof. Wiley has made careful analyses, he does not know it. 3. "This gluttony, however, rapidly undermines the apiarian constitution, and the bee seldom lives to enjoy the fruits of its apparent good fortune." There is a grain of truth in this are during long severe winters. this, as during long severe winters, when bees are confined for weeks at a time, this kind of food induces dysentery and death. The same is true of the poorer grades of our common cane sugars, so the wise apiarist never feeds

hand and filled artificially, is indeed a crusher. This never has been done. crusher. This never has been done, cannot be done, and indeed, I think I hazard little when I say it never can be done. True, a coarse foundation is made which the bees are able to is made which the bees are able to draw out and utilize, either as brood comb or store comb. But that man can fabricate this delicate structure, with its cells only 1-140th of an inch thick, is claiming what is not only untrue, but impossible. Men can, and do adulterate liquid or extracted honey with glucose, and make a beautiful syrum, so far as mere annearmores. tiful syrup, so far as mere appearances go; but nature, and we may well thank her, has set at naught every effort to counterfeit comb honey. That, so far as the honey is concerned, is pure, clean and wholesome. Let no one, be he Professor or layman, ever dare to

#### More About Fertile Workers.

E. A. THOMAS.

In the BEE JOURNAL for Aug. 31, 1

In the BEE JOURNAL for Aug. 31, 1 noticed a friendly criticism on my article published in the BEE JOURNAL Aug. 10, by Mr. W. H. Andrews.

As Mr. Andrews has failed to comprehend my meaning, a few words of explanation may not be out of place, and may serve to make the matter more clear.

more clear.
I am more than ever convinced that I am more than ever convinced that there is a difference in colonies having fertile workers, as I have just treated a case where the bees refused to rear a queen from brood given them. Such cases may be very rare, and, judging from Mr. Andrews' remarks upon this point, I think he never had such a case.

I remarked in myarticle, that I had never had a full colony with a fertile worker, and Mr. A. makes the following comment upon it:

"This implies at least one, and may be two or three things: I. That Mr. Thomas never had a full colony. 2. That full colonies never lose their first queens. 3. That when they do lose their lirst queens, they are never without the means of supplying their loses."

without the means of supplying their

loss."
That Mr. A. should doubt my ever That Mr. A. should doubt my ever having had a full colony, is the height of absurdity. A man who has been engaged exclusively in bee culture for years, as I have been, could hardly make the business profitable without a "full colony." After having shipped over 50 colonies during the last spring, I now have more than I know what to do with

do with.

Mr. A. will please remember that I Mr. A. will please remember that I was speaking of my bees in my article, and when he says, "3rd, that when they do lose their first queens, they are never without the means of supplying their loss," he hits the nail square on the head. My full colonies are never without the means of rearing a queen, as I always insert frames of comb containing eggs into colonies. of comb containing eggs into colonies having young queens, every two days, so that, should the queen be lost, the bees have the means of supplying her loss, and, so long as they have the means to rear another queen, there is no danger of their having a

there is no oanger of their naving a fertile worker.

If Mr. A. and all other apiarists will take this pains with colonies having young queens, they will never be troubled with fertile workers. Having a large number of nuclei to care for 1

a queen. I must conclude that he never saw one of those rare cases which I mentioned, and to which my remarks had reference.

### Report of Honey Crop for 1881.

CHAS. DADANT & SON.

We give the following detailed account of our five apiaries, to show how much the crop can vary in apiaries not Champean apiary is situated about 4 miles from here, yet the quantity of honey is very different:

No. of colonies last fall, about .425 Lost about 53 Sold about 100

We had, therefore, about 272 colonies, or a few more, to begin with.

#### REPORT OF THE CROP.

	nies.	now.	Crop in July.	Sept.
<b>Y</b> piary	Baxter 70	85	1,800	-1.300
	Champeau.50	65	2,200	-1.250
k +	at Home80	80	2,000	180
k %	Villemain .40	60	1,500	380
	Jack 32	40	800	2,000
			-	-

272 330 8,300 5,110

These 13,400 lbs. are all extracted, except about 500 lbs. of comb honey. Although we designate the 5,110 lbs. as fall honey, it is mainly spring honey.

as fall honey, it is mainly spring honey, having been gathered mostly on white clover in July and first of August.

Our crop, especially at home and in the Villemain apiary, was shortened on account of the dry weather. We have had no rain of any account for more than two months, and very warm weather all the time. The Jack apiary is near the Mississippi bottoms, which were covered with polygonaceae as soon as the water receded. Our business of foundation making having increased, we were unable, for lack of ereased, we were unable, for lack of time, to make as many swarms as we had anticipated. Hamilton, Ill.

### Palestine or Holy Land Bees.

WM. J. WHITFIELD.

We were fortunate in having 2 of the Palestine queens come through the past winter in good condition, to start with in the spring, but as I had Italians that seemed to be in quite as good condition, I thought very little of them at first.

About June 1, I noticed they had more than double the bees on the wing than any other colony, and I took a glance at the inside, which showed 12 frames of brood in one, and showed 12 traines of of coor in our, and 9 in the other, frames 1 foot square. I how began to watch them with interest. They gave just double the increase, and each colony gave 13 more honey than the best Italians, so 1 thancht 1 would fry and rear a few thought I would try and rear a few queens, re-queen all hybrids and those having old Italian queens. I reared the queens, but had no time to remove the queens, but had no time to remove the old queens to make room for the young, till Saturday, Sept. 17. In some of the hybrid Italians, I found a few cells of brood just ready to hatch, but not an egg or cell with unscaled larvæ in any of them. The Palestine queens I found laying without exception, and all crowded with bees and honey. I went to Mr. Jones on Sept. 20, and procured one of his Island-mated queens to start another year with. I saw about 150 of his hives opened; his 3 men were employed in fixing them up for winter. There were Italians, Cyprians and Palestines, about in equal numbers, but only the Palestines were still laying. This decided me to take 2, ina large number of nuclei to care for. I have not thought that it paid to insert brood, so that, should the first queen be lost, there will be no brood of any kind in the live, and a nucleus in this condition soon becomes desperate. I raise my queen cells in full colonies, and insert in, nuclei when ready to hatch, so that they will have no brood until the first queen begins to start another year with. I saw about 150 of his hives opened; his 3 men were employed in fixing them up for winter. There were Italians, Cyprians and Palestines, about in equal numbers, no brood until the first queen begins to start another year with. I favore the first queen begins in this condition soon becomes desperate. I raise my queen cells in full colonies, and insert in, nuclei when ready to hatch, so that they will have no brood until the first queen begins in the condition of the Italian bee. The practical, not theoretical, is what the year with. I saw about 150 of his his opened; his 3 men were employed in fixing them up for winter. There were Italians, Cyprians and Palestines, about in equal numbers, willing to shed their shoes when they approach this field, if the paths over time the condition of the Italian bee. The practical, not theoretical, is what the year with. I saw about 150 of his his opened; his 3 men were employed in fixing them up for winter. There were Italians of dollars damages to the beer keepers of North America, since the was especially good for breeding. The price of honey, however, will be ands of dollars damages to the beer. I saw about 150 of his his dollars damages to the beer and so dollars damages to the beer and so dollars damages to the beer was proved to be were selected. The price of honey, however, will be was especially good for breeding.

The price of love. The high, as butter is scaree and high in year with the season and so dollars damages to the beer lateral to the proved the proved the proved that the proved the proved the proved the pr

arrived from Mr. Frank Benton, all in fine condition, having 2 combs Sinches square and about a quart of bees with each. I would have obtained one of them, but, as Mr. Jones was not there, the men in charge would not part with one, not having orders to do so, although I offered three times the amount I would have given for one at this time of the season, for I desired to see what they would do.

Many mothers would not handle

Many mothers would not handle babies with as much care as these queens had.
Dundas, Ont., Sept. 22, 1881.

For the American Bee Journal. The First Movable-Frame Hive.

### C. J. ROBINSON.

I have written to Chas. H. Lake, of I have written to Chas. II. Lake, of Baltimore, requesting him to take to the National Convention at Lexington, the first movable-comb frame hive seen in America. The hive with a colony of bees in it, was presented by King Otto, of Greece, to the lamented Richard Colvin, late of Baltimore.

The Grecian hive is four stories, that is four tiers of frames one above the other. The frames are about 8 inches deep and 13 inches in length. One side wall of the hive swings open like a door and the comb-frames slide

like a door and the comb-frames slide in suspended on pendants and rabbets like the Langstroth frame. The hive proper is of double-walls—a hive within a hive with a vacant or deadair space between the inner walls and outside walls. There are 4 iron staples or rings for suspending the hive between trees.

outside walls. There are 1 from staples or rings for suspending the hive between trees.

It was from an inspection of this hive that Rev. Mr. Langstroth got the idea of his movable-frame hive; at least I so understood it at that time, and Mr. Colvin so reported it. Mr. L. contrived a shallower hive than the Grecian model, using only 2 tiers of frames of greater depth and length, and opening from the top, allowing the frames to be lifted instead of being slid in from one side. I still use a hive having the features of the Grecian model except my hives open from the top. The dead-air feature of said hive brings in and utilizes a principle that is or might be the salvation of out-door wintering. The old hive from Greece is far superior to any chaff hive. Mr. Lake has a hive that he styles "Old Reliable," which is the result of years of remodling of that he styles "Old Rehable," which is the result of years of remodling of the Grecian hive, and the best hive for both summer and winter in use.

The old hive is a curiosity of great interest, and I hope it will be on exhibition by Mr. Lake.

Richford, N. Y.

For the American Bee Journal.

### The Purity of Drones.

W. H. ANDREWS.

In the Manual of the Apiary, page 89, Prof. Cook says:

"The fact that parthenogenesis prevails in the production of drones, has led to the theory that from a pure queen, however mated, must ever come a pure drone.

Doctors widely differ as to the fact that led to this theory, and then ad-mitting the fact, some of them dis-pute the theory—"the deduction." If this deduction cannot be sustained in practice, then it is true that too much theory has wrought hundreds of thousands of dollars damages to the bee-

of feeding glucose for this and other brood. Mr. Andrews says he never reasons, is unwise and impolitic. 4. saw the bees treat a fertile worker specting a number of fine queens just among the learned, but what is that to the statement that comb is made by with the respect and consideration due arrived from Mr. Frank Benton, all in the practical bee-keeper? We know that an unmated queen can lay eggs that will hatch out drones, and drones that will hatch out drones, and drones only, and we also know that a mated queen will not lay drone eggs into worker comb, while we as well know that an unmated queen will lay her eggs into worker comb as readily as into drone comb. Now it is quite as easy for a bee-man who cannot read Greek, to imagine that the mating of a queen of one race with a drone of a queen of one race with a drone of another race, affects the blood of her drone progeny, as it is for the sa-vants to imagine that the fact of matsants to imagine that the fact of mat-ing controls the queen in the dispo-sition of her drone eggs in the comb, and that the want of mating leaves her reckless as to the welfare of her offspring, and allows her to become the mother of an innumerable host of dwarfs. dwarfs

dwarfs.
Let the doctors tell us in plain English, that an Italian queen mated with a German drone will produce drones uniform with those produced by her sister, mated with a drone of her own nationality. Then it will not be out of order for him to inform us that a black queen mated with a yellow drone will not produce drones showing plainly that they, too, have a parentage to be proud of.

McKinney, Tex.

### Ontario Bee-Keepers' Association.

The above named body held its an-The above named body held its annual meeting on three successive evenings, during the second week of the Toronto Industrial Exhibition, Sept. 14, 15, 16. A brief summary of the proceedings, condensed from the reports given by the Toronto Globe and Mail, will show what our apicultural friends over the border have been saying and doing. ing and doing :

The second annual convention of the Ontario Bee-Keepers' Association, commenced on Tuesday evening in the executive room of the City Hall. There was a large attendance.

At 8 o'clock the President, Mr. D. Jones of Beston took the shirt

At 8 o'clock the President, Mr. D.
A. Jones, of Beeton, took the chair,
and in a few brief remarks stated the
object for which the meeting was
held, after which the Secretary, Mr.
R. McKnight, of Owen Sound, read
the minutes of the first annual Convention, which was held in Toronto
during the Exhibition last year. The
minutes were adouted

minutes were adopted.

The Secretary called the roll, after which Messrs. Dougall and Sandford were appointed a committee to audit

the books and accounts.

The following gentlemen were appointed a committee to select subjects for discussion at the meeting this evening: Messrs. Hall, Wells, Clarke, Phillips, Woodward, Drs. Duncan and Nugart Nugent.

The President in his address referred to long speeches, either written or extemporaneous, as an objectionable feature of conventions, and suggested that the speeches should be short and pithy. Never was there such a severe winter in the experience of bee-keep-ers as last winter, in fact, many who were considered the most seientific bee-raisers in the country had lost all they mosessed in consequence of the hee-raisers in the country had lost all they possessed in consequence of the severe weather. The yield of honey last season was small, but the season was especially good for breeding. The price of honey, however, will be high, as butter is scarce and high in price. He advised all who had honey to sell, to hold back for a time, and a remunerative price would be insured. One gentleman had told him the previous day, that honey he would gladly have accepted 10 cts. per 1b. for a few ting of bees in the fall was much more important than the wintering of them. "There never has been," continued the President, "such a fine apiary exhibit in the world as the present one at the exhibition grounds, and it reflected great credit on the association." (Cheers). In speaking of the various species of bees, he said he had been held to entertain a very high pain. been led to entertain a very high opinion of the Apis dorsata species, accounts of which had been very flattering. He had been doing his best to ing. He had been doing his best to obtain a hive of them, but his efforts had been unsuccessful so far. He trusted to secure them shortly. There was another species of bee, said to be even better than this, which a European friend of his had wri ten to him pean friend of his had wri ten to him about, and he hoped to be able to say more about it shortly. Canada, he said, was the finest country in the world for raising bees, and he was confident that 20 per cent, or more could easily be made by entering into the business with a will. Judging from the comparative success with which his bees were wintered this year, in view of its being such a severe one. in view of its being such a severeone, it was fair to infer that any sort of it was fair to infer that any sort of bees could be successfully raised in Canada. After paying a high com-pliment to the Secretary, to whom he stated the success of the Association was largely due, the President re sumed his seat amid much applause. The Rev. W. F. Churke on being re-

The Rev. W. F. Clarke, on being requested, addressed the meeting. The fact, he said, that the membership was increasing so rapidly, was a good evidence of the success of the Association. The great hindrence to the suction. The great hindrence to the successful raising of bees was the fact the majority of people imagine that all they have to do is to set the hive on a they have to do is to set the hive on a stand and leave the rest to the bees. This is a mistake. Bees, like every other animal which is kept for the benefit of man, must be provided and cared for, or they will never prove successful. People should inform themselves on the subject before they go into the lusiness and then theave. go into the business, and then theory go into the business, and then theory must be conjoined with practice, for the subject requires a great deal of thought and vigilance. People grumbled about bees being more bother than they were worth, but he would venture the assertion that there was not a pure if the property man not a pursuit which, if properly managed, would prove more remunerative than that of bee raising. The intro-duction of Italian bees to Canada had greatly benefitted the old stock. After dwelling on the qualities of the President, Mr. Jones, as a practical apiculturist, and on the great benefit that had accrued to the Association in correspondence of his compaction with it. consequence of his connection with it. Mr. Clarke concluded by stating that the Government should be asked to aid in the advancement of the industry, from which he said every town-ship in the country might derive a revenue of \$10,000 annually if the industry were properly managed.

### SECOND EVENING.

Mr. D. A. Jones, President, in the chair, and a large number of members were present. The Chairman stated that two cakes, one a ginger and the other a sponge, both sweetened with honey, had been sent to the Convention by Mrs. J. G. Wallace, of Brigh-

The cakes, being cut up, were passed to the members present, who discussed the merits, which, it might be said, were uncommonly good. be said, were uncommonly good. It was stated that a cake sweetened with boney was better to keep than one sweetened with sugar, as the honey would keep it moist. The Chairman would keep it moist. The Chairman stated that if ladies would use honey in making cakes, they might do their baking in the winter time when it was cool, and have fresh cakes all through

the summer.
On motion of Mr. Beech, seconded

such provision as would insure the safe-keeping of the bees. He himself value, as a sweetening in the processes had a number of fine hives spoiled of cookery is one of the most imfor want of this. The proper regulating of bees in the fall was much more adulteration practiced upon almost portant, especially in view of the adulteration practiced upon almost all grades of sugar, and this meeting takes the opportunity afforded by the presentation of Mrs. Wallace's excelient cakes, to call the attention of the public to the great superiority of honey to sugar in all cases in which an absolutely pure sweet is desired." Carried.

#### QUESTIONS FOR DISCUSSION.

The Committee appointed to decide upon the subjects for discussion, reported the following: I. Wintering. 2. Spring dwindling. 3. Deep rs. shallow for the company of comb. form. 2. Spring dwinding, 5, Deep cs. snar-low frames. 4. Uses of comb foun-dation, 5. What is the cause of a colony fighting and killing others? 6. Final preparation of the live for winding of the cause of a tering, disposition of combs, etc. 7. Best mode of obtaining the largest yield of comb honey in sections. 8. Is pollen injurious to wintering? 9. Foul brood, its prevention and treatment. 10. The best way to winter

ment. 10. The best way to winter bees in Muskoka. The Secretary, who had also acted as Treasurer, read his report. He stated that a few weeks ago he had sent to the members a form of entry for the exhibition, together with a for the exhibition, together with a printed circular for the purpose of ascertaining what progress had been made in bee culture by the members. Twenty-seven members out of 68 had reported, and from them he had gathered the following: Last fall they put into winter quarters 1,534 colo-nies, or an average of 56 colonies each. Of these there were 1.254 taken out alive in the spring; 216 were lost by spring dwindling, leaving an aggregate working force of 905 colonies, or an average of 37 per member. At the time of reporting these, 906 were increased to 1,993, or an average of 74 colonies per member, as against 37 in the spring. This showed that not-withstanding the unusual mortality withstanding the unusual mortality among bees last winter, there are now in the hands of these 27 members, 20 per cent, more bees than at the corresponding time last fall. The honey taken by the members who reported, amounted on an aggregate to 73,790 pounds, or an average of SP<sub>2</sub> pounds for each colony held at the opening of the lower senson. Over 3, of the the honey season. Over  $\frac{3}{4}$  of the amount was taken by the extractor.

The report being found satisfactory, a vote of thanks was tendered to the Secretary for the satisfactory manner in which he had transacted the business of the Association during the year.

The meeting then went into discuss ion on the first subject, which was

### WINTERING.

Several of the members related their Several of the members related their experience in wintering bees. Mr. Hall, of Woodstock, stated that he commenced preparing on the 15th of September, and wintered until 15th of April. There was a cellar under the bee-house, which was built with walls 16 inches thick, packed with sawdust. When he put them out he had no dwindling; last year he had lost 2 out of 137 colonies.

President Jones stated that there

President Jones stated that there was no surer way of killing bees than by disturbing them late in the fall. He had lost \$1,000 worth of queens received from his Cyprus apiary late in December, to accommodate which he had been obliged to break up and di-vide a number of colonies. He always tried to get as many young bees late in the fall as possible, and when once the winter cluster was formed, he pre-ferred not to disturb it.

In reply to a question, Mr. Jones stated that when bee-keepers were troubled with mice, they should use arsenic, granulated white sugar and flour in equal parts, as a poison.

Mr. Wallace, of Brighton, who had put in 32 last fall, had taken them all out. He had lost pure by robbing

had given their experiences. He had commenced with I colony, and now he had 40. The President had said that had 40. The President had said that if he disturbed bees in the fall it was not good for them. He, Mr. Beech, had disturbed his in December, and some which he had out of doors were in better condition in the spring than those he had placed in the cellar. There were dead bees found in the hives left in the cellar, and he did not pay much attention to the hives there. The cellar was well vanished. The cellar was well ventilated, for his family used it for ordinary purposes. They kept potatoes beside the hives, and the bees kept beside the potatoes, and kept well. and kept well.

While the discussion of wintering

was in progress, His Worship, the Mayor, entered, and was given a seat beside the President.

It was moved by Dr. Nugent, Strathroy, and seconded by Mr. Wal-lace, "That the Bee-Keepers' Asso-ciation, in Convention assembled, desire to express their appreciation of the efforts of the Industrial Exhibi-tion Association, of Toronto, to provide suitable accommodation for proper display of the products with which they are most closely identified, but also of all classes of agricultural and manufacturing products, and to further express their opinion, that if a Dominion Exhibition is held in the year 1882, it should be held in the city of Toronto, and that aid should be granted thereto by the Dominion and Ontario Governments." Carried.

After a limited discussion of several of the other subjects, the meeting adiourned.

A very interesting open air meeting of bee-keepers, was held in the morning in the tent adjoining the building devoted to the apiarian display on the exhibition grounds. Among the subjects discussed, was the difficulty in feeding up queens so as to get them to breed again, after they have ceased breeding in the fall; the proper dis-tance between combs for wintering; keeping out moisture and mice; treat-ment for foul brood; queens laying drone eggs in worker cells; feeding bees; the existence of "honey dew," and how it is formed, and many other

interesting topics.

Mr. Jones exhibited a number of frames containing queen cells in dif-ferent stages of development. The discussions were also listened to by a goodly number of persons who are de sirous of learning something about bee culture, and the keenest interest was manifested by all.

### THIRD EVENING.

After discussing the various questions which were placed before the meeting, Mr. McKnight suggested the necessity of taking steps to secure an Act of Incorporation.

Mr. S. Webster then moved, sec-

Mr. S. Webster then moved, seconded by Dr. Nugent, that the President and Secretary of this Association, be instructed to take the necessary steps to secure an Act of Incomparation from the Outario Legisland. poration from the Ontario Legislature, in the names of the officers of the association for the coming year; also to use their endeavors to obtain a grant in aid of this organization, and to put it on the same footing as the Dairymen's Association, Fruit Grow-ers' and Poultry Associations of the Province of Ontario. Carried unani-

mously.
The following gentlemen were ap-The following gentlemen were appointed honorary members of this association: The Mayor of Toronto, the President of the Toronto Exhibition Association, Mr. Withroy, Mr. Jas. Mills, Principal of the Guelph Agricultural College, Prof. Brown, Guelph, and whatever other gentlemen the Executive Committee deem advisebble. advisable

The following resolution was carried: Resolved, "That the encouragement to the bee-keeping interest of the country by the Toronto Indus-On motion of Mr. Beech, seconded by Mr. S. Webster, a vote of thanks to Mrs. Wallace, who had kindly sent the cakes, was passed.

It was moved by W. F. Clarke, and seconded by N. B. Colcock, "That of the cake, who had kindly sent the cakes, was passed.

Mr. J. T. Beech, of Burnt River P. to secure which desirable result this seconded by N. B. Colcock, "That of the country by the Toronto Industrial Association, is an example that the province of Ontario and the Dominion of Canada, Mr. J. T. Beech, of Burnt River P. to secure which desirable result this meeting urges upon the bee-keepers

of wintering differed from those who the importance of pressing the matter upon the attention of the directors of exhibitions in all parts of the country. In moving the above resolution, Nugent took occasion to remark upon Augent took occasion to remark upon the little interest taken in bee-keep-ing by the Provincial Exhibition, which was shortly to be opened at London. The prizes offered did not amount to much more than \$15.

ELECTION OF OFFICERS.

The President begged to remind the members that he was not a candidate for re-election; indeed, he would re-gard it as a great favor to be allowed to retire, on account of the large amount of private business which he

had to attend to.

The election of officers for the en-The election of officers for the ensuing year, resulted as follows; Hon. Lewis Walbridge, Belleville, President; Mr. J. B. Hall, Woodstock, first Vice-President; Rev. W. F. Clarke, Listowel, second Vice-President; Mr. R. M. McKnight, Owen Sound, Secretary and Treasurer; and Messus. D. A. Jones, Beeton, Dr. Nugent, Strathroy, W. C. Wells, Phillipstown, Dr. Shaver, Stratford, and S. Cornell, Lindsay, Committee, Mr. D. A. Jones, and Rev. Mr. Clarke were appointed a delegation to the North American Bee-Keepers' Association, to be held at Lexington, Ky., Oct. 5-7, 1881.

Ky., Oct. 5-7, 1881. Mr. Jones vacated the chair, and Mr. Hall, first vice-president, took the same.

A unanimous vote of thanks was passed to the retiring President, Jones, for the able way in which he had discharged his duties during the past year.

Mr. Jones thanked his friends, and

promised to do all in his power for the association in the future, as he had

A vote of thanks was also passed to
the Secretary and Treasurer, for his
valuable services during the year.

Mr. Jones then moved that the hearty thanks of the association be passed to *The Mail* and *The Globe* for the excellent reports which had been given of the matter. given of the meetings of the convention, both at the City Hall, and on the grounds during the exhibition. motion was carried unanimously.

A vote of thanks was passed to the Mayor and Corporation, for the use of the room in which the meetings had

On motion of Mr. Jones, it was resolved to hold the next meeting of the association in Toronto, during the exhibition of next year. The meeting then adjourned.

Kentucky Bee-Keepers' Association. The second annual convention of the Kentucky State Bee-Keepers' As-sociation, will be held in the Exposi-tion Building, in Louisville, Ky., on Wedbesday and Thursday, Oct. 12 and 13, 1881.

A fine display of bee-keepers' supplies, honey, etc., is expected, and some of the most prominent bee-keepers in America, who will be in attendance at the National Bee-Keepers' Convention, at Lexington, Oct. 5, 6, and 7, are expected to attend. All are invited. X. P. ALLEN, Pres.

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Nov. 20, 1881

N. E. FRANCE, Sec., Platteville, Wis.

The Michigan State Bee-Keep-rs' Association, will convene at Battle Creek, on Thursday, Dec. 8, 1881. We have reason to expect one of the we have reason to expect one of the largest and most interesting meetings we have ever 'held. Let all arrange to be present. All District Associations should send delegates. Each person should come with their best experience in their hands, ready to hand it own to the others of the fertomity. it over to the others of the fraternity. It is hoped that all will bring the fullest report possible from their region.
Commutation rates are expected on railroads.
A. J. Cook. Pres.
T. F. BINGHAM, Sec.

More Honey than Ever.—I should indeed feel lost without the weekly visits of the Bee Journal. I suffered severely last spring, with the majority of bee-keepers, but have done well this year, therefore produced more honey per hive than during any one year since I began the business. The dry weather has shortened the product te some extent here, but nothing dry weather has shortened the product te some extent here, but nothing compared to many other places in our state. The local demand for honey is all that I could ask for. Success to the BEE JOURNAL.
SAMUEL STEVENSON, M. D.

Morenci, Mich., Sept. 24, 1881.

No Surplus.—My bees are not doing well this season; no increase and no surplus honey. I have been feeding surplus honey. I have been feeding some time. Bees on the bottom lands are doing well. I lost all the bees I had in chaff hives, last winter. I shall not try them again very soon. I prefer a nail-keg for wintering purposes to a chaff hive. H. W. Hirr. Merritt, Ill., Sept. 26, 1881.

Sample Copy for Next Year.—I was very much pleased to note the change in size and general appearance of our BEE JOURNAL. I did not like the Weekly BEE JOURNAL in its original form, but I belong to those who are trivialities to the second of not willing to complain, unless it should be a very essential error. Some single articles which have recently appeared in the BEE JOURNAL, are worth JOURNAL for the whole year.

WM. S. BARCLAY.

Beaver, Penn., Sept. 23, 1881.

California Honey Crop.—Permit me to correct an extract that you copied from the San Francisco Examiner, in regard to the honey crop of Southern California. While we are always ready and willing to present our productions to the consideration of the ready and willing to present our productions to the consideration of the public, we are unwilling to be misrepresented. He says "Last year the honey crop of San Diego county amounted to 1,291,800 lbs., and this year it will be larger." It is now a well established fact that we will not produce \(^1\_4\) of a crop. I cannot say how much the other counties referred to will make, but 1 do know that a great many apiarists will not ship a pound this season. In a few favored localities as much as \(^1\_2\) of a crop will be made. A great many others, none. The spring was too cold. Our bees are in good condition and with a fair seain good condition and with a fair season we can produce more honey and a better article, than any other county in Uncle Sam's domain. I think I have found a new bee food, especially for this section, it is the black-eyed pea, called by western people black-eyed bean. It is the old fashioned eyed bean. It is the old fashioned Southern black-eyed pea, most excellent for man and beast, and has proved a splendid bee forage with me; the bees are on it early and late. Here the vines produce two crops, so that it gives early and late feed for bees. There is no better bean or pea grown for the table than this, either green or dried. At this time the vines or in full bloom, second crop.

M. C. ALVORDSON.
Santa Maria, Cal., Sept. 18, 1881.

About 330 lbs. of Honey from one Colony.—I wish to show what I have done alone with 10s colonies in spring. I now have 20s colonies, and 15,100 lbs. of extracted and 4,500 lbs. of comb honey. My best yield from one colony is continued. honey. A is 330 lbs. is 330 lbs. of comb honey and its in-crease, which was 1 artificial swarms, erease, which was 4 artherm swarms, with plenty of honey. I have kept bees 16 years, I think I know how to get honey, if I cannot winter so well as some. My comb honey is all sold at 16c, for white and 12c, for dark.

W. L. COGGSHALL.
West Groton, N. Y., Sept. 19, 1881.

Bingham's Bee Report.—I had in the spring 55 colonies, have now 119; extracted, light, 3,000 lbs; bees in fine condition for winter. The scarcity of fruit has made a prompt demand and all our honey is sold but 800 lbs. Sold at 10c. in 30 lb, tin cans, and all returned or paid for by the purchaser.

T. F. BINGHAM.

Abronia, Mich., Sept. 22, 1881.

My Honey Yield.—I wintered with a loss of only 10 per cent. I started with 70 colonies in March. Many of the queens were inefficient and not the queens were mannered and not having time to replace them (except four or five) the whole surplus was taken from 50 colonies. My total product is 3,500 lbs; of which 2,800 was comb honey. Too much cannot be said in favor of comb foundation. Its new ways the key to whetever success I use was the key to whatever success I have had. Had I used full sized starters for the sections I am sure I would have saved many times the cost. Very little, if any, surplus has been made by bees managed under the old system. — Д. W. Роктък. Charlottesville, Va., Sept. 27, 1881.

Nearly 140 lbs. to the Colony in Spring.—1 had 108 colonies in the spring, have now 131 colonies. Have extracted 9,000 lbs. of light honey and extracted 9,000 lbs. of light honey and 5,100 lbs. of dark honey; comb honey 325 lbs.; total, 14,725 lbs. Bees are now in good condition. I have not got quite through extracting yet, so have had to estimate a little, but it is very close to what I will actually have.

O. O. POPPLETON.

Williamstown, lowa, Sept. 26, 1881.

Chall Hives.—I had 8 good colonies in spring and 2 queenless.—I have extracted no honey, but 1 have taken 700 lbs. comb honey, mostly in one pound sections. Bees are now in good condition. My bees wintered good condition. My bees wintered without loss in double-walled chaff hives out of doors. I had plenty of loose chaff on top of frames as an absorbent. Most of the bees around me hind.

Smyrna, N. Y., Sept. 19, 1881.

The Fall Honey Crop .-The Fail Honey Crop.—The honey crop here has been a failure, on account of the drouth. I have had the blues for some time, thinking I would have to feed again this fall, but we had a good rain 2 weeks ago, and the golden rod has been giving us plenty of honey and I think they will have golden rod has been giving us plenty of honey, and I think they will have plenty for winter. Let me urge all bee-keepers to see that their bees have plenty of honey, and pack them in chaff before the weather gets too cold. Success to the BEE JOURNAL. I know I have made many times its cost by taking the advice of experienced beekeepers.

B. M. LINGLE.
Paoli, Ind., Sept. 26, 1881. keepers. B. M. 1 Paoli, Ind., Sept. 26, 1881.

Drones from an Unfertile Oneen. - In Dr. Tinker's article on "Reproduc-tion in the Honey Bee," on page 299, vol. 17, of the BEE JOURNAL, he says: vol. 11, of the DEE HOURNAL, he says.

It has not yet been shown that the drone of virgin queens possess full virile powers. Manyhave endeavored to get queens fertilized early in the spring by such drones, but have failed." I have had but little experience of this kind, and have given it very little thought. I have always believed that drones from a virgin queen did have full virile powers, and will give a case of my own that confirms me in that belief: In the winter of 1878-9, I had belief: In the winter of 1878-9, I had a strong colony of bees that lost its queen during the winter, and reared another from the eggs left when the old queen was lost. When I examined, in March, I found 3 combs partly filled with drones. On the 12th, I removed the queen and gave them a frame from another hive with eggs and young brood. On the 20th, I noticed drones flying, and on the 28th, I found my young queen hatched, on

Bingham's Bee Report.-1 had in mistaken about my queen mating mistaken about my queen mating with one of the drones from the virgin queen, but think it hardly probable that any others were dying that early, as it was a very wet and backward spring.

L. R. JACKSON,
Fairland, Ind., Sept. 23, 1881.

Hardly an Indorsement.—On page 302 of the BEE JOURNAL, you say your correspondent, Jas. E. Cady, "does serious injustice to Mr. Heddon." If rious injustice to Mr. Heddon." If you will examine page 15 of Mr. Heddon's circular and price-list, and see what he says under the head of " Dollar Queens," you will see that your correspondent does Mr. Heddon no injustice. If this is not a voluntary puff for H. A. Burch & Co., please tell us through the BEE JOUNNAL what it does mean, for 1 confess I cannot understand it otherwise.

L. K. DICKEY. High Point, Ga., Sept. 24, 1881.

[The following, which had escaped our notice, is the passage above referred to:

"I am not prepared to furnish my customers with dollar or warranted queens during 1881, but will say that having visited the apiary of H. A. Burch & Co., of South Haven, Mich., and closely inspected their bees, have found them more uniformly pure than any I have seen; hence, purchases of dollar and warranted queens from their stock will likely prové satisfactory.

True, it does look like a voluntary "putf" for Mr. Burch's bees; and almost any of us might have said perhaps nearly the same of anybody whose specialty we considered really superior, and we do not think Mr. Heddon anticipated any other construction would be placed upon it.

We have received many complaints against Mr. H. A. Burch, in fact, quite enough to fill an issue of our paper, but as we have published enough to satisfy our readers we had good reasons for discontinuing his advertisement, we shall print no more of them.—ED.1

A Lady's Experience.—I had 37 colonies in the spring—have now 54. I have extracted 10 lbs. of light honey have extracted 10 lbs. of light honey and 50 lbs. of dark; comb honey 3,700 lbs. Bees are now in good condition.

HATTLE A. HEATON.

Charlton, N. Y., Sept. 26, 1881.

The Weekly One Good Meal.-I like the BEE JOURNAL very much, as a weekly. It does not contain so much but it can be read at a single sitting. ees have been nearly a failure with e this year. M. C. STEVENS. La Fayette, Ind., Sept. 28, 1881. me this year.

No Exhibits at Toledo, O., Fair.— Since all items of information on the Since all tents of mormation on the honey question may be of use to some, I will say that I attended the "State Fair" at Toledo, O., and exhibited a case of honey. There was no other exhibit of any thing in the apiarian line from the States of Indiana, Ohio and Michigan. This shows how many and Michigan. This shows how many bees were destroyed last winter in this part of the country. L. Eastwood. Waterville, O., Sept. 26, 1881.

[Does it not rather show a lack of interest and enterprise in the beekeepers of that section of the country? Until lately, apathy has been the rule; now an interest is being awakened, that will, we hope, be lasting.—Ep.]

Remedy for Ants in the Apiary, Etc. and young brood. On the 20th, I noticed drones flying, and on the 28th, I found my young queen hatched, on the 1fth of April she commenced to lay worker eggs, and proved to be a good queen, and was purely mated. I know of no other Italian bees within 4 miles, and did not have any other drones flying until May. I may be lost, on an average, 11 pounds since the ally invited.

Remedy for Ants in the Apiary, Etc. ally invited.

WM. M. S. Dodge, Sec. Coopersville, Mich., Aug. 29, 1881.

Coopersville, Mich., Aug. 29, 1881.

Italians, in good condition, but some require feeding, as they have drones flying until May. I may be lost, on an average, 11 pounds since the

honey season closed. I have extracted 771 lbs. of honey, and have 29 lbs. of comb honey. As a remedy for ants, I have used fine salt for 20 years, and seldom have to make the second application. What a weekly intellectual feast is to a monthly surfeit, such is the Weekly to a monthly journal. Long may the welcome Weekly Bee Journal prosper. J. L. Wolcott. Bloomington, Ill., Sept 26, 1881. Bloomington, Ill., Sept 26, 1881.

Honey Season in Massachusetts. The honey season here has been one of the poorest I have known for years. Raspberries and white clover proved a failure, on account of bad weather, and basswood did but little better. It has been a good season for increase, there being just honey enough to keep there being just honey enough to keep the bees breeding rapidly. I am more than pleased with the form in which the Bee Journal is to be published for 1882—so convenient for binding. I cannot well see how any one (even if they have only I colony of bees), can do without it. E. A. Thomas. Coleraine, Mass., Sept. 8, 1881.

But Little Surplus Honey.—I have 3 small apiaries. No. 1 had 3 colonies last spring; 8 now; 6 of them making surplus; all strong; are doing well; Italians; Langstroth hives. No. 2 had 10 colonies last spring; 26 now; all strong; are doing well; hybrids; Langstroth hives. No. 3 had 16 colonies last spring; 28 now; all strong; are mostly blacks; Langstroth hives. I have received but little surplus honey, but all three apiaries are now doing well on smartweed.

S. GOODRICH. Urbana, Ill., Sept. 26, 1881.

Urbana, Ill., Sept. 26, 1881.

A Correction.—In No. 37, page 292, "Ants in the Apiary," 3rd line from bottom, read I ownee, instead of 10.

A. B. McLAVY.

Bastrop, Tex., Sept. 20, 1881.

Two Owing to the fact that the time of the regular meeting of the Union Bee Association. at Shelbyville, Ky., conflicts with the time fixed by the exconflicts with the time fixed by the ex-ecutive committee, to hold the Na-tional at Lexington, the meeting of the Union, at Shelbyville, has been postponed till the 20th of October. G. W. DEMAREE, Sec. Christiansburg, Ky., Sept. 3, 1881.

The Rock River Valley Bee-Keepers' Convention, will be held at Monroe Center, on the third Tnesday in October. We hope a good atten-dance will be the outcome, and the bee interest revived.

D. A. CIPPERLY, Sec.

The North Eastern Wis. Bee-Keepers' Association, will hold its fall meeting at Peewaukee, Wis., on Thesday and Wednesday, Oct. 11 and 12. A full attendance is cordially requested. Notice of the plance of meeting will be found at the local Part Office.

Post Office.
Geo. Church, *Pres.*, Neenah, Wis. Frances Dunham, *Scc.*, Depere, Wis.

The Northwestern Bee-Keepers' The Northwestern Bee-Keepers' association will meet in Chicago, on Thesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. MILLER, M. D., Pres. C. C. COFFINBERRY, Sec.

The Western Michigan Keepers' Association will meet in Berlin, Ottawa, Co., Mich., Thursday, Oct. 27, 1881, in Huntley's Hall, at 10:30 a. m. All interested, are cordially invited.

WM. M. S. Dodge, Sec.
Coopersville, Mich., Aug. 29, 1881.

### Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the *old* as well as the new address.

© Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Deserving Articles are Always Appreciated.—The exceptional cleanliness of Parker's Hair Balsam makes it popular. Gray hairs are impossible with its occasional use. 40w4t

A Sample t'opy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth: for a club of 6, we give a copy of the Journal for a year free. It will pay to devote a few hours to the BEE JOURNAL.

It is the Height of Folly to wait until you are in bed with disease you may not get over for months, when you can be cured during the early symptoms by Parker's Ginger Tonic. We have known the sickest families made the healthiest by a timely use of this pure medicine.—Observer. 40w4t

It would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—Also, if you live near one post-office and we there have the country pair, at mother he sure to get your main at another, be sure to give the address we have on our list.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums:

For a Club of 2,—a copy of "Bees and Honey,"
" 3,—an Emerson Binder for 1882.
" 4,—Cook's (Bee) Manual, paper.
cloth.
" 6,—Weekly Bee Journal for 1 year.

₩ We have a SPECIAL EDITION of the Weekly Bee Journal, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

### Honey and Beeswax Market.

HUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, Saturday, 10 a. m., Oct. 1, 1881.

The following are the latest quotations for honey and beeswax received up to this hour:

#### CHICAGO.

HONEY The market is lively and prices steady. I have just purchased a car load of extracted a current prices.

We quote light comb honey, in single comb bayes, 18-20c; in larger boxes 2c, less. Extracted

BEESWAX Prime quality, 186622c. AL. H. NEWMAN, 972 W. Madison St.

#### CLEVELAND.

HONEY-There is a slight improvement in our market for comb honey. One pound impliessed sections find ready sale at 21c, for white, and 196 20c, for 21b, sections. Extracted honey continues | 100 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120

### NEW YORK.

HONEY—The market is well supplied at present, but there is a large prospective demand.

We quote as follows: White comit, in small boxes, 18-20-e; dark, in small boxes, 15-21-c. Extracted, white, 10-12-c; dark, 76-20-c.

BEESWAX.—Prince quality, 25-24-c.

THORN & Co., 11 and 13 Devoe avenue.

#### CINCINNATI.

HONEY—Is in good demand here now. I quote: Good comb honey, in sections, is worth Hoofec, on arrival. Extracted, Tesse, on arrival. BEESWAX.—18622c., on arrival. I have paid 2.c. per lb. for choice lots. C. F. MUTH.

#### BOSTON.

HONEY.—Our honey trade has now fairly commenced, and we are selling quite freely. We find that one-pound combs are a very desirable package in our market, and a large quantity could be sold at 20622c, according to quality.

BEESWAX—Drime quantity, 25c.

CROCKER & BLAKE, 57 Chatham Street.

#### BALTIMORE.

HONEY,-But little on the market, and prices are not quoted. BEESWAX.-Southern, pure,21@23c.; Western, pure,21@ 22c.; grease wax, He.-Baltmore Market Journal.

#### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb, sections, 22@25c.— Indianapolis Stock Review.

#### SAN FRANCISCO.

SAN FRANK 65. O.

HONEY.—Sales of choice comb, to arrive, have been effected at 20c, for small lots. It is doubtfui if an order for a large lot of choice comb could be filled in this market. Choice extracted, in barrels, is quotable at 16645c We quote white comb, 166626c; dark to go. d, 10664 lot. Extracted, choice to extra white, 966 1045c; dark and candied, 8c. BERSWAX—236-25c. Entered at Chicago post office as second class matter.

#### The Honey Product of 1881.

We have great pleasure in presenting to our readers a very interesting Table concerning the Honey Product of 1881. It is very valuable, and will be exceedingly useful for reference. It has entailed upon us much extra labor and study; but few can even imagine the amount of brain work expended upon such a table. It rolls up into the millions. We would thank those who have so kindly sent their reports, and thus gave us the material with which to make the figures.

The average amount of surplus taken from the hives during the past summer is about 69 pounds, and the increase is about 71 per cent. Some colonies have each given as much as 400 pounds of comb honey. These were very rare cases, and evidently had the most favorable conditions.

The increase varies all the way from 8 to 140 per cent. California shows 8 per cent. increase, while Dakota shows New York and Kentucky each gave 72, Pennsylvania presents only 19, use. Michigan and Illinois each show 95, and Wisconsin 118. The curious may figure out many amusing results.

In the production of honey, New York takes the lead in quantity, followed by Pennsylvania, Canada, Ohio, Michigan, Wisconsin, Illinois and Louisiana, in the order named.

679

crease, and an average of 159 lbs. per the exact figures: colony in the spring, but more reports would, in all probabilty, greatly modify this result. New York shows a production of over a million pounds of comb honey, and is followed by other States in the following order: Michigan, Pennsylvania, Canada, Ohio, Illinois, Wisconsin and Iowa.

For several years past the crop has averaged only 35 lbs. to the colony, but this year we have nearly double (69 lbs.), so that those who lost 12 of their bees last winter, still have as much honey as usual from the half that remained last spring.

The 43 persons named below, commenced the season with 2.579 weak colonies. These have increased to more than double the original number, and have given 182,243 lbs. of extracted honey, and 95,144 lbs. of comb 130, and North Carolina 140, while honey as surplus, besides leaving 100, 000 lbs. in the 5,209 hives for winter

> The average per hive, of honey produced is about 138 lbs., and the fall crop will bring this to over 150 lbs. per colony. The amount taken from each hive averaging 10712 lbs. to every colony in the spring. Several of the colonies counted in the spring were from less than a quarter of a million, lungs, on the morning of Sept. 15. devoted to queen rearing, and of or one-twelfth of the whole. If the 1881,

There are in America about  $3{,}000{,}000$ 

one-twelfth that are reported are a fair average of the whole, then the crop of American honey for 1881 amounts to 120,000,000 of pounds. If we call it only a hundred millions, it is worth \$1,500,000,000. Surely the industry is of sufficient magnitude to satisfy the most enthusiastic of its de-

### . . . . . . The National Convention.

We devote much of our space this week to the first instalment of the proceedings of the National Convention, held last week. The Convention embraced much talent, and its deliberations were marked with dignity and harmony, and will be productive of much good.

Prominent among those in attendance were: Prof. A. J. Cook and T. F. Bingham, Mich.; Hon. W. H. Andrews, Texas; G. W. Baker and A. W. Windhorst, Mo.; Geo. A. Vincent, La.; Dr. J. P. H. Brown and lady, Ga.; Mrs. L. Harrison, Ill.; Mrs. F. Dunham, Wis.; F. Della Torre, Md.; D. A. Jones, Ontario; Nelson Perkins, Ala.; D. S. England, Tenn.; O. O. Poppleton, Iowa, Dr. E. Parmly, N. Y., and a host of Kentuckians.

Much of the success of the Convention is due to the unceasing labors of Mr. and Mrs. William Williamson, and Mr. J. R. Williamson, whose unbounded hospitality will not soon be forgotten. That they may prosper as they deserve, is the wish of all with whom they came in contact.

🖙 A mild winter, says the Cineinnati Commercial, is predicted by meteorologists. As the excessive heat of this summer is attributed to the increase of solar radiation, and that increase is due to violent disturbances in the sun's cromosphere, where spots of vast magnitude, following a period of quiescence, began to show themselves in May and have continued since, it is argued that the temperature in Arctic latitudes is, and will continue to be, above the average, and that comparatively mild currents of air will be wafted down upon us during the winter months.

We regret to announce that Signor Lucio Paglia, an extensive breeder of Italian bees, who has exported many of them to other countries of Europe as well as to America, colonies of bees, but our reports are died at Gaiana, of an affection of the

#### TWELFTH CONVENTION

OF THE

## North American Bee Keepers' Society

HELD IN THE

Odd Fellows' Temple, Lexington, Ky., COUMENCING ON

WEDNESDAY, OCTOBER 5, 1881.

President N. P. Allen called the Convention to order at 10 o'clock,

C. C. Coffinberry, of Chicago, Ill was appointed Recording Secretary

On motion the reading of minutes of last Annual Convention was deferred till the arrival of Dr. Parm-ly, of New York, Recording Secretary.

An amusing communication from B. Hix, Holly, Mich., was read.
Calling the roll of members and reading the Treasurer's report were deferred.
Vice Presidents' reports being in

order, the following were received:

Tennessee.—Vice President S. C. Dodge reports the winter of 1880-81, was one of unusual severity; the spring opened fine but late; bees were too weak to take advantage of nectar flow from fruit trees, white clover and tulip trees; my average being about 25 pounds of honey from spring bloom. The summer was dry and forage very The summer was dry and forage very poor. Colonies robbed late in spring scarcely recovered in time for fall bloom. Now breeding rapidly from fall honey. Honey is now coming in nicely. I expect an average of 30 pounds of fall honey per colony. I have effectually eradicated foul-brood from my apiary; and after disinfecting them am again using the bives ing them am again using the hives and frames.

Arkansas.—Vice President W. W. Hipolite, M. D., reports only about 25 pounds per colony, owing to the pro-longed drouth; increase was mode-rate; bees are in good condition. In-stead of organizing State and district associations, I have made formal application to have the bee-keepers in this State incorporated with the Arkansas State Horticultural Society for that the request will be granted. With some slight changes, our State Fair Association will continue the premium list which they last year offered for bees, honey, etc. The fair will be held from the 17th to the 22d of October. As bee-culture becomes better developed in this State, I think there will be little difficulty in getting an offer of larger premiums. I trust your meeting may be one of harmony, and result in great good.

Indiana.-Vice President Rev. M Mahin reports the winter of 1880was one of the most disastrous to the bee-keeping interest since I have been a keeper of bees. In all parts of the State the losses were very great, and in some counties almost total, some reason which I am not al some reason which I am not able to explain, the mortality was greater in the Southern portion of the State than in the more Northern. I am not able to give with any certainty the percentage of loss, but I judge for the whole State it was not less than three-fourths. Many lost all they had. In the Northern half of the State the season has been very good. I have never before known basswood to yield so abundantly. The swarming fever ran very high, and those who were wise enough to save and use the combs of the bees that died, or to use comb in the more Northern. I am not able wise enough to save and use the combs of the bees that died, or to use comb foundation, have had a very satisfactory increase. In this, the northern central portion of the State, the generally prevalent drouth did little to honey and bees in this State. I think I can safely say there are not more than 200 or 300 colonies in Madisoney all the season. The fall crop is light, but the early crop was so very large that we have abundant reason to be satisfied. In Southern Indiana

the drouth has been very severe, and I suppose that the bees are not in good condtion for winter. In this portion of the State there is great room for improvement in bee-culture. So far as I know, I have the only honey extractor in this county, and good movable-comb hives are scarce. Bee-keeping has been damaged by vendors of patent bee hives, the patfeatures of which are their worst ones.

Georgia.—Vice President Dr. J. P. H. Brown reports that as there are no regular statistics kept by the Agricultural Bureau of Georgia of the number of colonies of bees, and of the amount of honey and wax pro-duced, it is very difficult to arrive at any very accurate results. I can only give approximate estimates based upon the last report of the Com-missioner of Agriculture upon the subject. I place the number of colosnoject. I prace the number of colo-nies at about 7,000, and the honey pro-duct at 144,000 pounds, which would only be 20 lbs. per colony. The sea-son has been favorable for the flow of honey, and above an average. The most abundant yield was in May, after this the drouth set in which checked the flow until the rains in July. The fall harvest bids fair to be good, and all those colonies that are strong will lay up surplus above their winter sup-plies. I estimate the amount of beeswax at 8,000 pounds. Fully 80 per cent, of the bees are kept in the oldfashioned box-hives. Movable-frame hives are gradually coming into use, Movable-frame and will be more extensively used as correct apiarian knowledge is more

disseminated.

Kentucky.— Vice President Wm. Williamson reports the losses the past winter in Kentucky at fully 50 per cent.; some appear to have been more successful than others, and it does not appear to have been from lack of scientific treatment, because those who have the least experience, or given the least attention to them, have in some instances been most successful. The long-continued drouth of this summer destroyed the bright prospects of the early honey season. The flow of the early honey season. The flow of honey for a week or two was abundant, rich, and of delicious flavor, and for the number of colonies would yield about 75 per cent. The increase in colonies has been fully 100 per cent. The prospects for next season seem to The prospects to hext season seem to indicate a bright future. The recent rains have refreshed vegetation so much that bees are again gathering honey, and will go into winter-quarters well supplied.

Canada.— Vice President D. A. Jones reports the present season as an average one for both honey and increase, and although it has been very dry since July, completely cutting off the fall honey yield, bees are in fair condition for wintering. Honey sells readily at fair prices, and the outlook for bee, keepers was never heighter in for bee-keepers was never brighter in Canada than at present.

Nebraska.-Vice President Geo. M Hawley reports the losses from out-door wintering at fully 75 per cent.; the losses from cellar wintering 10 per cent. The early season proved favorable, and bees increased rapidly. Later, some sections were affected with local drouths, and but little surplus was obtained, while other portions will secure a full harvest. Should estimate the crop of the State at  $^3_4$  of a full yield. Our principal yield of honey has been from Polygonum persicara (hearts ease), goldenrods and silkweed. In the vicinity of rivers or but the former are everywhere present. The quality of the honey is good, and bees are generally in good

condition for winter.

Alabama.—Vice President James

A. Austin reports: I have endeayored to find out all 1 could in regard

Maryland,-Vice President S. Val-Maryland.—Vice President S. Valentine reports: I regret I have not been able to get the statistics of the State of Maryland. As far as I can learn, I cannot report much over half a crop of honey, if any, for the State of Maryland for 1881. Owing to the mortality among the bees last winter, and the irregular flow of honey this senson, it is impossible even to any season, it is impossible even to approximate an estimate of the honey proximate an estimate of the honey crop of our State. I learn from various correspondents in different localities, that the flow of honey has been very irregular through the State—some sections very good while others are poor. I am of the opinion that the clover all through the season secreted are all phyndroge of honey creted an abundance of honey, throughout the State, and the failure in the different localities was owing to the prevalence of heavy rains in the early part of the season, which washed the honey from the blossoms. Following are statistics for Carroll county for 1879: Honey, 13,977 pounds and wax, 455 pounds. Taking Carand wax, 455 pounds. Taking Carroll as an average, would give the State of Maryland 307,497 pounds of honey and 10,010 pounds of wax for 1879. I trust your Convention may be a grand engaged.

1879. I trust your Convention may a grand success.
Kansas.—Vice President Norton reports there is no surplus in Kansas, unless it be in the Eastern tiers of counties along the Missourier river. Any surplus in his locality is usually from the fall flowers, which the drouth has prevented for this season. It seems to me a printed circular, set-It seems to me a printed circular, setting forth the objects of the Society, for distribution by the Vice Presilents among the officers of the various Fair Associations, would be the most practical and effective manner of reaching the intended objects and production of honey, and its importance to the country in a commercial view, with reasons why that production should be stimulated and encouraged by the offering of liberal premiums by the several Fair associations of the country. I would suggest that Mr. T. G. Newman be requested to write it. He could certainly afford it, as the extension of scientific beeright as the execusion of scientific because the circulation of the Bee Journal. Since my residence here, now four years, the Journal has quite a good circulation, whereas, before I came, not a copy came to the county so far as I know. I wish the Society a successful and profitable meeting.

The reports were accepted and ordered to be placed on file.

On motion, the reception of the President's annual address was post-poned till the afternoon session. On motion, adjourned till 2 p. m.

AFTERNOON SESSION.

The President, Dr. N. P. Allen, of Smith's Grove, Ky., addressed the Convention as follows:

Ladies and Gentlemen .

In obedience to a time-honored custom, I am before you to deliver the opening address as presiding officer. Another year of labor and toil, of

joys and sorrows, of successes and disjoys and sorrows, of successes and disappointments, has passed since we last met in council and grasped each others' hands, and with sympathetic hearts enjoyed the social greetings of our co-laborers in the broad field of apiculture. We have great reason to be thankful to Him who presides over the minyerse the disposars of all blass. the universe, the dispenser of all blessings, that our lives are spared and we

are so favorably surrounded.

The past winter was marked by extreme long-continued cold, and thousands of colonies of bees were lost in consequence; not only bees died, but animals perished in many parts of our northern latitudes: nor was man altogether exempt from suffering and death caused by the rigorous weather.

But in due time the spring sun poured its life-giving rays upon the earth, melting away the snow and frost. The trees put forth their leaves. frost. The trees put forth their leaves, the grass shot forth its delicate spears and covered the earth with living honey, and the making of laws to pro-

green; the flowers opened and filled the air with sweet fragrance, and all nature seemed glad with joy, while the hum of the busy bee was heard in the land, filling the heart of the beekeeper with delight as he beheld the

lovely sight.

But the spring-time and summer have passed and the harvest is ended, and we are here to recount our successes and failures-to learn one from

another.

Life is made up of toil and labor, of pleasures and sorrows, hopes and fears, happy-realizations and sad disappointments—not more so with the a than with other pursuits; yet, he has a fair field in which he can experience all these different phases of life.

The object of this Association should of rational bee-keeping; to bind the brotherhood of bee-keepers together as with cords of love and fraternal feeling; to do all in their power to develop the honey resources of the country, to let their light, ships, so that try; to let their light shine so that ignorance and superstition may be dispelled from the land, and a correct system of cultivating the honey bee be the order of the day, that all who keep bees may be rewarded for their labor and by studying the works of labor, and by studying the works of nature in the economy of the bee hive, be elevated in their minds from nature's works to nature's God, and thus be made better citizens and better

I had hoped to have a valuable sta-tistical table from every State and Province; but from causes over which I had no control I am not able to pre-

Many and varied are the reports of the honey crop. In some States and localities the winter's disasters and the summer's drouth have been so severe as to almost ruin bee-keeping as a profitable business, while in other States and localities bees wintered without serious loss, and the spring and summer harvests were such that good crops of honey were gathered; and in favored spots large yields of honey are reported. May we not hope for a favorable winter, and a rich harvest for our bees the coming year?

Since the invention of the movable frame, by our illustrious co-laborer, the Rev. L. L. Langstroth, in 1855, scientific bee-keeping has been on the increase, and the command of God to man to go forth and subdue the earth, is the watchword among bee-keepers—as the moyable frame gives him conas the movable rather gives indicon-trol of the labors of the honey bee in comb-building, brood-rearing and hon-ey-gathering. The intelligent bee-keeper directs the labors of his bees as keeper directs the labors of his bees as he chooses. If he wants the delicate comb honey, as white as snow, he can have it by the use of honey boxes and sections; if he wants the pure liquid nectar just gathered from the delicate flower cups, with the sweet fragrance and rich aroma of the flowers from which it was gathered be one obtain which it was gathered, he can obtain it by the use of the honey extractor. If he wishesto increase the number of colonies, he can do it by artificial swarming and the use of comb foun-dation. The bellows smoker enables dation. The bellows smoker enables us to subdue and control our bees while manipulating them.
The new races of bees that have been introduced have done much to further

the cause of scientific bee-culture. All of the different races are here on exhibition, and we may learn much of their relative merits. We have the German or black bee, the graceful Italian with her rings of gold, and the albino, so light and beautiful. The Cyprian and Syrian bees that have recently been introduced from the Island of Cyprus and from Palestine are also on exhibition. We had boned to laye exhibition. We had hoped to have Apis dorsata also, but have not.

I would earnestly recommend for your consideration, the importance of

some consideration, the importance of encouraging State, District or County Societies; the State or Province Societies should be auxiliary to the North American, and the District or County to the State or Province.

hibit it. I believe that all articles of food and medicine should be sold under their proper names, and as honey is used both as food and medicine, I recommend that you take such action as in your wisdom may seem best to bring about the end desired.

Several valuable inventions in useful tools and implements have been made the past year, and quite an ad-vance in our bee papers and literature is to be seen—new ones being issued, is to be seen—her ones being issued, older ones enlarged and made more attractive. The American Bee Journal, published by Thos. G. Newman, Chicago, Ill., is now printed weekly, and is the only weekly paper in the world devoted exclusively to bees.

I return thanks to all the bee papers for publishing the notice of this meeting; also to the committee of arrange-ments, for their labors in getting the use of this hall to hold our sessions in, and for obtaining hotel and railroad

A programme has been printed and distributed for use at this meeting; I return my thanks to all those who

In eonclusion, allow me to thank you for the honor of presiding over your Association the past year. I have spent both time and labor in furthering its interests with the hone nave spent both time and labor in fur-thering its interests, with the hope that it would prosper under my admin-istration, and that this meeting would be the best ever held in the Western World. May your deliberations be pleasant and profitable to all present.

Dr. E. Parmly, of New York, Recording Secretary, having resumed his official duties, read the minutes of the last annual Convention, which were

approved.

The selection of a committee on nominations being in order, O. O. Poppleton, Iowa, moved that the President appoint the committee.

Carried.

President Allen appointed as said committee: Hon. W. H. Andrews, McKinney, Texas; Hon. G. W. Demaree, Christiansburg, Ky.: O. O. Poppleton, Williamstown, Iowa; F. Della Torre, Reisterstown, Md.; and Dr. J. P. H. Brown, Augusta, Ga.

Prof. A. J. Cook, of Lansing, Mich., delivered the following able address:

#### The New Races of Bees.

The New Races of Bees.

A little less than two years since, as is well known to all, two American gentlemen D. A. Jones, of Canada, and Frank Benton, of Michigan, started for the old world in quest of new races and species of bees, in the hope that they might discover and introduce into America some new and valuable races or species. After visiting the principal apiaries of Europe, they located in Cyprus, where they established a large apiary in the city of Larnaca. Mr. Benton remained in Cyprus in charge of the bees, which consisted of two distinct varieties, the Cyprian and the Syrian, while Mr. Jones returned to America in June, 1880, bringing a large number of the queens of the two races with him.

The following winter Mr. Benton proceeded to Ceylon and Java, hoping to find "the great bee of Java," Apis dorsata, and perhaps others that were valuable. His quest on the Island of Java was very thorough, but utterly fruitless. No sign could he see or word could he hear of the great "Javan bee," Apis dorsata. It was not there, and Mr. Benton gained the expensive information that the name Java, as applied to this species, was a serious misnomer. His search in Ceylon, how

personal knowledge, I will confine the bal-

personal knowledge, I will confine the balance of this paper to them, reserving the description of the other species and race for a future occasion.

The Syrian bees are of the yellow Type, and so are closely related to the Italians. Indeed, there are reasons to believe that these latter bees are the modified offspring of the Cyprians, which as probably were the descendants of the Syrians.

The queens of this race are remarkably uniform in coloration, and thus appearmore fixed as a variety, than do the Italians, whose queens are quite variable in color. This uniformity is so striking that of 20 Syrian queens which I have reared, it is next to impossible to distinguish one from another. The head, thorax, femiora, and bands on the dorsal surface of the abdomen are black. The abdomen above is brown or leather-color, while the legs, except the femora, and the under side of the abdomen are a little lighter. The black bands on the back border posteriorly the segments from the 2d to the 5th inclusive. They broaden from before back to the last, which nearly covers the 5th segment. The 2d and 3d bands are a little broadest in the middle, and the last segment is wholly black. In form the Syrian queens are essentially like the Italians, nor do they differ in size.

The drones are black above and yellow-

The drones are black above and yellow-ish-brown beneath. The legs are black. Each segment of the abdomen is bordered Each segment of the abdomen is bordered above posteriorly with goiden brown. Olive brown hairs cover the thorax above, while beneath the thorax on the under side of the head, and at the base and tip of the abdomen, the hairs are of a lighter hue. These drones are also unlike the Italian drones in their wondrous uniformity. Each seems exactly like every other. The Syrian and Italian drones do not differ in form and size. In breeding these bees, I have had striking proof that impregnation has no effect to modify the drones. The first 4 queens that I reared must have mated with Italian drones, as there were no others in the apiary, and no Syrian drones in the State. Yet of a great number of drones from these queens, not one was seen that did not show the marks of a pure Syrian in every respect.

one was seen that did not show the marks of a pure Syrian in every respect.

The Syrian workers are like those of the Italians, except that they are more yellow beneath; this color prevailing to the last segment which is dark. The young Syrians, just as they come from the cells, appear very dark. This peculiarity furnishes the readiest means by which to identify these bees when there are no drones in the hive. The workers are a little brighter than are the Italian workers, and perhaps a trifle smaller. The tongue of the Syrian worker, I find, after examining a large number of each kind, to be the same length as that of the Cyprian, and to average, 006 of an inch longer than that of the Italian, and more than .02 an inch longer than the tongue of the German worker.

I have found the Cyprian bees to be very

ian worker. I have found the Cyprian bees to be very

A little less than two years since, as is well known to all,two American gentlemen D. A. Jones, of Canada, and Frank Benton, of Michigan, started for the old world in quest of new races and species of bees, in the hope that they might discover and introduce into America some new and valuable races or species. After visiting the principal apiaries of Europe, they located in Cyprus, where they established a large apiary in the city of Larnaca. Mr. Benton remained in Cyprus in charge of the bees, which consisted of two distinct varieties, the Cyprian and the Syrian, while Mr. Jones returned to America in June, 1880, bringing a large number of the queens of the two races with him.

The following winter Mr. Benton proceeded to Ceylon and Java, hoping to find the great bee of Java, "Apis dorsata, and perhaps others that were valuable, this queets on the Island of Java was very thorough, but utterly fruitless. No sign could be see or word could he hear of the great "Javan bee," Apis dorsata. It was not there, and Mr. Benton gained the expensive information that the name Java, as applied to this species, was a serious misnomer. His search in Ceylon, however, was better rewarded, as he procured on this island, after severe labor, great privation, and serious hardships, which came near costing him his life, two news process of Apis; the large dorsata which fastens its immense combs, all exposed, to the underside of the branches of trees; and the minute florea, which nests in the hollows of trees and rocks, as do our common bees. The comb of Apis dorsata is very thick and heavy, while that of A. Morea, some of which I have received through the kindness of Mr. Benton, is very delicate and beautiful. The cells are 'gless in diameter than are those of our common bees.

Lyon the arrivation of the new queens in America, I at once procured one of the Syrians, and Syrianized the entire apiary at the Michigan Agricultural College, as then could learn their peculiarities with much more certainty than though I kept several races.

Rev. L. Johnson, of Wallon, Ky., thought orders for Cyprian and Syrian queens should be sent to Mr. Jones, in order to remnucrate him in part for his outlay of time and money to seoutly of time and money to se-cure a superior and pure race of bees for dissemination in this country. The bees mentioned are good natured if properly handled.

Prof. Cook thought a substantial recognition of Messis, Jones and Ben-

cognition of Messrs. Jones and Ben-tion's ardnous and hazardous labors in this behalf should be made by the bee-keepers of North America. G. W. Demaree, Christiansburg, Ky., was satisfied that there are two races of bees—the yellow and black. All the races of yellow bees are un-doubtedly derived from the same par-out steek and all variations which are ent stock, and all variations which are apparent are the result of climatic influences. Mr. Demarce said he had better results in rearing queens from fresh eggs than from larva. He found, where giving larva already hatched from which to rear queens, the queens are always darker and their workers not so fine.

1) A large was of the opinion ent stock, and all variations which are

D. A. Jones, was of the opinion there were but two races originally—the Syrian and the Dalmatian bees. He thinks the Syrian bees were taken to Cyprus from Palestine, and from Canyon to Italy where they came in Cyprus to Italy, where they came in contact with the Dalmatians, and by acclimatization they formed the presacclimatization they formed the present Italian bees, which have become a fixed race. He has known nearly 250 queen-cells to be constructed in one hive by the Cyprians. A neighbor in Canada claims that the Cyprians gathered an average of 20 pounds

honey per colony than the Italmore ians did. C. Coffinberry, Chicago, 111., read

# a paper on the subject, "Can we make honey a staple product." as follows: Can Honey be made a Staple Product?

Since bee-keeping has emerged from the Since bee-keeping has emerged from the mysterious labyrinths of superstition which popularly surrounded it and been allotted a high position among the scientific arts, the great obstacle which, till quite recently, attended its successful pursuit and development has been an outlet or market for the surplus production above the quantity actually required for home consumption.

in the recently attended its successful pursuit and development has been an outlet or market for the surplus production above the quantity actually required for home consumption.

This, however, having been overcome, the next serious question which arose in the minds of some of our most successful producers was the fear of glutting the market; but thanks to an intelligence market but thanks to an intelligence market as great as our own, this fear has been allayed, and a demand has spring up abroad which we frankly acknowledge we amous tastify, until we can make honey a staple production. By "staple production," I mean when its supply will average, one year with another, as will pork, or order, or butter, or cheese, or wheat, or corn, or any other product that is dependent alike upon the seasons and the intelligence of the producers.

Contemporaneous with the fear of glutting the market, was broached the subject of the producers.

Contemporaneous with the fear of glutting the market, was broached the subject of the producers.

Contemporaneous with the fear of glutting the market, was broached the subject of the producers.

Contemporaneous with the fear of glutting the market, was broached the subject of the producers, which is continued to the subject of the product of the pro

"because it will not pay." Perhaps, once in a while, some neighbor has put in a field of buckwheat, or nature has been lavish, and the bees, true to instinct, have done well—as they always will if the opportunity is provided them.

But Mr. O. O. Poppleton, of Iowa, can tell you truthfully that his bees average, per colony, the product of an acre of wheat; Greiner Brothers, of Naples, N. Y., realized equivalent to two acres of wheat from each colony; Alderman & Roberts, Wewahitchka, Fla., have realized this season enough to purchase an acre of land for each colony. Many others have done quite as well; and why? Because they have had almost continual bloom. It is not my intention to suggest what to plant, but to provoke the questions: Should we not plant to secure a continuous bloom? and with a continuous bloom of judiciously selected plants, Can we not make honey a staple product? When every year becomes an extra good honey season, instead of every fitth year, will not honey have become a staple product? If thirty days of good honey flow will constitute the average honey season one with another, will not four times that number of days every season (which I believe can be realized by judicious planting), not only make the product a staple one, but apiculture will become one of the most pleasant, most certain, and most profitable pursuits we can adoot.

When we have learned what to plant, when to plant, and how much to plant, then, too, will we have overcome the greatest difficulty in wintering, and we will hear no more of bees starving. Our honey will always be the best, because we have robbed nature of the privilege of making the selection. Our colonies will always be strong, from early spring till late in the fall, for we have allowed no cessation in honey flow. Our ramifications for newer and better bees will cease, for our beantiful American-Italians will only be forced to "jump over the fence and help themselves;" and our hybrids and blacks will become morally and socially better, because not forced from inta

T. F. Bingham, Abronia, Mich., inquired of Mr. Coffinberry how much buckwheat would be required for a given number of colonies?

About 65 per cent, of the number of colonies of last fall were dead by May 10, and more of them died between Mar. 20 and May 10 than had previously. Many that had pulled through till May 1, became queenless and died out or swarmed out, or had drone-laying or virgin queens before

had pulled through till May 1, became queenless and died out or swarmed out, or had drone-laying or virgin queens before June 1.

Both soft and hard maples were full 3 weeks later than known before in these parts, but most of the bees were in condition to obtain but little honey from either. Fruit bloom was nothing to speak of. May 25, white clover began to show considerably in favorable localities, but yielded very little honey. Very little, if any, surplus was stored in boxes till basswood, which commenced blooming July 15, the bloom being plenty and yielding honntifully till the 28th; before basswood was gone, sumac began to bloom abundantly, and yielding honey steadily and bounfitully till Ang, 5, when the harvest shut off so abruptily as to make it dangerous to open weak colonies or nuclei until luckwheat began to bloom, which was Ang, 22, in some places yielding a fair supply, in others scarcely enough to keep off starvation, and in many places not any. When any amount of honey was gathered it was from the silverhull, the common kind was worthless for honey. The early golden-rods and other early fall flowers amounted to nothing for honey; on the 20th of Sept. bees began to gather a little honey, and the yield showed a steady increase daily. On the 24th it was so heavy that should it continue for 2 weeks as plentiful, the colonies completely destitute could gather enough for a winter supply. The queens had almost come to a stand-still regarding laying, but the past 3 or 4 days, good flow of honey has given them a start, which it is to be hoped will furnish brood enough to send them into winter quarters moderately strong in bees. In the north-western and western parts of the State, there is a slight showing of a disease in the brood. Just before ready to cap, a large percentage of it turns a yellowish brown, and then dries up. Whether it is caused by a poisonous honey, or the weather, or the drouth, or all three, I cannot tell. The trouble is mostly on low ground or near large swamps. It is contagious by th

The report of the committee was accepted, and on motion of O. O. Poppleton, the Recording Secretary was instructed to cast the vote of the Convention as a unit for the above nominees, after which they were declared unanimously elected.

Prof. A. J. Cook, President elect,

vas escorted to the chair, and delivered the following:

#### President's Address.

Ladies and Gentlemen of the American

Ladies and Gentlemen of the American Bee-Keepers' Soviety: Allow me to thank you most cor-dially for this unsought and unexpec-ted honor. To receive this kind and manimous expression, is indeed most pleasant. Two years ago I urged Cincinnati as the place for the succeeding meeting. I wished to enlist the interest and quick intelligence, and secure the rich fruit of the experience of our honored bee-keepers of the Sunny South. One year later the selection of Lexington wisely furthered the same object. To-day we are proving the wisdom of this idea. We have heard before of the kind-heartedness and exceptional hospitality of the people of this grand old State. To-day we are

realizing that it is more than true.

I have long felt a sincere pride in doing what I could to advance api-I have long felt a sincere pride in doing what I could to advance apiculture. The apiarist produce apiculture. The apiarist producers his reward, not by sharp practices, not through the misfortunes and adversity of his fellow, but by the honest production of that which is of value to others. His daily work adds to the capital of the world; the fruits of his daily thought and labor add to the comfort, the health, and the happiness of the world. More, when we lead amy friend or neighbor to apicultural pursuits, we are working matirectly to cultivate in them thought, study and close observation, for without each and all of these, the best success is impossible. But intelligence and observation are more than elements of secress; they make life a joy, and their possessor a delight and a blessing to others.

Apiculture calls its patrons to handle the things of nature, and soremines, elevates, and broadens. How patent the fact, as we associate with bee-keepers in these conventions, that this pursuit developes charity, rever-

fully fertilize queens in continement, enee-yea, the truest and best ele-

ments of a gentleman.

In apiculture, our sisters find the means to procure a comfortable livelihood. That apiculture is peculiarly adapted to the defi manipulation and the neat and beautiful taste of our ladies, is more than demonstrated by the many successful lady apiarists of America, who are second to none in

America, who are second to none in the land.

To be called to succeed such men as Allen, Newman, Quinby, and the honored Langstroth, is indeed something to awaken pride; to be called to represent the American apire. culturists, as the chief officer of their national association, is indeed an honor of no small magnitude.

Asking your aid, unflagging support, and your kind forbearance, I promise to do what I can to make the coming year of this association even more fruitful of good to American beekeepers, if that be possible, than has been any time of the past. With "Excelsior!" as our motto, let us proceed to our regular work.

The following resolution was offered by C. C. Coffinberry, of Illinois, and adopted unanimously, by a rising vote:

\*Resolved\*, That we hereby tender the thanks of the North American Bee-Keepers' Society, to our late President, Dr. N. P. Allen, Kentneky, for the excellent and efficient discharge of his official duties during the past most trying year to bee-keepers.

The following address from P. P.

The following address from P. P. Collier, of Missouri, was read:

#### About in-and-in-Breeding.

About in-and-in-Breeding.

In discussing this very important branch of apiculture. I deem it prudent to confine myself to facts long established and proven, that too long and too close "in-and-in-breeding" is determental in all domestic animals, as well as the honey bee. It is one of God's established laws in all animate beings to avoid the relative or kindred bloods, and the penalty in the violation of this law, the careful breeder is ever watchful to prevent in the species propagated. While it is a fact that some of the ancients advocated "in-breeding" to retain the original purity of the "bovine animals," yet the proof of this policy is developed in all cases wherever practiced, not only in maintaining the original, but running out of mixed bloods, and, while we believe that this law is applicable to all domestic animals, it is none the less true in the honey bee, as probably with all insects.

My father once purchased 4 colonies in

all insects.

My father once purchased 4 colonies in My father once purchased 4 colonies in log gums from two different men. For 2 years his increase was very rapid, his bees doing well, but the third year they became indolent—no honey—moths attacked them, and in 2 years more he had nothing letticave the "gums." There were no other bees near for them to cross with, but they bred in-and-in until they bred "out." I was called, a tew years ago, to transfer 18 black colonies from the old box to the movable frame hives. I did so, and found the bees very indolent; queens and dromes dwarfish, bees idle with little resentment, and although put there in good order with a good harvest, yet they went to nothing. Another case about the same time, and under similar circumstances, was giving

Another case about the same time, and under similar circumstances, was giving queens from a distant apiary (all blacks) with very different results; the close of the season tound them strong and vigorous, not a moth about them.

Some 50 years ago, a French writer advocated the exchange of brood from a distant apiary, to prevent "in-breeding." Mr. Dadant, on page 270 in the AMERICAN BEE JOURNAL refers to a case of marked aziness in bees propagated and sold in one locality, all from one colony. He further said, "According to my experience, too close and too prolonged in-andin-breeding will produce laziness, and

"was this not a marked case of degeneracy from in-breeding?" I then procured queens from different breeders—reared drones from one, and queens from others, with very different results.

How did man obtain the perfection developed in the various animals under his control? I answer, by taking advantage of this law, with the variation and preserving them, or developing the more perfect, and rejecting the imperfect. Now with no variation, there can be no selection, but happily our great Creator has provided ample provisions by the which kindred blood, and the penalty thereof may be avoided, and a better and purer race adorn the many apiaries that exist in our broad and glorious land to the pleasure and profit of all concerned. But permit me here to say, that so long as this dollar-queen business is tolerated, so long may we expect perfection deferred, and a mongrel race flood our country. Why, what may we expect from a stock-raiser to advertise his fine cattle without warrant or guarantee of their purity? Would you purchase of such? Yet thousands of novices are led to believe that they have the "ne-plus-ultra," to their great injury.

Dr. E. Parmly, New York, maintained that there was not the danger to be apprehended from in-and-inbreeding, that was generally anticipated. The doctor exhibited a photograph of the most celebrated milch cow now in this country, stating that her extraordinary yielding powers had been developed by in-breeding, and that it was a rule among the best stock-breeders to breed in twice and out once; sometimes they breed in-and-out time about. He claimed that climatic influences had more to do with deleterious results than the system of in-breeding with bees. Take, for instance, the human family, and it would be found that some nationali-fies were not so liable to degeneracy as others. A nervous, excitable peo-ple like the Americans would be more likely to degenerate than a stolid phlegmatic people like the Hollanders. According to the theory of partheno-genesis, a queen could not mate with a full brother—the nearest relation-ship the drone could bear would be that of a half brother, and hence their peculiar natural organization was by nature adapted for breeding in.

An address from C. P. Dadant, of Hamilton, Ill., was next in order, entitled

#### The Prevention of Natural Swarming.

The Prevention of Natural Swarming.

Among the most desirable improvements to be made in the wide unexplored field of bee-knowledge, is the management of bees in such a way as to produce at will, either bees or honey. One-half of this question has already been solved satisfactory, it is that which concerns the production of increase in colonies at the expense of honey. Indeed this matter has been so thoroughly ventilated, that it has become a necessity for the older heads to warn the novices against an excess in this line, and notwithstanding these warnings, we daily hear of failures of beginners due to the over-production of artificial swarms in their too great eagerness to quickly become large honey producers. The other side of the question, and not the least important to the large producer, is far from being so thoroughly solved as the former, and although we see many instances where bees do produce honey without swarming, there are numberless instances where the bees have swarmed again and again, producing a large increase in swite of the offerts of the first weener.

causes of natural swarming. Allow us to lay down a few rules which we will develop afterwards in regard to these causes. The swarming impulse is generally found: 1st. In a colony of bees that contains a large amount of drone comb, in which drones are reared early in the season.

2d. In a colony containing an old queen or a queen who is losing her proliticness on account of age or some other reason, and whom the bees try to replace.

3d. In a colony that has most or all of its comb occupied with honey, brood and pollen, even if that colony has a large empty space left.

its comb occupied with honey, orom ampollen, even if that colony has a large empty space left.

4th. In some colonies that have already swarmed a few days previously, or in colonies that have prepared to swarm, even if the colony has been divided, when their intentions were discovered by their keeper.

Let us bear in mind that we must always have in view the nature of the bee, whenever we inquire into this question of

whenever we inquire into this question of swarming, as it is only through their natu-ral instincts that we can control them.

swarming, as it is only through their natural instincts that we can control them.

In regard to the first question, nearly all the old box-hive bee-keepers will tell you that a colony that rears many drones is more apt to swarm than one that does not rear any. Bee-keepers however, differ in their explanation of the influence of the drones in this case. Some hold that when the bees intend to swarm, they rear drones largely, to provide for the fertilization of the young queen. Others say that drones are only reared in good seasons and that in such seasons the bees are more apt to swarm. We incline to think that although both of these reasons have weight in the matter, the main influence of the drones on swarming is due to the fact that they bother and annoy the bees with their useless presence, and help to make the colony uncomfortable by their running and tumbling right and left in the busiest useless present, an experience and tumbling right and left in the busiest time of the day, and especially by generating a considerable amount of heat, without ever helping even to ventilate the

Be this as it may, we can safely say and our readers will agree in this, that to reour readers will agree in this, that to move all or most of the drone comb to place it with worker comb is one of requirements for the prevention of natu-

requirements for the prevention of natural swarming.

The second question in regard to the age of the queen, will perhaps not seem so plain at first sight, and still we consider it as very important. Most beekeepers know that when a queen losessome of her prolificness, the bees usually build queen-cells to replace her. They do not always wait till she is too old to be of further service, but sometimes try to replace her when she is still vigorous and only somewhat decreasing in her laying capacities.

In such instances if the young queen is reared during a searcity of box

only somewhat decreasing in her laying capacities.

In such instances if the young queen is reared during a scarcity of honey, they sometimes keep the two queens side by side for weeks and perhaps months, but when this queen-rearing is attempted during the honey months, it is an impetus to the swarming fever. The old queen then leaves with a swarm and this colony having acquired the swarming impulse will swarm again and again, sometimes to the bee-keeper's detriment and also to its own loss. On the other hand if the colony has a young profilic queen which they do not wish to replace, they will not build queen-cells unless other causes force them to it.

The third question is the main one in the case, and the cause of most of the swarming. Not only will a colony swarm when the hive is full of combs, but very often also when all the comb in the hive is full, even if the hive be only partly filled with comb. In this latter case, the cause is undoubtedly to be found in the fact that when the harvest is very plentiful the bees find every corner crowded and have to remain idle in order to digest the honey and transform if into comb. This is an annoyance to them undoubtedly, and they make preparations for swarming. But we have never seen bees swarm when enough empty comb had been prolow can we account for this state of often also when all the comb in the hive is full, even if the hires he only participated as the considerate of the many and the comb in the highly covered and have to remain bile in order to digest the state of the hires. Bees set and only the highly covered and have to remain bile in order to digest the honey and transform it into comb. This is an annoyance to them undoubtedly, and they make preparations for swarming flut we have preparations for swarming flut we have more them the highly covered the swarming fever however, from some cause or other weakness or honey have seen on the comb the band been provided for them from the hegiming of the swarming fever however, from some cause or other weakness or those when divided to have the same to prevent their swarming fever however, from some cause or other, we have except even able to fine one of the swarming fever however, from some cause or other, we have except even able to fine one of the swarming fever however, from some cause of the swarming fever however, from some cause or other, we have except been able to fine one of the first practical lessons at somethness when divided up in 3 or a pieces each of these divisions would cast a swarm and make things only worse. It is, therefore, very important to have these some begins of the state of the substitution of the control of the first practical lessons to be the substitution of the control of the first practical lessons to be the substitution of the control of the first practical lessons to be substituted in the control of the first practical lessons to be the substitution of the control of the first practical lessons to be substituted in the control of the first practical lessons to be substituted in the control of the control of the first practical lessons to be substituted in the control of the first practical lessons to be substituted in the control of the first practical lessons to the control of the first practical lessons to be substituted in the control of the first

box-hive bee-keepers, the present season especially, having more than doubled their apiaries, and we have been enabled to keep the natural swarming to about 3 or their east.

4 per cent.
Discussion helps progress. In the foreonscussion neips progress. In the fore-going we only give our experience in the matter and now desire to hear of the ex-perience of others. Such is the aim of this essay.

Hamilton, Ill.

Rev. L. Johnson, Kentucky, does not favor dividing or artificial swarm-ing. When a colony develops a swarming tendency, he removes it to a new stand and places an empty hive on the old one, in which he puts a queen-cell or traine of eggs and larvæ.

T. F. Bingham, Abronia, Mich., thinks the giving of empty combs will not prevent swarming—that the size of the hive has nothing to do with swarming

C. F. Muth, Cincinnati, Ohio, thinks that swarming is easily controlled by extracting from the brood-chamber. In running for comb honey they cannot be so easily controlled at all times. Rev. L. Johnson does not think the

of drones has any influence presence

on swarming. Messrs. Muth and Cook agreed with Mr. Dadant in thinking that drones do exercise an influence.

H. C. Hersperger, Keene, Ky., has seen bees swarm under almost all cir-cumstances; but thinks swarming is mostly attributable to the existence of uncomfortable conditions in the hive.

ancomfortable conditions in the nive. At times, however, the swarming propensity seems almost unaccountable. Prof. Cook explained his method of measuring the length of the tongue of the honey bee. It is done by placing feed on the surface of a pane of glass, then covering with a surface of wireleast, being and being elevated about then covering with a surface of wire-cloth, one end being elevated about one-half an inch. By this means he can get the tongue extruded its full length when he suddenly decapitates the bee. By this means he can meas-ure it, with the aid of his microscope, to the exactness of one-thousandth of to the exactness of one-thousandth of an inch.

G. W. Demaree, of Kentucky, addressed the Convention on the

#### Obstacles to Progressive Bee-Culture.

Bee culture, as a science, has made won-Bee culture, as a science, has made won-derful progress in the past few years, keeping fully up with the improvements of the age. But alas! how few, compar-atively speaking, have profited by the flood of light that has flashed from the peus of the many able writers who have espoused the cause of the long-neglected honey bee. Other branches of industry have pros-pered, and held out their lights to the busy world, which has been grashed and appered, and held out their lights to the busy world, which has been grasped and appropriated by it. Bee culture prospers also, but it prospers as a "science," more than as an industry. The part it has played so far, as an industry, is the playing of the part of a "light in a dark place." A well ordered apiary, managed intelligently, in which the apiarist avails himself of all the helps and improvements used by progressive bee-keepers, is a novelty in most any community.

How can we account for this state of things? Bee scientists are the most communicative class of men of which we have any knowledge, giving away their dis-

deadly enemy, and will tell you that "bees always would sting them." With this state of things existing, and the idea abroad in the land that honey is a luxury wrung from unwilling and vengewith this state of things existing, and the idea abroad in the land that honey is a luxury wrung from unwilling and vengeful bees, at the risk of being stung to death, we can comprehend why honey is a "luxury," and not a staple article, as it so richly deserves to be. The chief good to be accomplished by the apicultural societies in the land, is to eradicate this unreasonable prepudice, and to establish beculture on a firmer basis, teaching the people that bee culture is not only not fraught with dangers above other employments, but is both pleasant and profitable. Having accomplished this much, all minor obstacles will vanish away, and the products of the apiary will take their place along with other articles of commerce, and will be "staple" in the fullest sense of the world.

Christiansburg, Ky.

T. F. Bingham, of Michigan, took

T. F. Bingham, of Michigan, took exceptions to the subject matter of the address of yesterday, on "Making address of vesterday, on "Making honey a staple product." He thinks when honey shall have become a staple product, and can be secured with the product, and can be seened with the same certainty, and sells at as quota-ble prices as do the ordinary products of the farm, bee-keeping will have lost its attractiveness for most of those who now pursue it. It is the uncertainty of its production, and the many risks now attending its pursuit, that charms its votaries as does horse-

that charms its votaries as does horse-racing with the sportsman or stock-gambling with the speculator.

G. W. Demaree disagreed with the gentleman in his ironical allusion to the subject. In his own county he was overseer of the poor. Every year and every day scores of poor people were supported at the public expense, who could become self-sustaining and who could become self-sustaining and honored members of the community the views suggested by Mr. Cotlinberry were carried into effect, making honey a staple product, and its price a reliable quotation, which would be the result of a continuous summer honey bloom.

Rev. L. Johnson said there were thousands of good and willing men, South as well as North, who had lost a leg or an arm, or were otherwise ina leg or an arm, or were otherwise in-capacitated from earning a comforta-ble livelihood at laborious employ-ment, who would hail with joy the opportunity to support themselves. If bee-keeping was made a reliable oc-cupation, with a certain production and a staple price, as was demon-strated by the author of vesterday's paper (Mr. Coffinberry.) These peopaper (Mr. Coffinberry.) These peo-ple were now more or less dependent; in the North their government pro-vided pensions for them; in the South yidea pensions for them; in the Soluti their hopes fled with their temporary government, and they depended upon the public charity. In the breadth of the land were hundreds of thousands of women, well adapted for bee-keeping, who are now drudging out then lives, often deprived of the merest necessities of life, who but want to be educated in apiculture, and a steady market to support themselves and contribute millions to the wealth and

A. W. Windhorst, of Ferguson, Mo., put in nomination St. Louis, which was seconded. Dr. J. P. H. Brown, of Georgia, in

an eloquent appeal, nominated Cin-

C. F. Muth, of Cincinnati, seconded

the motion, and tendered the use of a hall free from rent.

Dr. N. P. Allen, Kentucky, spoke in support of Gincinnati, and also expenses. tended an invitation to the members of the Convention to attend the Kentucky State Bee-Keepers' Convention, of which he is President, to be held in Lonisville, Oct. 12 and 13. Nominations declared closed, and

Messrs. Poppleton, of Iowa, and Windhorst, of Missouri, were appointed tellers.

An informal ballot being taken, St. Louis received 8 votes, Toronto re-ceived 12 votes, and Cincinnati 18

On the second bullot, Toronto re-

reived 12 votes, and Cincinnati 26.

The time of meeting was left to the decision of the Executive Committee, and to be announced through the beepapers in April next.

An elaborate treatise by C. Dadant,

#### The Influence of Honey on Wintering.

The Influence of Honey on Wintering.

Nobody will question the influence of the food on health. Plants cannot thrive in a soil misuited to them; man, as well as every kind of animal, needs a food easily digested and able to sustain life; bees are not an exception to this rule. Nay, more than man, more than most of the animals, they sometimes eat some kinds of food which, according to circumstances, can sustain their life or cause their death. You have two colonies of bees entirely destitute of honey; you give one of these colonies for food a comb of good and well ripened clover honey; you give the other colony some molasses. Both colonies will seem to thrive equally well, if you make the experiment in summer, when they can enjoy a daily flight. But if you shut up both hives for two days when you release them the bees of the one with clover honey will go out to void their intestines without you being able to see their feces. These will be so small, so light in color, that they will fall unnoticed, as in the every day purifying flight of a healthy colony. On the contrary, the bees of the colony fed with molasses will let large drops of dark and foul matter soil all the neighboring objects.

If, in lieu of the two days' continement

If, in lieu of the two days' confinement

and foul matter soil all the neighboring objects.

If, in lieu of the two days' confinement you prolong it for eight days, then, at the opening of both entrances, the bees of the colony with clover honey will act the same as after their two days' confinement, while the bees of the colony fed with molasses will crawl out, discharging their feces around the entrance; some, if not the greater part of them, will have their abdomens so much distended that they will be unable even to void their contents. These poor bees will crawl everywhere around their hive, and perish on the ground.

I can give another illustration of the influence of honey on bees during a close confinement: For years the importation of Halian queens into this country was attended with much loss; sometimes half of a shipment were alive. Such a result was then considered as a lucky one, for most of the time hardly one queen was received alive, to show that the bees were not all dead when put in the boxes.

Of course, such a business was far from being profitable, and more than one enterprising bee-keeper was deterred from continuing it, after a few trials.

What was the cause of such ill success? The main, if not at times, the only cause, was the quality of the honey given to the bees for food during the journey.

In Italy bees gather largely from a diversity of plants. Persuaded that success in that branch of business was possible, I began, with my shipper, a series of experiments to ascertain which kind of honey was the best for such a long confinement. After several careful experiments during two years, we succeeded so well in the selection of honey that we have many times received boxes containing queens which had barely a dead worker bee, after a journey of 22 days. Then our importing business became a success, and paid back all the money lost in seven years of unsuccessful importation, giving handsome profits besides.

Both these illustrations show what happens during the winter to the bees, accord-

and that this same inalady, if we can eall it a malady, has also made sad havog in in the population of some of our colonies, while some others have passed through the winter safely. I have even noticed that in such a diversity of fate, a few colonies were so tree of diarrhea that I was mable to see a drop of foul matter around their hives.

their hives.

Now let us see what had produced such a difference in the condition of these colonies. The indispensable food for bees is sugar, and chemistry shows that the most easily and most thoroughly digested form of sugar is cane sugar. Honey contains sugar in two different forms—cane and grape sugar. Some plants give honey with more cane, others with more grape sugar, consequently a honey containing the most of cane sugar, such as clover honey, will prove more nourishing than fall honey, which contains more grape sugar, and leave, besides, in the intestines of the bees a smaller quantity of undigested residues. Our bees in winter are confined for weeks, even for months, and it is easy to understand how the colonies with good honey, having less residues in their intestines, were able to remain in good health; while the colonies which had a poor quality of honey to eat, perished more or less readily, according to the onality of this ow let us see what had produced such

times, were able to remain in good health; while the colonies which had a poor quality of honey to eat, perished more or less rapidly, according to the quality of this honey—the bees with juice of fruits or honey—the bees a thread in cells partly filled with pollen, the bees eat some of this pollen and their intestines are readily filled up. The same result follows when the honey is not scaled, for, not only is it watery, but the quantity of water that it contains is increased by the property that it possesses to absorb moisture. This water accumulates in the intestines of the bees, and if they are prevented by eold from voiding it, they become uneasy and perish. Now that we understand this, one of the causes of sickness in bees during winter, let us remember:

1. Not to remove in summer all the spring honey that the bees have stored, leaving in the hives a sufficient reserve for the coldest part of winter.

2. To remove all the combs containing honey stored in cells partly tilled with pollen. These combs are easily found on account of their opacity. They are splendid for bees in the spring, tor this mixture will incite breeding.

lon. These combs are easily found on ac-count of their opacity. They are splendid for bees in the spring, for this mixture will incite breeding.

5. To remove all the unsealed honey that the bees will be unable to consume before winter.

To remove also the honey-dew, when

there is any.

5. To prevent bees going to the elder presses, or to remove the elder stored in the hive. This liquid always remains un-

the five. This figure always remains unscaled.

6. To replace with good scaled honey, or with good thick syrup all the honey taken out, so as to give to the bees sufficient provisions. The best syrup is made with one pound and one half-ounce of water for two pounds of granulated sugar.

Of course, such precautions are not indispensable every winter; for a bad food can keep bees alive if they have frequent tlights. Besides, as it is very difficult to follow my advice to the letter, I have been accustomed to awake my colonies in winter every day when I foresee that the thermometer will reach 45 in the shade. This precaution is especially necessary with chaff hives, for the sun cannot easily warm them inside. The bees, thus awakened, enjoy a good flight, and return with empty bowels, ready for another confinement. bowels, ready for another confinement. Hamilton, III.

O. O. Poppleton thinks as a rule, his bees do as well in winter on buck-wheat or other full honey, as on white cloyer. The main point is to have

well ripened honey.

D. A. Jones prefers the basswood honey for wintering.

Dr. N. P. Allen prefers white clover, or well ripened fall honey.

The Secretary read a paper from Dr. W. R. Howard, of McKinney, Texas, on "Wintering Bees in Texas." [This may be found on page 299.—ED.] G. W. Demaree, Kentucky, thinks the practice of crowding bees hive as detrimental to successful wintering; if it crowds his bees to put them on six frames, he will give them

eight—putting the unoccupied comb at the sides.

C. F. Muth has wintered colonies as well on twenty frames as on ten. Last winter two colonies were left twenty frames, and they came through all right. He thinks the great loss during winter is caused by insufficient

ventilation.

Mrs. L. Harrison, of Illinois, in-Mrs. L. Harrison, of Illinois, in-quired if it was necessary to place an empty comb in the center of the brood chamber for wintering?

eral in the negative.

The Secretary read a communica-tion from Dr. C. C. Miller, Marengo, Ill., President of the Northwestern Bee-keepers' Society, on

#### Swarms vs. Comb Honey.

The principal value of a paper at a convention is the discussion which I carnestly desire light, rather than one upon which I fancy I can give information. My sole business is in raising honey to sell, and the market obliges me to work mainly for comb honey. As every swarm that comes out means just so much less honey in boxes, any hint that will help me to prevent swarming will be of value. Of course I will be told, "give the bees plenty of room;" but sometimes they will swarm in spite of abundant room, and may there not be some little trick that some of you have discovered in the manner or time of giving the room, that may make some difvention is the discussion in spite of abundant room, and may there not be some little trick that some of you have discovered in the manner or time of giving the room, that may make some difference? I think I have gained something by getting the hees started early on as many sections as 1 think they will likely finish, for it has rather seemed to me that bees were not so likely to swarm, if by any means their whole energy could be directed toward the storing of honey. The advocates of side-storing, will claim that bees will commence quicker on sections, if the sections be at the side of combs on which they are already at work, and for some years 1 have tried to secure the advantages of side-storing without its objections, by simply placing in the super, between the sections, a frame taken from the brood elambers, of either brood or honey, and 1 don't know which is best. This frame is moved from one part of the super to another every 3 or 4 days, and whenever it is placed there, the bees are sure to commence work on the sections. How much room should there be in the brood elamber? Mr. Doolittle thinks 7 Langstroth frames; Adam Grimm used 8. This season I have used from 7 to 10, and I confess I have come to no very definite conclusion, but I doubt if I shall ever use as high as 10 again. I rather incline to the opinion that, as a rule, I shall have 8 frames in a hive, putting one of them in the super; will leave 7 in the brood chamber filled with clover honey. But will not the bees be made more likely to swarm if they have only 7 brood frames? Who can tell us the most profitable number of Langstroth frames to be left entirely to the use of the queen? And if she has less room than her utmost ability to occupy, will it invariably promote swarming?

But when swarms do come, what shall be done that the storing in boxes may be

But when swarms do come, what shall be done that the storing in boxes may be the least interfered with? The plan given by J. J. Taylor, in September "Gleanings" appears good, but I like to place my inves in regular numerical order, and dislike very much to change their location. The main features of his plan, is to hive the colony in a box or empty hive, keep them cool and dark till after samset, then shake down the bees from the old hive, and place the new colony in front of a hive in a new location, and let them run in, giving them the frames from the old hive after cutting out all queen cells. Now if this plan will let bees work with the vigor of new colonies, I suppose the inconvenience of changing location should not be considered.

Mr. Doolitle's plan is to cage the queen at swarming and put her in the hive, 5 days after swarming, cut out queen cells, and 5 days later cut out queen cells again and liberate the queen. I have lost a good many queens trying to improve upon this plan, but have failed to better it, unless it be that I generally give the queen for 10 days to some nucleus or queenless colony, instead of keeping her caged.

Will the bees work with more or less vigor on account of the presence of the caged queen? ing?
But when swarms do come, what shall

Will the bees work with more or lessyigor on account of the presence of the caged queen?

I hope we may have the benefit of the experience of others in combating swarms for often it happens that in a discussion, a single sentence may throw more light on a subject than many pages of a long-winded essay.

Marengo, 111.

The question was answered by sev- of aniculture in North America, that to his labors more than those of any other, could the North American Bee-Keepers' Society attribute its success, and that he had done more than any man living to create a market for honey, and to make it a market for honey, and to make it a marketable commodity. He moved that when the committee returned they and their guest be received by the Convention standing.

Dr. Allen, of Kentucky, moved to amend by adding that a recess of ten minutes be also taken to allow members an opportunity to greet Mr. Newman.

Newman.
Which motions were carried unanimously, admidst much enthusiasm.

The reception committee here made their entrance, escorting Mr. Newman who was received by the Convenstanding, when a recess of ten

minutes was taken. On being called to order, Dr. E. Drane, of Eminence, Ky., addressed the Convention on

#### How to Make Bee-Keeping Pay.

Some 5 or 6 years since I determined to make bee-keeping pay if possible. I had a tondness for bees and especially for honey. I had never read any work on apiculture, but concluded that there must apiculture, but concluded that there must be some standard works treating of bee-keeping; began to inquire for such, and learned that there was a paper published at Chicago, ealled the American Bee-Journal.. I immediately wrote a postal card to the editor and received a specimen-copy in which the standard works on api-culture were advertised; also several other papers devoted to bees and the pro-duction of honey and the sale of bee-keeper's supplies.

keeper's supplies.

I knew I had struck a bonanza for when a man is determined to obtain knowledge upon any subject, just give him access to the standard writings on that subject and he can soon know all that is known or unknown about the business. I subscribed for the BEE JOURNAL." Gleanings in Bee Culture" — procured Laugstroth's work and Cook's Mannal of the Apiary and several other works on bees and honey, read myself full of bee theory—went to see all of my friends or acquaintances who kept bees and who were supposed to understand scientific bee-culture. The idea seemed to prevail with them that everything depended upon having the right kind of a hive—they tried every kind—some had moth-traps and hives with frames were numerous, but never a frame could they move, the combs were crooked and crossed. No one offered to lift out a frame and show me the queen, but I was often myited to take a peep through glass as though it were a great treat to see bees under glass, hence I concluded that if my friends had ever understood scientific beeenlure, they had stood still until the wave of progress had gone by and left them 20 years behind. Talk to them about controlling swarming, extracting honey or rearing queens! Oh! that is all a humbug, they would say.

I therefore had to rely on my books and upon any subject, just give him access to the standard writings on that subject and

rearing queens! Oh! that is all a humbug, they would say.

I therefore had to rely on my books and papers—making careful selection of the method that seemed most approved of and practiced by the great bee kings, who annuallymade reports of large yields of honey who had honey to sell by the ton—I studied their ways and endeavored to take lessons of them, I bought an extractor, adopted the Langstroth hive, had comb honey stored in prize sections, packed 12 in a crate and glassed the crate, kept extracted honey in 1 and 2 lb, jars in the stores around, and comb honey in crates, and never offered to undersell the market. I ask and get top prices and have learned and never offered to undersell the market. I ask and get top prices and have learned to keep honey in prime condition (I never ship any in bad order) and I cultivate a home market by trying to keep honey for sale all the year round. Perhaps I night as well say that I have about twice as much extracted honey as comb, and find an increasing demand for it. I recommend all to buy extracted honey.

Ist. Because it is cheaper and is sweet as comb honey.

as comb honey. 2d. Beeause I can obtain larger yields of it than of comb honey and can make more money producing it, and I use it myself all

Marengo, III.

The above paper was followed with considerable desultory debate, which had but little reference to the subject treated upon.

Dr. L. E. Brown, of Kentucky, here announced that a committee of reception had gone to the depot to meet Mr. Thomas G. Newman, editor of the AMERICAN BEE JOURNAL, who was expected on the train then due. Dr. Brown alluded to the eminent services of Mr. Newman to further the cause

once a week, and occasionally at looger intervals. Had I never studied the sub-ject of bee forage I should have been in continual doubt and uncertainty. Let no one flatter himself that he can

Let no one natter numerit that he can learn bee-keeping in a day. Each season imparts new lessons, and it seems as if I were just begining to know the cause of many things about bees and honey, and I do not hesitate to say that I firmly believe do not hesitate to say that I firmly believe that I can make more money out of bees and honey with a capital of one thousand dollars, than average farmers do on five times that amount, taking the seasons as they come. But I wish to persuade no one to embark in the business for I know of no calling that is accessible to so many, and at which so few make money.

T. F. Bingham, Michigan, thought the address worthy of the highest en-comiums, and that Mr. Drane should have the thanks of the Convention for crowding so much practical advice and correct conclusions in such a small and conventions.

President Cook stated that pollen was in many eases injurious to bees in winter, as it had a tendency to unsea-

winter, as it had a tendency to unseasonable breeding, and hence was the cause of much spring dwindling.

Dr. J. P. H. Brown, Georgia, has found pollen very beneficial in the latitude of Georgia, but it might not answer so well in a Northern climate.

C. F. Muth, Ohio, thinks pollen is a great benefit to bees in his latitude, and the always gives them wellen.

and he always gives them pollen combs if he has them, in March.

D. Λ. Jones, Ontario, thought Prof. Cook's ill-snecess with pollen was attributable to other causes. Mr. Jones said he never discriminated against pollen-combs in preparing the bees for

winter.

C. F. Muth said he wanted brood in his hives by March 1, at the latest.
Adjourned till 7:30 p. m.

[Couclided next week.]

The Northwestern Bee-Keepers' Association will meet in Chicago, on Tuesday and Wednesday, October 25 and 26. All hee-keepers are cordially invited to altend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. Miller, M. D., Pres. C. C. Coffinberry, Sec.

WW Owing to the fact that the time the regular meeting of the Union Bee Association, at Shelbyville, Ky., conflicts with the time fixed by the excountries with the fine fixed by the ex-centive committee, to hold the Na-tional at Lexington, the meeting of the Union, at Shelbyville, has been postponed till the 20th of October. G. W. DEMAREE, Scc. Christiansburg, Ky., Sept. 3, 1881.

The Rock River Valley Bee-Keepers' Convention, will be held at Monroe Center, on the third Tuesday in October. We hope a good atten-dance will be the ontcome, and the bee interest revived.

D. A. CIPPERLY, Sec.

The Western Michigan Bee-Keepers' Association will meet in Berlin, Ottawa, Co., Mich., Thursday, Oct. 27, 1881, in Huntley's Hall, at Oct. 27, 1881, in Huntley's Hall, at 10:30 a. m. All interested, are cordially invited.

WM, M. S. Dodge, Sec. Coopersville, Mich., Aug. 29, 1881.

The Southwestern Wisconsin Bee-Keepers' Association will hold its wis., Nov. 30, 1881.

N. E. France, Scc., Platteville, Wis.

The Michigan State Bee-Keepers' Association, will convene at Bat-tle Creek, on Thursday, Dec. 8, 1881. We have reason to expect one of the largest and most interesting meetings largest and most interesting meetings we have ever held. Let all arrange to be present. All District Associations should send delegates. Each person should come with their best experience in their hands, ready to hand it over to the others of the fraternity. It is hoped that all will bring the fullest report possible from their region. Commutation rates are expected on railroads. A. J. COOK, Pres. T. F. BINGHAM, Sec. railroads. A. J. T. F. Bingham, Sec.

# Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 ets. each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the old as well as the new address.

© Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Deserving Articles are Always Apprecinted.—The exceptional cleanliness of Parker's Hair Balsam makes it popular. Gray hairs are impossible with its occasional use. 40w4t

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a son. Any one intending to see up club can have sample copies sent to the persons they desire to interview,

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the Journal for a year free. It will pay to devote a few hours to the Bee Journal.

It is the lleight of Folly to wait until you are in bed with disease you may not get over for months, when you can be cured during the early symptoms by Parker's Ginger Tonic. We have known the sickest families made the healthiest by a timely use of this pure medicine.—Observer. 40w4t

It would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—Also, if you live near one postoffice and get your mair at another, be sure to give the address we have on our list. It would save us much trouble.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums:

We have a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied *free*, in any quantity they may be able to judiciously use.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, Monday, 10 a. m., Oct. 10, 1881.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO.

HONEY-The market is lively and prices steady. We quote light comb honey, in single comb boxes, 18620c; in larger boxes 2c, less. Extracted

œ90. BEESWAX - Prime quality, 18@220. Ал., 11. NEWMAN, 972 W. Madison St.

#### CLEVELAND.

HONEY-There is a slight improvement in our market for comb honey. One pound unglassed sections find ready sale at 21c, for white, and 20c, tor 2 lb, sections. Extracted honey continues at dull 10x42C, BEESWAX. 20x022c, A. C. KENDEL, 115 Ontario Street.

#### NEW YORK.

HONEY.—The advices give a middling fair crop of honey. Moderate lots have arrived, but the de-mand so far hus been very slow, and but little im-provement can be expected until we have cooler weather.

weather.

We quote as follows: White comb, in small boxes, 186(20e; dark, m small boxes, 156(1c. Exracted, white, 166(1e.; dark, 766)c.

BEESWAX.—Prime quality, 21466(23c. THORN & Co., 11 and 13 Devoe avenue.

#### CINCINNATI.

HONEY—Is in good demand here now. I quote: Good comb honey, in sections, is worth 186220c, on arrival. Extracted, 7689c on arrival. BEESWAX.—186622c, on arrival. I have paid 25c, per lb. for choice lots. C. F. MUTH.

#### BOSTON.

HONEY.—1-pound combs are a desirable pack-age in our market, and a large quantity could be sold at 2002.c., according to quality. BEESWAX—P-line quality, 25c. (ROCKER & BLAKE, 57 Chatham Street.

#### BALTIMORE.

HONEY .- But little on the market, and prices

are not quoted.

BEESWAX.—Southern, pure, 216,23c.; Western, pure, 216, 22c.; grense wax, 11c.—Baltimure Market Journal.

TAILLAN A POLIS.

#### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb. sections, 20@25e.— Indianapolis Stock Review.

#### SAN FRANCISCO.

HONEY.—Sules of choice comb, to arrive, have been effected at 20c. for small lots. It is doubtful an order for a large lot of choice comb could be billed in this market. Choice extracted, in barrels, is quotable at 99245c. We quote white comb, 16@20c.; dark to good, 10@14c. Extracted, choice to extra white, 9@10\(^1\)gc.; dark and candied, 8c. BEESWAX—23@25c. STEAKNS & SMITH, 423 Front Street.

#### ST. LOUIS.

HONEY.—In fair request, Strained, Sc.; extracted, Sc.; comb, 16@18c.—latter for bright.
BEESWAX—Prime yellow sells at 18w29c.
R. C. GREER & Co., 117 N. Main Street.

#### PHILADELPINA.

HONEY .- The sapply and demand are alike nominal.
BEESWAX — Best light 23@25c.—Philadelphia Merchants' Guide.

#### Local Convention Directory.

Time and Place of Meeting.

# The Bee-Keeper's Guide;

# MANUAL OF THE APLARY.

By A. J. COOK,

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months - a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and perproduced with great care, patient study and per-sistent research. It comprises a tuil delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings— the products of the Honey Bee; the races of bees full descriptions of honey-producing plants, trees, shrubs, etc., splendally illustrated—and last, though

not least, detailed instructions for the various manipulations necessary in the apiary. This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of eal value. -L'Apiculture, Paris.

I think Cook's Manual is the best of our American works.-Lewis T. Colby.

It appears to have cut the ground from under lature book-makers.—British Bee Journal.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiny.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOOP.

This book is just what everyone interested ibees ought to have, and which, no one who obtain it, will ever regret having purchased.—Mich. Far.

it, will ever regret having purchased.—Mich. Far. Is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without.—Nébraska Farmer.

To all who wish to engage in bee culture, a manual is a necessity. Prof. Cook's Manual is an exbaustive work.—Herald, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every partucular. The richest reward awaits its author.—A. E. WENZEL.

My success has been so great as to almost astonish myself, and much of it is due to the clear, distincterested information contained in Cook's Manual.—WM. VAN ANTWERF, M. D.

It is the latest book on the bee, and treats of both

unl—WM. VAN ANTWERF, M. D.
It is the latest book on the bee, and treats of both
the bee and hives, with their implements. It is of
value to all bee-raisers.—Ky. Live Stock Record.
It is a credit to the author as well the publisher.
I have never yet met with a work, either French
or foreign, which I like so much.—L/ABBE DU
BOIS, editor of the Balletin D' Aproilteur, France.

It is a credit to the author as well the publisher. I have never yet met with a work, either French or toreign, which I like so much—LABRE Dr. Rois, editor of the Bulker Dr. Aprouleur, Framee. It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management, also a butanical description of honey producing plants, and an extended account of the enemies of bees.—Democrat, Pulaski, N. N.

We have perused with great pleasure this rade mecan of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, than the sudual Agricultured it energilly and practice as advised.—Agricultured it energilly and practice as advised.—Agricultured it energilly and practice as advised.—Agricultured, quebec.

This hook is pronounced by the press and leading bee-men to be the most complete and practical treatise on besceniture in Emope or America; a scientific west of the most complete and practical treatise on besceniture in Emope or America; a scientific west of the most complete and some printed, neatly bound, and is a credit to the West.—Pleatern Agriculturis.

This work is undoubtedly the most complete manual for the unstruction of bee-keepers which has were been published. It gives a tull explantion regarding the cure and management of the aphary. There is no subject relating to the culture of bees left untouched, and in the complation of the work Prof. Cook has had the advantage of all the previous knowled of an piarists, which he uses admirably to promote and make popular this most interesting of alloccupations.—American Inventor

It may safely be pronounced the most complete and comprehensive of the several manuals which have recently appeared on the subject of bees and their handling in apiaries. The studies of the structure of the bee, the different varieties, the various bee produced, and in the complation of management, extendim to the smal

The Chicago District Convention will be held at the office of the BEE JOURNAL, on Oct. 25, 26, and a cordial invitation is extended to all bee-keepers who can, to attend. Arrangements for hotel accommodation and table board will be made known at this office. Let there be a general rally.

😰 The Rev. L. L. Langstroth was unable to attend the National Convention, his health being too poor to allow of his leaving home. Learning of his needs, several of his friends started a donation fund for him, and many of the queen bees and implements were donated, to be sold and the proceeds to be added to the fund. Any one wanting a pure Imported Cyprian queen of the Jones importation, or one of "Davis' Patent Honey Carriage Revolving Comb Holder, Tool Box and Recording Desk, Combined," can obtain them and at the same time do a kind and generous act to our friend Langstroth. Apply at this office for the queen or Honey Carriage, and any one desiring to do so, can send any amount to be added to the sum already collected.

Badges, -Bee-keepers going to fairs should wear a badge with a gold bee on it. It will serve to introduce him to other lice men. We will send them for 10 cents, post paid.

Kendall's Spavin Cure is highly recommended by Prof. Williams, the wonderful horse tamer. 41.

Entered at Chicago post office as second class matter.

We give up much of the space in this number of the BEE JOURNAL to the the Report of the National Convention.

The Value of the Honey Crop of America.—In the BEE JOURNAL for last week an error occurred in the figures representing the value of the honey crop. The last two ciphers should have been pointed off to represent cents, leaving the value at fifteen millions of dollars. To save misapprehension, we subjoin the paragraph corrected, as follows:

There are in America about 3,000,000 colonies of bees, but our reports are from less than a quarter of a million, or one-twelfth of the whole. If the one-twelfth that are reported are a fair average of the whole, then the crop of American honey for 1881 amounts to 120,000,000 of pounds. If we call it only a hundred millions, it is worth \$15,000,000.00. Surely the industry is of sufficient magnitude to satisfy the most enthusiastic of its devotees.

The Chicago District Convention will be held at the office of the BEE JOURNAL, on Oct. 25, 26, and a cordial invitation is extended to all bee-keepers who can, to attend. Arrangements for hotel accommodation and table board will be made known at this office. Let there be a general rally.

#### The Langstroth Donation Fund.

A meeting was called at Lexington, Ky., after one of the sessions of the National Convention, to take some definite action relative to the recent illness of the Rev. L. L. Langstroth.

Mr. D. A. Jones said that as Mr. L. had been defranded out of the results of his labors, he proposed that he be presented with a testimonial, as a slight appreciation of his genius as an inventor, and his eminent ability as a

inventor, and his eminent ability as a writer and scholar. He would inaugurate the movement by offering two Cyprian queens to be sold, and the proceeds to be paid to the donation fund for Mr. Langstroth.

Thomas G. Newman was chosen to negotiate the sale of articles contributed. On accepting the appointment, he announced he would contribute \$10, which was followed by a contribution of \$10 each from Prof. Cook, Dr. Parmly, C. F. Muth and Dr. J. P. ted. On accepting the appointment, he announced he would contribute \$10, which was followed by a contribution of \$10 each from Prof. Cook, Dr. Parmly, C. F. Muth and Dr. J. P. H. Brown

H. Brown.

Judge Andrews purchased one of the queens contributed, for \$13, remarking he had no use for the queen. Mr. Newman purchased the second for \$10.

T. F. Bingham contributed 6 of his

smokers, which were sold to Messrs.
J. C. Peden, J. T. Connley, W. II.
Howlet and C. F. Muth.
C. H. Dean contributed a chaff hive,

C. H. Dean contributed a chair inve, which was sold to Rev. L. Johnson.
T. F. Bingham contributed a Bingham & Hetherington uncapping knife; sold to Dr. A. B. Barker.
J. M. Davis contributed his honey carriage on exhibition. This is still for sale by Mr. Newman.
Prof. Cook contributed 6 copies of the Manual of the Aujary which were

rrof. Cook contributed 6 copies of the Manual of the Apiary, which were sold to A. W. Windhorst, Nelson Per-kins, J. W. Northeutt, G. M. Free-man, and 2 to Wm. Williamson. Wm. Williamson contributed a queen; sold to J. W. Northeutt.

queen; sold to J. W. Northeutt.
T. G. Newman contributed 13 photographs of Rev. Mr. Laugstroth, which were sold at 50 cents to the Rev. L. Johnson, D. A. Jones, Dr. E. Drane, G. W. Demaree, O. O. Poppleton, A. J. Cook, J. R. Williamson, H. C. Hersperger, J. W. Northeutt, Mrs. L. Harrison, Wm. Williamson, J. T. Wilson and J. T. Connley.

Any one wanting a pure Imported Cyprian gueen of the Jones importation, or one of "Davis' Patent Honey Carriage Revolving Comb Holder, Tool Box and Recording Desk, Combined," can obtain them and at the same time do a kind and generous act to our friend Langstroth. Apply at this office for the queen or Honey Carriage, and any one desiring to do so, can send any amount to be added to the sum already collected.

\*\* It will pay to devote a few hours in getting up a club for the Bee Jour-NAL. Read the list of premiums on another page, and take advantage of the fall gatherings to get up clubs.

For the American Bee Journal,

#### A Good Fall Harvest.

O. CLUTE.

After the long drouth of July and August, it seemed probable that there would be little fall bloom, and hence

the heat sease, which came of in great profusion; there are many acres of it. Its delicate pink gives a beautiful color to the borders of the stream. It yields honey well, though not so copiously as white clover. The color is a clear amber, a shade darker than white clover. The comb is a clear white, and when filled with honey there is often a faint blush of pink; the flavor is excellent. Here the weather has been extraordinary. I am writing this the 3d of October, and there has, as yet, been no frost that would kill the honey flowers. Tomatoes in my garden are as green and huxurant as ever plants were. There has been but few cloudy days, and only one cold storm which lasted profusion ; there are many acres of it. Its delicate pink gives a beautiful and only one cold storm which lasted for 2 days, hence the bees have been able to work nearly every day and all day long. The abundance of mand the long-continued line weather and the long-continued betweet much betare making the fall harvest much better than was expected.

Iowa City, Iowa.

For the American Bee Journal,

#### Preparation for Winter.

WM. STOLLEY.

In No. 39 of the American Bee JOURNAL, I find an article headed, Extracting from Surplus combs, etc., (preparing for winter). "This prep-(preparing for winter). "This preparation should be attended to during the last of Sept. or the 1st of Oct."

Considering this advice to be good,

I this morning went to work, begin-ing with a young colony, I found that of the 10 frames fully occupied (12 2x-1215 inches), 8 were partly filled with brood in all stages, and 2 of them contained considerable eggs. I therefore tained considerable eggs. I therefore concluded that it would not do yet, to contract their space much, and took out but one frame solidly filled with honey sealed. The lower part of the hive including 9 frames and comb, weighed 37½ fbs., and the total weight after I had put back bees, brood and honey, was 94½ fbs., besides the one frame taken out which weighed about 6 fbs. 6 lbs.

Now the question with me is: "Is it not better to wait with the final

preparation for winter until nearly all brood is hatched?"

We had a severe hail storm on Sept.

29, doing away with my buckwheat entirely, but my bees work on wild autumn flowers as though they had all they wanted or more. My maxim is (as it always was), slow, but suce, and all my bees (14 colonies) have more or less surplus in their brood chamber, and I will get my surplus when I prepare them for winter.

I only extracted so far but about 50

lbs. ont of middle frames, wherever the bees were crowding out the queen by storing too much honey in the brood chamber.

Grand Rapids, Neb., Oct. 1, 1881.

[Yes; but as a rule, the sooner prepared in the fall, the better.—ED.]

Good Crop of Honey.—The honey crop has been good this fall. My bees average 125 lbs. comb honey per colony this season. Chas. M. Gaylorb. Clyde, Kan., Oct. 7, 1881.

Young Basswood Trees. - Correspon-Young Basswood Trees.—Correspondents often inquire where they can get young basswood trees. They can be obtained from almost any of the large commercial nurseries. American linden (basswood) seedlings are quoted at \$6.00 per 1000. The young seedlings of basswood transplant very gastly and I believe it would always. seedings of basswood transplant very easily, and I believe it would almost grow from cuttings in a deep, cool soil, which the linden prefers. The linden may be propagated by layers. If raised from the seed, should be sown when ripe or kept in damp sand in a cool place till spring. Seed sells at \$1.00 lb.

Council Grove Kan. Sept. 99 1881 Council Grove, Kan., Sept. 29, 1881.

Mr. J. S. Hill's Method of Preparing Mr. J. S. Hill's Method of Preparing Bees for Winter.—As the BEE Journ-NAL gives to its readers the painful intelligence of Mr. Langstroth's fail-ing health and his sorrowful utter-ance, "I am unable to take any inter-est in bee matters," we cannot expect him to give us the much-desired plan practiced by Mr. J. S. Hill, of Mount Healthy O. of preparing his colonies practiced by Mr. J. S. Hill, of Mount Healthy, O., of preparing his colonies of bees for wintering, as he promised. I respectfully request him to give to the JOURNAL readers a clear and prac-tical statement of the preparation he gives his colonies of bees, so as to safely pass through such a cold winter as the last, and oblige many readers of the JOURNAL. L. JAMES. the Journal. L. Atlanta, Ill., Oct. 5, 1881. L. James.

Large (rop of Honey.-You made a mistake in my report; I had 25 and increased to 92 colonies; took 3,107 lbs. extracted and 2,920 lbs. of comb—in all, 6,127 lbs., averaging 241 lbs. One colony with increase (1 swarm) gave 506 lbs. of box and 10 Langstroth frames of

honey, with plenty left for winter.
Burlington, Wis. H. NEWHAUS.

#### TWELFTH CONVENTION

OF THE

## North American Bee Keepers' Society

HELD IN THE

Odd Fellows' Temple, Lexington, Ky., COMMENCING ON

#### WEDNESDAY, OCTOBER 5, 1881.

[Concluded.]

EVENING SESSION.-OCT. 6.

President Cook announced the following as committee on resolutions: C. C. Coffinberry, Illinois; D. A. Jones, Ontario; Dr. J. P. H. Brown, Georgia.

The following report was read from J. King, Vice President for New York:

Owing to the fact that at least % of all the bees in this State perished during our last terrible winter, the aggregate honey erop must necessarily be much less than under ordinary circumstances; yet taking the number of effective colonies alive in April, it is doubtful if their work has ever heen exceeded, if indeed equaled, in any preceding year. With the exception of a few localities, we have reports of large yields all over the State. The % of survivors, by taking advantage of the early and abundant honey flow from the locust groves, and afterward, the white clover and hasswood, have more than retrieved the loss of the % which perished. The surplus honey this year is of the finest quality, and owing to the early and long-continued drouth in other parts of our country, it finds a ready market at remunerative prices. These results have been secured mainly from white clover and basswood. The locust and some other early bloom being used mainly to "breed up" with.

Mr. L. C. Rool, the well known success-Owing to the fact that at least % of all

up" with.
Mr. L. C. Root, the well known success

quality when compared with them, and the supply must be kept up so that it can always be depended on at some price, and this will be done by having a sufficient number engaged in the business, to gather up and save the millions of pounds which still is allowed to go to waste in all parts of our country.

op and save the billions of pounds which still is allowed to go to waste in all parts of our country.

As a rule, success in our business is the result of knowledge obtained by practice and familiarity with the causes leading to the success of others, and failure is the opposite of this. So to "advertise" the failures of those who are born to fail, because born without the capacity for intelligent thought and action, is like expecting to be nourished by feeding on the wind, but to publish the success of intelligent management, giving all the "modus operandi" leading to the same, is to point men onward in the right direction. Failures to be entitled to publication should be the results of the experiments of "wise" apiarists, and only such are of any real good to the cause of bee-culture.

C. F. Mutb. Cincinnati, O., gave the

C. F. Muth, Cincinnati, O., gave the following address on

#### Wintering of Bees.

Wintering of Bees.

After a severe winter like the one of 1880-81, during which perhaps 75 per cent. of all the bees in the Middle States of North America died, it is very natural that the subject of wintering is taken up again from very many sides. Although it has been discussed considerably, I am certain that the matter is not yet understood by many. Several very able articles appeared in our BEE JOUNNAL during the current year, the best of which was that of our old triend, Rev. L. L. Langstroth.

All are convinced that everything that breathes requires fresh air. We know that even plants die without it; and when, at the approach of winter, our bees glue up every crevice in the upper part of the hive, it is not because nature teaches them what is best for their welfare, but coming from a warmer climate, they aim to exclude cold air, and, like all the lower animals, do not profit by past experience.

With an insufficient ventilation of school houses in our large cities, the majority of our children would die of consumption. It is folly, therefore, to suppose that without sufficient ventilation a colony of bees can pass through winter successfully, especially so when the winter is cold and long, when the bees are required to consume more food than usual in order to create the necessary heat to sustain life, and when their exhalations keep, condens.

securited untility from white cover and passwood. The locust and some will and some will and some of the passwood honey, making an average of 100 lbc, of white clover, and 125 lbs, of bases wood honey, making an average in all of 20 lbs, of white clover, and 125 lbs, of bases wood honey, making an average in all of 20 lbs, of honey. The larger part of his crop, we believe, was taken with the extractor. This is the best yield we know of, but Mr. G. M. Doddittle has written us that his report will be better at the close of this season than any he has given for several years. Mr. C. J. deproto, of the base of this season than any he has given for several years. Mr. C. J. deproto, of the base of this season than one of the building No. 14 Park Place. New York City, has not been run for honey, but we believe we could have obtained at least 75 lbs, of the boney is the couls here of the building No. 14 Park Place. New York City, has not been run for honey, but we believe we could have obtained at least 75 lbs, of the bone on the roof of the building No. 14 Park Place. New York City, has not been run for honey, but we believe we could have obtained at least 75 lbs, of the bone on the roof of the building No. 14 Park Place. New York City, has not been run for honey, but we believe we could have obtained at least 75 lbs, of the bone on the roof of the building No. 14 Park Place. New York will be described in the well-are of the partial reports from nearly all parts of the States for this season's work.

We have taken some pains to find out that of the partial reports from nearly all parts of the States for this season's work.

We have taken some pains to find out that of the partial reports from nearly all parts of the States for this season's work.

We have taken one pains to find out that and other States during last winter and spring, and feel constrained to charge the find the partial reports from nearly all parts of the States for this season's work.

We have taken one pains to find out the partial reports from near

Last fall, however, I left only an air-space of one-sixteenth of an inch below the cover, thinking that sufficient, as it was during the two previous mild winters; but the winter was too severe, all of my hives were damp, and those which were dampest lost the most bees. Insufficient ventilation was the cause of my last winter's loss. Two of my colonies prepared as of old, with an air-space of one inch above the straw mat, were my only colonies that came through safely and in good condition. As bees all over the country suffered alike, in single-walled as well as in double-walled and chaff hives, I am more convinced than ever that a proper ventilation is the great secret of safe winventilation is the great secret of safe win-

O. O. Poppleton, Iowa, makes no provision for upward ventilation. He uses frames 12x12 inches square, with

wide top-bars, and there is but little chance for air to get through. T. F. Bingham, Mich., has found a large accumulation of dead bees on the bottom-board each winter. He intends to raise the frames this winter at least two inches from the bottom, so as to have room to scrape out the

dead bees frequently.
C. F. Muth will continue to use a second story in wintering, then bore inch holes in the ends of the upper

of air above the packing.

J. C. Peden, Lawrenceburg, Ky., approved Mr. Muth's suggestions: he gave several interesting illustrations in proof of his views.

A naper was read from W. Thomas. Adelphi, Ohio, entitled

#### Dysentery in Bees, and its Causes.

A paper was read from W. Thomas, Adelphi, Ohio, entitled

Dysontory in Bees, and its Causes.

We have selected the above to plus for a selection of the subject, but for the reason that we hope to awaken thought, and perhaps be able to throw a little light pont this vect question. The subject is critarily one of vital importance to every fully studied and well understood by all.

The great difficulty with nost of its who write on this subject, is to diverse tomestees of precenceived notions and theories, being as a general thing, reliefued to trace in the subject is to diverse tomestees of precenceived notions and theories, being as a general thing, reliefued to trace in the subject is to divest ourselves of operconceived notions and theories, being as a general thing, reliefued to trace in the subject is to diverse to subject to the continuous of the subject is to diverse to subject to the original subject is to divest ourselves of operconceived notions and theories, being as a general thing, reliefued to trace in the subject is to diverse to subject to the continuous of the subject is to diverse to subject to the continuous of the subject is to diverse to subject to the continuous of the subject is to diverse to subject to the continuous of the subject is to diverse to subject to the continuous of the subject is to diverse to subject to the continuous of the subject is to diverse to subject to the subject in the subject is to diverse to subject to the subject in the subject is to diverse to subject to the subject in the subject is to diverse to subject to the subject in the subject is to diverse to subject to the subject in the subject in the subject is to diverse to subject to the subject in the subj

purest honey, when under such circumstances taken greatly in excess, is sure to produce dysentery if the bees are long confined without a fly.

produce dysentery it the bees are long confined without a fly.

And this brings us to consider the effect that cold has in bringing on this disease. We have already said that any undue excitement or disturbing cause has its evil results, and we know of no one cause that is of a more exciting nature to our little pets than that of excessive cold. Bees are inclined at a moderate temperature to pass into a semi-torpid, quiet condition, and as one writer says, "When in this state it is very easy to rouse them from it by gently shaking or tapping the hive. When this is done in winter the bees wake up, so to speak, become excited, and soon, by the rapidity of their respirations, raise the temperature of the hive to a great height." The same writer, speaking of the striking effect of the sudden disturbance of bees, says:

the temperature of the live to a great height." The same writer, speaking of the striking effect of the sudden disturbance of bees, says:

"On the morning of Jan. 2, 1836, at a quarter past 70 clock, when there was a clear, intense frost, and the thermometer in the open air stood a little above 17, and that in the live marked a temperature of 30, that is actually two degrees below the freezing point, the bees were roused by tapping on the live, and in 16 minutes the mercury rose to 70%, or 53° above the external air."

As we have already remarked, bees if left alone quietly in moderately cold weather will pass into a partially torpid, or as one writer says, "sleepy condition," from which, however, by a beautiful provision of nature, they are aroused by excessive cold, when, breathing with great energy, an amount of animal heat is soon produced that speedily raises the temperature of the hive may, in a few minutes, by disturbing the bees, be increased over 50°.

Thus we see that severe cold is the most serious disturbing cause that the apiarist has to contend with, and it does no doubt, at times, produce an undue amount of excitement. This excitement and the desire for food to keep up the requisite amount of animal heat, causes the bees to fill themselves to excess, and thus brings about an abnormal condition, which finally results in dysentery. But the difficulty does not stop here, for if the bees are long exposed to excessive cold, their continued efforts to keep warm and thereby preserve life, will soon destroy their vitality. In reality there is, to our mind, no other cause so destructive to bee life as severe cold. It causes excessive feeding, requires a great waste of vital forces, and in this way the tendency is continually toward disease and death. There is still another too bee by excessive cold. In their efforts to keep up heat, their rapid breathing has a tendency to increase the humidity of the atmosphere in the hive, and this being heated and coming in contact with the cold from without, condensati

dampness, and was now convinced the

hives should stand in winter where they would get all the sunshine.

Rev. L. Johnson, Kentucky, thinks bees can usually be revived after several hours apparent death, except where dysentery has been the cause. Mr. Johnson recited several instances where he had resuscitated bees ap-parently dead from cold and from drowning

. F. Muth corroborated Mr. John-

son's views.

F. Della Torre, Maryland, claimed that dysentery was directly attributable to excessive moisture in the hive one to excessive moisture in the five. Sulphuretted hydrogen is caused by the dampness, and this is a deadly poison; however, this can be overcome by several chemical agents, among which is quick-lime (unslacked lime).

time.)
Miss Marie Nottnogel, Lexington, Ky., a beautiful little girl of 7 years, delivered a short recitation on the honey bee, and was decorated a member of the North American Bee-Keepers' Society by President Cook, in an eloquent little address.

The following valuable paper from V. T. Stewart, Eminence, Ky., was read, entittled

## The Cultivation of Honey Plants.

Good forage of honey producing plants is the foundation or chief corner-stone of profitable bee-keeping. We may be full of knowledge pertaining to science in apiculture, have all the books and journals, the best strains of bees, best hives, with the best surplin arrangements, best extractors and foundation machines, etc., and with all these, if we are located where pasturage is not plentiful, we cannot make bee-keeping profitable. Good and plenty of forage is the mainspring that makes all the other things a success. It is folly to fry, or expect, or even hope to make bee-keeping pay in dollars and cents without a sufficiency of honey plants from which to obtain honey, and yet it is the most neglected thing in the bee business. But few of us have ample pasturage naturally for our bees, and the best of locations can be greatly improved at a trifling cost, and the very worst locations can be made good by a judicions planting for forage. The cost of artificial pasturage is but a trifle when compared with the good resulting from it. A few dollars spent in making pasturage will pay a big percentage ou the investment, if invested intelligently. What to plant, when, where, and how to cultivate to obtain the best possible results is what we want, and it is very essential that we have a knowledge of the nature of the various plants, and also the value of each particular plant as a honey producer. It is just as easy to plant the good, as it is the poor, and takes the same land for either. After considerable experimenting and close observation comparing and ealenlating, I have come to the following conclusions as to what is best to cultivate, and how to cultivate it: By observation, comparisons and calenlating, I conclude that figwort (Simpson honey plant) is the best honey plants, and also the value of each particular plant as a honey in plant is seed, beginning to bloom in June, branching and blooming to each of the call and the plant is seed, beginning to bloom the seed, blooming the first of July, and continues spreadi

about 20 days as figwort. But even then it lasts about 4 times as long as clover, and is fine forage as long as elover, and is fine forage as long as elover, and is fine forage as long as elover, and pis a very excellent honey plant, and is a favorite with bees. It blooms full three months, and produces rich nectar, and that abundantly; is easy grown from seed, blooms the second year, and continues to spread and grow from the old root for years; it seeds itself, and new plants are constantly springing up. The old plants are constantly from new seed, and blooms the second and third years, then dies root and branch, but will re-seed itself anywhere and everywhere in the neighborhood of the old plant. It will thrive on any soil, hard or loose—it has this advantage over any other fine honey plant; and is just about as good along traveled roadsides as anywhere; it is well suited for nooks and corners; it blooms profusely for full three months, and is rich in nectar when it is not too dry and windy. Honey is of good quality, and you cannot afford to do without it, and when once you have it you will never be without it.

Basswood is good, if we have plenty of it naturally; but to undertake to entitivate it alone for honey, would not be wise; while you are waiting about 10 years tor it obloom from seed, you can get rich from the fig and motherwort, judicionsly planted. Basswood yields abundantly while in bloom, but it only lasts 10 or 12 days each season, and falls entirely some seasons. But if you have plenty of forage for the present, it will do well to plant for the future, to have in your old age. None of the above named plants furnish policen to any extent. For pollen the best thing to continue the seed it will

would keep it out of my cuttivated ag and sun of motherwort field.

Bee-men beginning to see the importance of planting for surplus, we can self seed enough each year to defray all expenses of 20 acres of land, and still seed enough will fail on the ground to supply all the vacant spaces; then in 7 or 8 years our basswood and poplar will begin to bloom. Then with all these advantages of forage and proper management of the apiary, we would astonish the world with our surplus honey report. Even G. M. Doolittle would begin to crawl down from his high pinacle of fame, and wonder at our success. We at once see that all this is practical, and that, too, at a triffing cost, when compared with the advantages gained, especially to those who are so fortunate as to live in the country, or own a little land; us who live in fown, and own in the land; us who live in fown, and own in the land; is who live in fown, and own in the land; is who live in fown, and own in the land; is who live in fown, and own in the land; is who live in fown, and own in the land; is who live in fown, and own the even then we can greatly improve our fortunate. We can procure a few seeds of the standard plants growing wild, and transplant them somewhere handy, where we can save all the seed each year, and then every time we take a little jaunt around the neighborhood, we can scatter a few seed in every available spot, and soon it begins to spread from seed falling, and greatly facilitates our chances for surplus honey, without damaging any per-

son. Another thing we ought to do, is to not only plant in range of our own bees, but outside of their range for other people's bees. This keeps their bees off of the forage in that way.

There are many other plants not named above, that we might work to good advantage, such as peppermint along wet, low places. Buckwheat, in some localities, pays well to cultivate. It does no good in this locality very often. Spider plant, cleome and mignonette I have not tested, but suppose from reports it will pay to cultivate them. There is an aster called the hot suppose from reports it will pay to cultivate them. There is an aster called the on lawns, and is a most excellent honey not directly and should be cultivated largely for both. I might picture out many practical plans for beautiful lawns of honey producers, but it would be too tedious for this occasion. In conclusion, let me say that it would be well for us to exchange seeds with those who have something that we have not, and we have what they have not; variety is the spice of life. Now let us ever remember this one thing, that to make momey out of honey, we must have good forage, and if we do not have it naturally, we must make it.

On motion, adjourned till 9 a. in.

On motion, adjourned till 9 a. m.

MORNING SESSION, OCT. 7.

Mrs. Harrison, Ill., offered the following resolution, which was adopted:

Resolved, That the President and
Secretary be empowered to issue lifemembership certificates to all bekeepers they may approve, upon the reception of a fee of \$10 for such membership, without further annual dues.
Dr. J. P. H. Brown, Ga., offered the

Pr. J. P. H. Brown, Ga., offered the following, which was adopted: Resolved, That the Vice Presidents be especially instructed to appoint suitable persons in the prominent towns of their respective States to encourage exhibits of honey, bees, etc., at the local fairs, and to secure the offering of suitable premiums for the same

The following was adopted

Resolved, That a committee be appointed to prepare a pamphlet containing statistics of the honey crop, and general information about exhibits of bees, honey and apicultural implements at fairs and expositions, and advice about the best way of conducting the same; said pamphlets to be supplied to the Vice Presidents and others, and that the committee have power to draw on the Treasurer of this Society for all necessary expenses.

The President appointed the following gentlemen suid committee: T. G. Newman, Rl.; C. F. Muth, Ohio; Dr. J. P. H. Brown, Ga.; D. A. Jones, Ontario, and Dr. L. E. Brown, Ky.

The following paper was read from D. A. Pike, Smithsburg, Md., giving

## The History of the Albino Bee.

The History of the Albino Bee.

Late in the fall of 1873 I reared a queen from a colony of Italian bees, and allowed her to remain with the colony until the spring of 1874, when I noticed that one-half of her worker progeny were very nicely marked Italian bees, the other half being marked in the following manner: About the eyes they approach nearer a purple than the Italians; beginning at the waist they first have three distinct yellow bands, then three distinct white bands; the white is pure, not muddy or dirty; the wings are finer, and of a bright silvery color; their shoulders and the under part of the abdomen is very thickly coaded with white hair; the queens are very prolific. As soon as I noticed them I begal to breed them out, using the greatest care, so as to get them pure if possible. I removed them from my own colonies to a place where they were not likely to come in contact with other bees. I kept them there until they reproduced themselves with all the markings of the pure albino, watching them very closely, and examining them carefully until I no longer found any Italian bees among them, or any bees bearing any other mark than those of the albino. Then I considered that I had them in their purity, and that they would not breed back to the Italian bees.

I have tested them as to their merits, and have placed them in competition with the Italian and Syrian bees, all having

back to the Italian bees.

I have tested them as to their merits, and have placed them in competition with the Italian and Syrian bees, all having about the same pasturage, and find that they gather more honey, are more gentle to bandle, and stick closer to the combs than any other bees. The queens and workers are the handsomest bees I ever saw. I have given them a severe test, in order that I might feel safe in guarantee-

Bee-Keeping as a means of Support.

For ages the honey bee has been the servant of man, yielding the product of its labors for his use and pleasure. Until about the middle of the present century, the home of the bee was the abode of mystery, and whether that home was constructed of straw, clay or wood, around it gathered superstitions thick and strong. The discoveries of Dr. Dzierzon, of Germany, and our own honored Rev. Laugstroth, have solved the mysteries and dispelled superstitions, so that the apiarist of to-day may know with certainty just the condition of his colonies at all times, and generally able to correct all that is wrong.

In 1846, bee keeping in Germany was declared to be of no importance in rural economy. From 1850 to 1855, the staid old Germans began to open their eyes at the announcement that Dr. Dzierzon realized a profit of from 30 to 500 per cent, on the capital invested. And now in our own country from 100 to 500 per cent, on the amount invested is not an uncommon yield. The use of honey and wax extractors, and the manufacture and use of comb foundation, the importation and improvement of the Italian bee are all things of the immediate past.

From the light of the past and present,

fors, and the manufacture and use of comb foundation, the importation and improvement of the Italian bee are all things of the immediate past.

From the light of the past and present, we ask what is the prospect of bee-keeping as a business, or the sole vocation of an individual. The first question to be decided is, "will it pay?" This must be determined by "the man and the location." It is not the province of this essay to speak of the wealthy amateur, or the pleasure or knowledge derived, nor yet of the farmer or mechanic, who keeps a few colonies simply to supply his own table with choice dishes of honey, but as a source of revenue. Neither will I take the liberty to array the names of the honey producers of the United States and Canada, who have made bee-keeping a financial success. But to the young man, about starting in business for himself, we will say that bee-keeping presents brighter prospects of success, than it has in the past. Scientific bee-keeping as a business, is both a profession and a trade. It pays no especial homage to any of the learned professions. The apiarist deals with, and studies the great forces of nature. He sees in a marked degree the importance of the early and the later tain, and the bright warm sunshine at particular times, hence becomes a climatologist; of necessity he takes up the sciences. He studies into the intricacies of animal life. He becomes, in time, a botanist. Philosophy is brought into use in the proper ventilation of his hives, and in the construction of winter repositories. He observes the difference in soils for the yield of nectar from a particular bloom, and the effect of altitude in the quality, as well as quantity of honey secured.

To engage in bee-keeping as a business, it is necessary to understand the nature and wants of the honey bee, and a knowl-

the quality, as well as quantity of honey secured.

To engage in bee-keeping as a business, it is necessary to understand the nature and wants of the honey bee, and a knowledge of their management. This may be obtained in theory, by a study (not merely a reading) of all the standard works extant, and journals devoted to the science of bee culture. Add to this the practical use of the knowledge obtained in some large aplary for a year or two, if possible, and then you will be prepared to look for a location (as the young M. D. would say). "Do not try to build up by crowding out some one already established; there is room enough for all the bee-keepers of the United States for some time to come."

It surplus honey be the object songht, get the very best unoccupied field, if possible, where soft maple, red raspberry, white clover and basswood abound, without special reference to railroad facilities. If the rearing and sale of superior colonies and queens be the object in view, mail and railroad facilities are very important.

Thus armed and equipped as the law di-

man and ramfoad facilities are very important.

Thus armed and equipped as the law directs, a few hundred dollars may be invested in bees, with better prospect of satisfactory returns, than an equal amount in almost any other direction. One hundred dollars invested in an old horse is thought to be a small matter, but \$100 invested in one purchase of bees, would be thought by some to be extravagant. The horse may turn his heels to the sun on five minutes' notice, and his late owner, if very saving, might estimate the value of shoes and hide; but the man who invests \$100 in bees, is expected to become a "bloated bond holder" in 3 or 4 years, or "bees are no good."

cessive rains sometimes blast the hopes of the apiarist. In this locality (N. W. Penn.), in the summer of 1871, during the blooming of white clover in June, the weather was cold, dry and windy. But little honey was secured in the flowers under such circumstances, and the entire summer proved alike honeyless, and in early autumn I reduced my apiary from early autumn I reduced my apiary from 130 to 50 colonies, in order to put them on a safe winter footing. A few were doubled,

cessive rains sometimes blast the hopes of the apiarist. In this locality (N. W. Penn.), in the summer of 1871, during the blooming of white clover in June, the weather was cold, dry and windy. But little honey was secured in the flowers under such circumstances, and the entire summer proved alike honeyless, and in early autumn I reduced my apiary from 130 to 50 colonies, in order to put them on a safe winter footing. A few were doubled, but I killed and buried bushels of bees, saving their combs clean and nice for further use. A similar state of things has occured 3 or 4 times in my experience of 35 years, but let us see how other people are sometimes effected in seasons of frost and drouth. I have known dairymen to sell good cows at \$5.00 each, on account of the prospective scarcity of hay. It will be readily seen that farmers suffer even heavier losses than the bee-keeper by unfavorable seasons.

Any person possessed of conscientious qualms against the killing of one, or many colonies of bees in autumns or unpropitions honey seasons, had better never engage in bee-keeping as a business. The keeping or killing must be altogether a matter of dollars and cents. If in 100 colonies in the fall, there be only sufficient stores for the safe wintering of 50, it is a question which will pay better, reduce the number to 50, or purchase food for 100. It will depend much on circumstances, and the market value of the colonies in the spring. My own experience leads me to the belief that in a large majority of cases, it pays best to reduce the number of colonies, the hives and niee clean combs being being worth in the spring, nearly as much in the hands of the skilled apiarist, as colonies will sell for. The heavy losses sustained last winter are discouraging, it is true. It is also true that such losses are more speedily regained than with any other stock. While absolute safety in the possession of property is not the inheritance of man, the bee-keeper may feel quite as secure as those engaged in any other industrial purs

T. G. Newman being called for, addressed the Convention as follows, on the

#### Stepping-Stones toward Perfection.

This subject is one of immense magni-

This subject is one of immense magnitude, and I must content myself with the merest outline of thought, allowing those present to fill out the figure, and dress it up to suit their fancy.

Scientific apiculture in its fullness and perfection stands out to view as a great mountain, whose sides apparently forbade the approach of man, but whose top presented tantalizing to view the beauty of perfection, the sublimity of the complete control of the honey bee, and the full development of scientific management of the apiary—a "land flowing with milk and honey," turnishing God given sweetness to all the nations of the world as a staple product, with a commercial value like butter, cheese, and sugar.

How to ascend this mountain and plant our feet upon its glorious summit is the all-important question. Talk not to me of impossibilities—my faith in the ultimate triumph of scientific apiculture is progressive; it

"Laughs at impossibilities, And cries—H shall be done."

"Laughs at impossibilities, And cries-It shall be done."

When Frederick Winslow proposed, less than 100 years ago to light London with gas, James Watt, Walter Scott and other great men laughed at the idea, but see today the wonderful illumination of ten thousand times ten thousand cities with

When Fulton proposed to run a steam boat up the Hudson River, men scoffed at the idea, but the millions of steam boat palaces and drawing-room cars drawn by ponderous engines over land and ocean, demonstrates grand accomplishments for steam

The electric light, so much ridiculed for

steam.

The electric light, so much ridiculed for years, now rivals the sun, and pales the very moon and stars with its brilliance!

In the misty ages of the past, the grand "mount of transfiguration" we have just caught a glimpse of, was enveloped in clouds and thick darkness; the ancients saw apiculture only in its crude state; "this treasure they had in earthern vessels" in the time of A braham and Samson, Greek and Roman poets and sages caught only a glimpse of the glorious fruition, and then the world went into the depths of mire. Ignorance and superstition reigned supreme, until the days of Huber, Bevan, Dzierzon and Berlepsch, who cleared away much of the rubbish around the base of the mountain—laying bare the rock on which to build the mighty stairway leading to its glorious summit.

Thereon was built the first step by that intellectual giant whose name every true American honors—the Rev. L. L. L. Langstroth. The step consisted in adapting the movable-comb principle to his bee hive,

by indonitable energy and inventive genius.

Step No. 2 consisted in the multiplication of bee books and bee papers, scattering information like antimm leaves, awakening scientific investigation and inviting inventions to aid in the scientific management of the apiary.

Step No. 3 called the bee lovers together in conventions, developing the best thoughts, and the most advanced ideas of those devoted to this industry.

Step No. 4 was the importation of Italian bees, placing the possibilities of improvement within our grasp.

Step No. 5 showed us how to Italianize our apiaries, rear and ship the new bees, and thus spread them all over the continent.

Step No. 6 taught the increase of colo-

and thus spread them all over the continent.

Step No. 6 taught the increase of colonies by division, instead of swarming.

Step No. 7 brought to our astonished view the possibilities of making a staple article of honey, giving us the honey extractor by which to obtain the honey by centrifigal force.

Step No. 8 gave us the means of uncapping the combs before extracting the honey, and saving them for future use by the aid of an uncapping knite.

Step No. 9 reassured our nerves by giving us a bellows-smoker, with which to control the bees during our manipulation of them, without danger of being stung.

Step No. 10 presented to our astonished vision sheets of wax, afterwards corrugated and called "comb foundation," to aid the bees in multiplying their numbers and obtaining large yields of honey, by providing room to receive the sweet nectar in the shortest period of time, as well as to control the production of drones.

Step No. 11 gave us magnificently thin comb foundation, to be used in comb honey, giving it strength to endure transportation, and aid in its production.

Step No. 12, presented us with single comb sections to facilitate the building of straight combs, and add to their beauty, facilitate their division, and increase their market value.

Step No. 13, showed us how to improve

comb sections to facilitate the building of straight combs, and add to their beauty, facilitate their division, and increase their market value.

Step No. 13, showed us how to improve the race of bees by constant selection and experiments, breeding in the traits of character desired, or breeding out the undesirable ones.

Step No. 14 consisted in popularizing the consumption of honey, and creating a demand for it among the masses.

Step No. 15, sought out a foreign outlet for honey, thereby creating a valuable market for all our surplus crops.

Step No. 16, gave us many improvements in marketing jars, cans, kegs, sections, crates, etc., thereby adding to the value of the bee interests.

Step No. 17, developed shows for bees and honey, presented an opportunity for good natured rivalry, and raised the standard of the "ideal."

Step No. 18 consisted in planting for honey bloom, to give a continuous yield of nectar for our bees to gather, from early in the spring till late in the fall.

Step No. 19 showed us how to make honey a staple article—giving market quotations, estimating the crops and regulating the prices for it all over the country. Step No. 20. This consists in the development of practical plans for wintering our bees.

This is the "next progressive step"—the last problem to be solved, but profound thoughts of the wise, and the patient experiments of practical men will speedily accomplish it.

From the place we occupy, we catch, now and them, a glimpse of the glorious

From the place we occupy, we catch, now and then, a glimpse of the glorious fulfillment of all our expectations!

white their a glimbse of the globious fulfillment of all our expectations!

"Oh! the transporting, rapturous scene, That rises to our sight!

Sweet fields arrayed in living green, And rivers of delight!

There generous bloom in all the dules And mountain sides will grow.

There rocks and hills, and brooks and vales With milk and hone, flow."

Is there anything to discourage us in our work? No: all looks encouraging. With steady hands and iron nerves, let us near the top stone in the "grand stairway," completing our work, and giving us the possession of that for which we have so long wrought. And while we place in proper position "the cap stone" of the grand structure, let the wondering and admiring people rejoice with greatest joy!

On motion, a rising vote of thanks was tendered Mr. Newman for his able address.

Dr. J. P. H. Brown, of Augusta, Ga., gave an interesting address on

very able paper. [Owing to the length of this trentise, we must postpone its publication until next week.—Ed.]

of inventions, as follows

#### A Partial Review.

"Honor to whom honor is due!"

It is well in looking back from our ad-

It is well in looking back from our advanced standpoint of apiculture, to observe wherein we have profited, and in what respect the present American system of beekeeping differs from that of the past, and to whom most indebted.

The system I have denominated the American, is the substitution of absolute control, for the "happy-go-lucky" methods previously pursued. The early writings of the lamented M. Quinby, called the "Mysteries of Bee-Keeping," which were among the most conspicuous of the closing era, may be appropriately called its closing chapter; while the writings of the Rev. L. L. Langstroth, and the invention of the movable comb hive, may be justly called the opening chapter in improved bee-culture, and the foundation of the American system.

Do I assume too much in saying that nearly all we have of present value rests on one single corner-stone, hewn and perfected by one master hand, whose surpassing genius, experience and practical application, have shown him the master builder, on whose single invention the vast present and the undreamed future of American

cation, have shown him the master builder, on whose single invention the vast present and the undreamed future of American apiculture rests?

Has not the fact come home to every practical bee-keeper in this honorable body, time and again, that amid the thousand changes and struggles to improve and surpass the first and original, or movable-comb bee hive, not one outlived the legal limit of the original Langstroth patent? To illustrate, allow me here to quote a few sentences from the covers of back-numbers of a leading American bee paper:

While Learnestly try to maintain a broad "char-

while I earnestly try to maintain a broad "charity for nil, and malice toward none," and while I do not wish to take upon myself the responsibility of dictating a course for others, I feel it a duty to discourage with all my might, both by precept and example, everything in the shape of patented bee hives, or patents on anything pertaining to been thives, or patents on anything pertaining to been thives, or patents on anything pertaining to be contained to the other hand, I shall try to encourage every one to do all in his power to advance the common good of all. I do not believe the world sellish and states his part of the part of the common good of all. I do not believe the world sellish and states his part of the 
Permit me here to ask, if the leading bee-keepers of America are opposed to patents? and if so, what method they have devised to encourage invention and render unnecessary the methods devised by Congress? Is it of any value to bee-keepers of to-day, or the hee-keepers of the future, that the memory of the inventor of the movable-comb bee hive, and the honey extractor, and comb foundation, should be revered and perpetuated? Or is there no duty or interest except to get more honey and higher prices, and cheap supplies at cheaper prices?

I assume, in the absence of any other plan of encouragement and protection than

I assume, in the absence of any other plan of encouragement and protection than that devised by our forefathers as a just ribute to worthy invention, that the American people do respect and honor not only the inventors, but the inventions and the legal record of them in the United States Patent Office. One of the publishers of a bee paper stated in his publication, that "any man who did not take legal steps to establish the fact of his invention, should not complain because of the indifference of others." Is it not to the interest of every practical bee-keeper, and to the interest of this the most national exponent of American apiculture, to put itself on record as the gnardian and patron of valuable and original first inventions?

Do American bee-keepers expect too

able and original first inventions?

Do American bee-keepers expect too much of this more than national body, in presuming that it shall carefully weigh not only the causes of success and failure, but that it shall lift up its voice in commendation of every worthy and practical invention, while it speaks in no uncertain tones its disapproval of the substantial copying, without invention or improvement, of the worthy inventions of others?

Does not every practical bee-keeper know that if the public could have been kept from buying worthless imitations of the Langstroth or movable-comb bee hive, that hundreds of thousands of dollars would have been saved to innocent bee-keepers, and that our most noble and worthy L. L. Langstroth would not only have received his well-earned honors, but his just rewards?

President Cook paid a glowing and eloquent tribute to the Rev. L. L. Langstroth, the inventor of the movable frame hive.

Dr. L. E. Brown, Kentucky, moved that the sentiments expressed by Mr. Bingham be indorsed as the views of Convention, which motion was seconded.

Dr. Parmly, D. A. Jones, Pres. Cook, and many others supported the motion, which was carried with great

and many others supported the motion, which was carried with great unanimity.

C. F. Muth, Ohio, read the following letter, which he had just received:

Oxford, O., Oct. 5, 1881.

Dear Friend:—I am very sorry that I could not be with you at the Convention—but I grow worse instead of letter.

better.
In this week's AMERICAN BEE Journal there is a strange mistake about a hive sent from Greece to Mr. R. Colvin. It is a regular Berlepsch hive, and contained a Grecian colony, which died on the passage. Mr. Colvin did not keep bees until some years after my patent issued, and this Berlepsch hive did not reach him until some time after he had imported Italian bees. These facts are enough to show how greatly mistaken Mr. Robinson is in this matter.

J. L. LANGSTROTH.

Mrs. L. Harrison, Peoria, Ill., contributed a paper which was much applauded, entitled

#### Suitable Employment for Women.

Suitable Employment for Women.

Bee-keeping, although a laborous employment, demands no great outlay of strength, at one time. It embraces the performance of many little items, which require skill and gentleness, more than muscle. The hand of woman from nature, habit and education, has acquired an ease of motion, which is agreeable to the sensibilities of bees, and her breath is seldom obnoxious to their olfactories, by reason of tobacco or beer.

Women have demonstrated, that the making of hives and surplus boxes is no objection, as they have purchased them in the flat, nailed and painted them. The hiving of swarms is neither more difficult nor dangerous, than the washing of windows or milking. The right time to extract honey, or to put on, or take off surplus boxes, requires no more tact or skill to determine, than the proper fermentation of bread, or the right temperature of the oven required for baking. She is in her allotted sphere while raising queens and nursing weak colonies, or caring for the honey when off the hive.

The most powerful argument in view of the suitableness of bee-keeping for women is this: That it is something sbe can do at home, and not interfere with her domestic duties. Many women of small means have young children depending upon their exertious for support, and remunerative work to be performed at home, brings very little in the market of to-day. For instance, the making of overalls at 5 cents a pair, and shirts at 50 cts, per doz. She is compelled to accept less pay than men, for the same service performed. We had a friend, chosen as principal of a school on account of her efficiency, but was compelled to accept lower wages than her predecessor, who was a man, and dismissed for his incompetency. But we have never found a dealer unscrupulous enough to offer less for a pound of honey, because it was produced by a woman.

T. G. Newman, Ill., expressed himself as fully in accord with the views

T. G. Newman, Ill., expressed himself as fully in accord with the views so concisely and ably expressed by Mrs. Harrison. The paper was a model in this respect.

C. F. Muth, Cincinnati, Ohio, addressed the Convention as follows on

## Fonl Brood Among Bees.

C. Bertram, of Hanover, Germany, publishes the following essay in regard to diseases of bees, heading his article "Foul Brood or Chilling," and tells how foul brood made its appearance in his apiary in the fall, after the days began to be cold. Remembering Mr. Hilbert's remedy, salicylic acid, he mixed some of it with honey and fed it, when he was surprised to see many of his bees flying out and dying out-

side of their hives. He then went to the druggist to ascertain for what purpose salicylte acid was generally used, when he was told, principally to keep canned fruit. He tasted of the acid, which made him cough violently. Having a heavy cold at the time, it relieved him, however, a made him feel better. Now, Mr. Bertra reasons thus: Salicylic acid destroys fugus or germs of souring in truit and dissolves and loosens slime secretions in our body. He claims it has a beneficial effect on our nervous system, and shows to the body. He claims it has a beneficial effect on our nervous system, and shows to the physician the degree of a cold or over-heating in a patient. He says the disease can be prevented by a finely use of medi-cine. He dusted over his brood combs the raw pulverized salicylic acid—repeated it several times, and his infected colony was cured of toul brood in the fall. His other colonies had taken the disease, and com-menced to carry out dead larvæ, but a good dusting with the acid cured them ail. The

meneed to earry out dead larvae, but a good dusting with the acid cured them all. The following season he made the same observation, broot became chilled and died, but before toul brood had made any headway, he applied the acid and cured the affected colonies. Mr. Bertram's resume is that chilling is the cause of foul brood, and that the application of the proper medicine in time, prevents the contagion.

Mr. Bertram says that May disease makes its appearance in spring, and is apparently caused by over exertion. The muscles of the wings became over taxed and lame, and he gives salicylic acid as a good remedy for it. For the b, nefit of our German-reading friends, I recommend the original lengthy document.

Enthusiasin, so essential to success in every business, appears to be especially the characteristic of the snecessful beckeeper, and to him does the old saying, "no roses without thorus" particularly apply. Sharper than a thoru, or even a bee sting, is the discovery by him of foul brood among his bees.

There is, also, not a more social nor confiding class of men than beckeepers. They will fell you all they know about their pets, and, as a triend remarked, "dlf-ferent from other tanciers, they will tell a little more, if any." Against this enthusiastic "little more we have to gnard occasionally, and exercise our own judgment all the time and in everything.

Perhaps no keener disappointment could occur to a bec-keeper than the discovery of foul brood in his apiary. I mean the contagious disease which is called "foul brood," the origin of which is not known, as yet, to any one of us, further than that it is imported from Europe, where it exists to a large extent, and where a bec-keeper gets it trom another apparently without a cause, who then ascribes it to a something as chilling or starving of brood, when, in fact, the sole again two discases, which is removed as the colony gets stronger, when the old combs, cleaned out by the bees and again used for rearing of brood and storing of honey, remain as good as an

chance of thoroughly testing the matter again this summer.
Several lots of bees sent me last spring from friends in the South, arrived here in bad condition. Some colonies had all the brood smothered in every frame, which looked in capped and uncapped cells, so much like the real foul brood that it came near deceiving me. It had the shape and about the color, but removing the decayed larva with a nin-it nulled out complete. larva with a pin, it pulled out complete. Publica It had a skin around it, unlike the larva space.]

killed by the contagion, in which the skin decays almost at the same time with the body. Satisfied that no trouble would arise, and in order to test the matter more than the body. arise, and in order to test the matter more thoroughly, I tilled a number of second stories of strong colonies with these trames of decaying brood. Friends came to see me, and, walking down between two rows of hives, one remarked: "What stench is that?" "It comes from that hive," said the other, extending his mostrils, and stooping down to one of those hives prepared by me. At my request to see if they could scent another hive of that sort, they succeeded. So strong an emission I had never observed from a hive containing the real foul brood. However, my combs were cleaned a few days afterwards and used again for brood-rearing and honey-storing, with the same safety as any.

and honey-storing, with the same safety as any.

If you observe closely this harmless, perished brood, it will not take you long to tell the difference between it and the real, or malignant foul brood. It think it necess or malignant foul brood. I think it necessary to describe it as thorough as possible, no matter if I do differ with the majority of our brethren or not, who appear to think that they know something about the matter. They may be convinced of their error before they know, and it is my object here to put you on your guard, as "I came through the mill," which gave me not a little labor and expense.

You will remember that I had cured last year a number of hives afflicted with the disease, and my apiary was clear of it in the tall. I was generally prompt in disinfecting every infected and emptied hive before I left it, but one. It was left near a window with the entrance closed, ready to be disinfected at some leisure hour, and forgotten.

a window with the entrainee closed, ready to be disinfected at some leisure hour, and forgotten.

Last spring I was coming past the hive and found a large number of my bees around and in the same. The entrance-block had been removed accidentally, and the scent of the hive had drawn on the bees, which were without any forage at the time. The hive was shut up and the bees inside starved to death, knowing that those which had returned to their hives already had taken home with them the bacteria, causing foul brood, and I was bound to let no more bees escape. It proved as I had expected it would. A few days afterwards, I found in several combs of weak colonies a few larvæ killed by the fungus earried in on the feet of the bees coming from the infected hive. The larvæ had already turned into a brownish mass with unmistakable signs of the disease, but apparently not far enough advanced to have thrown out bacteria or spores. I cut out those infected cells, gave all the combs a good sprinkling of salicylic acid with the atomizer, and no signs of the disease were noticed afterwards. Two full frames of brood from another hive where diseased larvæ were more numerons were burned, which, with a good sprinkling, saved the colony. Three very strong colonies, however, had so many cells with diseased larvæ that I agood sprinkling, saved the colony. Three very strong colonies, however, had so many cells with diseased larvae that I should have been sure to have overlooked some, had I attempted to treat them as I did those weak colonies mentioned above. some, had I attempted to treat them as I did those weak colonies mentioned above. A radical measure was necessary. Consequently, I brushed all the bees from their combs into comb foundation, and fed them with the salicylic acid as described at our last year's meeting in Cincinnati, which has proved successful in every instance, and to which I have no improvement to make to-day. See BEE JOURNAL, page 534, November, 1880. It being unpleasant and without a benefit to the average reader to repeat matters so often. I refer interested parties to the respective pages of the BEE JOURNAL as stated above, or to my little pamphlet, "Practical Hints to Bee-Keepers," containing full particulars in regard to the disease, with other interesting matter, which I will mail to anyone for 10 ets., the expense of publishing and postage.

expense of publishing and postage.

Dr. E. Parmly, N. Y., offered the

following, which was adopted:

Resolved, That the thanks of this
Convention are tendered Mr. D. A.
Jones, of Ontario, for the valuable information he has so freely imparted, and the interest he has awakened in the present and former meetings by giving his experience and views on so large a range of topics.

Rev. L. Johnson paid an eloquent

tribute to the Convention.

J. C. Peden extended an invitation

to the members to visit him at his home in Lawrenceburg, Ky.

Judge Andrews addressed the Convention on fall honey in Texas.

A communication from E. E. Hasty

on "The origin of our present races of bees," was read.

[We are compelled to postpone the publication of this article for want of

Dr. Dillard, of Lexington, Ky., was invited to address the Convention. The Doctor, in response, said he was not now engaged in bee-keeping, but anticipated he would be again, as he did not know how he could get along without them.

The committee on exhibits made the following report:

C. F. Math, Cincinnati, Ohio, shows two line all-metal honey extractors of his own manufacture, which for style and workmanship appear to be very complete.

J. Morris, Springhill, Tenn., shows a honey car-rance, which is so perfect in all its parts that any lack edge of who runs for extracted honey cannot all of to do without it.

Charles H. Lake, Baitimore, Md., shows his Old Reliable double-wall hive, accompanied by an ex-imatory letter.

hee-keeper who runs for extracted homey cannot afford to do without it.
Charles II, Lake, Buithmore, Md., shows his Old Relimble double-wall hite, accompanied by an explicit of the control of the contr

The Ber-Keeper's Instructor, the New Endant, of Seeper's Area on exhibition.

On motion, the report was adopted and the committee discharged.

An article was read from Rev. A. Salisbury, entitled,

#### Cyprian Bees.

Cyprian Bees.

After an experience of one year, I must say I am pleased with the Cyprian bee. The attachment springs from no selfish motive, but from a strong conviction that the merits of the race will warrant the estimate. Their beauty is equal to, and will probably excel that of our most beautiful Italians, and the beauty of the latter is never marred by a blood relationship with the former, but rather augmented.

They are good workers, active and industrious, and I am laboring under the conviction that they carry more honey in their sacks than the Italians. My opinion is based on the admitted fact that they are less in size than the Italians when not gathering honey, but when their saces are filled they compare in size with their rivals.

As a race, the queens are evidently pos-

gathering honey, but when their sacs are filled they compare in size with their rivals. As a race, the queens are evidently possessed of more fecundity than Italian queens. In all great enterprises to be accomplished in a given time, the work is done by the multitude, and not the discouraged few. While white clover continues to bloom so early in some localities, commencing the latter part of May, very few colonies of Italians are up with the times for storing in the boxes at the opening of the harvest, so a loss occurs in getting the first clover honey in boxes, for the want of bees to fill them from bottom to top. Cyprians, with any thing of a chance, will be up with the season, and by the thousands will sip the sweet nectar from the snowy fields, and rushing homeward pell-mell, their nervous muscles instinctively move them up-stairs to unburden the heavy load.

It is true, the pure Cyprians are more nervous and easily irritated than the pure Italians, but are not disposed to provoke an attack, but to resent an insult. Most colonies can be manipulated without trou-ble. They are like all other families of the animal kingdom, they vary in disposition, even as do our own children nursed by the same mother. Yet it is sometimes true, the most irritable member of the family is possessed of more good qualities than all the balance of the household. Little diffi-culty need occur with the skillful apiarist in running for box honey, but more diffi-ently is experienced where all the honey is

minimum for box noney, but more differently is experienced where all the honey is to be extracted.

The bees from a Cyprian mother mated with a pure Italian drone, are large, beautiful, active and quiet, and if bred up to a pure race, I am not positive we might not ehristen them "Apis Americana," But we will refrain until we get the length of the tongue. Whether the mixing of the races will produce like results remains to be determined, but if not, all the drone combs should be congregated in the hives occupied by Italian queens, and the victory is surely gained. I prophesy ten years will not have passed before those now ready to discard the new races will change their opinions, and not hastily exclude all foreign blood.

D. A. Longs, Outario, thinks a pro-

D. A. Jones, Ontario, thinks a profitable business can be transacted by Southern breeders and others, in breeding choice drones and selling to queen breeders, especially by shipping

North.
Dr. J. P. H. Brown inquired of Mr. Jones what experience he had in ship-

ping drones.

M. Jones answered he practiced the method in interchanging drones be-tween his apiaries and bee islands. By the use of his perforated metal en-trance, drones not desired to mate with queens could be restrained in the

Rev. L. Johnson addressed the Convention as follows, on

#### Progressive Bee-Culture Past, Present and Prospective.

Progressive Bee-Culture—Past, Present and Prospective.

Scientific bee-culture may properly be said in this country to be confined to the last 30 years. The first bees in America were imported into Pennsylvania about the year 1627. We also have accounts of brees being brought from England to New York and Virginia about the year 1685. From that time forward they have been dissentimated to every part of the United States and Canada. Until the last 20 years all these were of the German or black variety. Until 1851, they were kept in the log-gum, box-hive, or straw-skep. The hives were generally set in some out-of-the-way place, and but little attention given them, except at swarming or robbing time. The weak ones were often brimstoned in the fall, and the liftle honey they had was about the only surplus the owner obtained. Sometimes a capof 20 or 30 lbs. of white honey taken from the strongest colonies, was considered quite an acquisition. The man who could protect himself in veil and guantlets, envelop himself in smoke, and then approach a hive in early morning, burst off the top, and cut out 30 or 40 lbs. of honey, was considered quite a hee man.

Much superstition was held about bees in those days. When they swarmed, bells and pans, and everything which would make a noise were brought into use to make them settle. When a hive was sold, it must be removed at night, and the money left on the stand, or the former owner would lose his luck. When a member of the family died, some one must whisper the sad event to the bees, or they would all leave. The colony was said to be ruled by a king, whom all obeyed; the drones were females, which laid all the eggs, and the workers were—well, only a stinger. In short, scarcely anything was known about bees, and success was attributed almost entirely to luck.

In the year l851, the Rev. L. L. Langstroth invented the movable comb hive which bears his name. About the same time the honey bee was made, and as truth gradually came to the light, superstition was dissipated, and inste

taining to bee-culture, for the first time, began to assume a respectable place. The able work of Langstroth, and numerous articles from his pen, as well as from Samuel Wagner, Quinby, and many others, soon developed a desire for reading upon this subject, which resulted in establishing the American Bee Journal, and a special department devoted to bee-culture in nearly all the leading agricultural papers in the United States. The number of bee papers has been increased in this country in the last few years, until at present we have 7, one of which is weekly. Also, such able works as the "Manual of the Apiary," by Prof. A. J. Cook, "Quinby's New Bee-Keeping," by L. C. Root, "A. B. C. of Bee-Culture," by A. I. Root, and a host of smaller works by able taining to bee-culture, for the first time, oot, "A. B. C. of Bee-Currait, of an oot, and a host of smaller works by able

authors.

Many other movable comb hives, besides

Root, and a host of smaller works by able authors.

Many other movable comb hives, besides that of Langstroth's, have been invented, each claiming some excellence over others, but the original invention still holds its own, and is adopted by a majority of the leading apiarists of America, and remains substantially as it left the hands of the great inventor 30 years ago. Most other hives are complicated, and have many useless appendages, defeating the very object for which they were invented. They look very attractive, and work nicely at a fair, or on a show table, but with a swarm of bees in them, all their movable and adjustable parts are waxed firmly together, and to loosen them jars them and makes the bees hard to control.

Improvements in receptacles for nice comb honey have been nearly as great as those of the hive. In place of the old box cap, we now have the neat and convenient prize section box with snow-white combs of honey, which may be kept in virgin beauty, and free from waste almost indefinitely. The honey extractor is a long stride in progress, which can scarcely be realized. Its numerous benefits, only those who have used one can estimate. By it, the amount of honey obtained can be more than doubled, and many difficulties in successful bee-keeping obviated, while the delicious sweet, free from wax and all foreign substances, presents to the eye and palate a treat not to be despised.

Comb foundation, among the improvements of the present day, occupies no small place. All the difficulties of crooked combs and excessive drone brood can be obviated, and the thin varieties as starters in section boxes will both increase the amount, and improve the appearance of our surplus.

We now come to the progress in the races of brees. The Italian hee was first

obviated, and the thin varieties as starters in section boxes will both increase the amount, and improve the appearance of our surplus.

We now come to the progress in the races of bres. The Italian bee was first imported and disseminated in the United States by Langstroth and others, about the year 1861. During the last 20 years their superiority over the black or German variety has been so generally acknowledged, that but little need be said. Their beauty, docility and superior working qualities are conceded by all who have tried them, and could we but keep this race pure, certainly nothing more could be desired. Recently, by the labors of D. A. Jones and Frank Benton, the Cyprian and Syrian bees have been brought to our shores. So far, but one point in progress has been made by their introduction, viz: Prolificness. Their docility and easy management over good Italians we have not seen, and their honey gathering qualities the past season have not been better than our other importations. It may be that Cyprian queens, crossed with pure Italian drones, will develop some improvements. Why is this? Have we reached perfection? Or have we made all the discoveries we can? We think not.

1. The great drawback to progressive bee-keeping with us is aussuccessful wintering. A tew years ago we thought the problem was solved; but the severe losses of the past winter have convinced us we are as far from mastering the situation as ever. In the fall of 1880, there were in the United States about 3,127,000 colonies of bees. Of these (through the American Bee Journal), 521,230 colonies have been heard trom; of these there was lost during the past winter, 330,012, or about 63 per cent. Taking this as an estimate of 1-6 of all, would make the entire loss about 1,980,072, which, at the low price of \$5 per colony, amounts to a loss to the hee-keepers of the United States about 3,990,362. Of the different hives in use, box hives lost 88 per cent., while of frame hives the loss was 46 per cent.

wintering Bee in Glamps.

The inevitable reign of Borcas is a stem protection of this control of the state of the part of the

plans have been tried, and in some of them

plans have been tried, and in some of them success was partially attained, but so far, nothing positive has been accomplished. We would urge those interested to keep on trying. All engaged in bee-culture may make progress by diminishing the number of poor drones, and displacing queens of doubtful purity, while queen venders should send out no queens until thoroughly tested.

3. Much progress can also be made by planting and propagating honey-producing trees and plants, so that our honey harvest may both be prolonged and increased. Our extensive forests are fast disappearing, and our little pets must have their forage thus destroyed supplied by something else. All our bee books contain lists of these, and a little time and expense devoted to this work, would return to us in a fair increase of delightful sweets. It certainly is very unwise to attempt to supply any deficiency by feeding glucose or grape sugar. This miserable mixture is the fruitful source of a thonsand evils among us. None will suffer more from its adulterating uses than honey producers, and we do hope that all bee-keepers will unite in the future, to drive such a curse from the land.

4. Much progress can also be made by a general knowledge of bee-culture among the people at large, both male and female.

4. Much progress can also be made by a general knowledge of bee-culture among the people at large, both made and female. To this end, lectures should be given by those capable of public speaking, and an interest would thereby be awakened, resulting in great good. Special instruction should also be given in bee-culture in all our agricultural colleges. A business which results in a clear gain of millions of dollars, and furnishes delicions food and useful medicine to thousands, should not be neglected in these institutions. So far useful medicine to thousands, should not be neglected in these institutions. So far as we know, but one college in the United States does this, viz: the State Agricul-tural College, at Lansing, Mich. We need Prof. Cooks in all of them, and soon a host of young men would go forth, prepared by science and practice, the potency of whose influence would soon be manifest every-

where.
Finally, let us not be satisfied with pres-Finally, let us not be satisfied with present attainments, but realizing that "all that lives, grows," press onward. The vast field before the bee-keeper, as yet, is scarcely discovered. New truths can yet be unfolded, and loftier altitudes reached. America has given to the world the most useful inventions, the finest stock and best model government, so may we hope to produce the most delicious honey, the best race of bees, and stand forth as the reigning queen of the great universal hive.

The reverend gentleman produced quite an extensive collection of late blooming honey plants growing spon-taneously in Kentucky, giving the name of each, and its value for honeyproducing.

The Secretary read the following from C. J. Robinson, Richford, N. Y

#### Wintering Bees in Clamps.

The inevitable reign of Boreas is a stern

imaginary ideas, as a "rule," is totally fallible, especially he who does not proceed logically, in any wise, to arrive at a conclusion. Indeed, every old woman is aware that the condition within a cellar is totally different from that of a "hole" in the earth. Within the clamp the degree of temperature is just right and uniform. is totally different from that of a "note in the earth. Within the claim the degree of temperature is just right and uniform, not varying one degree during winter; besides, the atmosphere is excluded from the bees, so that they repose therein in a semi-torpid state while out of the sea of oxygen—the factor that agitates life to its highest coerdies, when called months. the bees, so that they repose therein in a semi-torpid state while out of the sea of oxygen—the factor that agitates life to its highest energies, when called upon by contingencies, such as piercing cold. At each change of temperature bees rouse up excitedly while conlined by stress of weather, which renders their condition more and more unfavorable, until, if the confinement continues, the crisis and ending. The frequent excitements cause bees to gorge themselves with honey, and, what is worse, they glint with pollen, and then continued confinement proves fatal. Bees do not necessarily consume air to any extent, providing their conditions are such that they may lie dormant.

The secret of success, then, so far as yet known, is keeping bees during winter in a semi-existence—no consumption of oxygen, nor of food; no wear and fear of life's energies; but, similar to burrowing quadrupeds, remain quite dormant through the dire cold season. As a winter repository, I call a cellar the half-way house hetween summer stands and clamps.

All attempts at burrowing above ground, such as packing with straw, chaff, hay-

the dire cold season. As a winter repository, I call a cellar the half-way house hetween summer stands and clamps.

All attempts at burrowing above ground, such as packing with straw, chaf, haydoodles, and the like, is downright fraud. Prof. A. J. Cook attempted to "protect" bees in winter in the way he would progressive, and has abandoned his whim for cheating the elements. It is well known that no degree of cold freezes a large cluster of the bees; but freezing cold confines bees to one spot, not allowing the cluster to move obliquely in either direction, and if the severe cold term continues until all the food within reach of the fixed cluster is consumed, the bees starve, even though there is a large amount of stores in the hive and near at hand. It is well known, too, that very low degrees of cold penetrate through the thickest packing that ean surround a hive, and the longer it will be retained after the atmosphere has changed from cold to warmer. Better for bees to remain on summer stands in their double-walled hives, in a situation where they are exposed to the sun's rays, even though the hive be all "ventilation," with an ample quantity of honey. Such conditions afford an occasional let-up for the bees to move on the combs and get a supply of honey, which could not be done where the immediate changes of atmosphere are not felt by the bees. Those bee-packers seen to possess the single idea: fence out the cold or the bees are liable to freeze. They are not aware that bees never freeze while they can feed; indeed, bees cannot be frozen while in a cluster until they have starved. Some bee-keepers provide winter quarfers for their colonies in buildings, but all such repositories are alike objectionable on the same principles which condemn packing.

Concerning the winter stores for bees, thave learned that pollen is only a substi-

but that many favorable conditions are necessary to secure success. He thinks it a preventive of spring dwindling to leave hives packed till the first of May, or later if the weather is unfavorable.

weather is minayorable.

Mr. Jones thinks a great error is committed, by deferring preparations for winter till too late in the season.

C. H. Deane, Mortonsville, Ky., packed his bees carefully, and-had no difficulty in wintering, but a neighbor left large standing with the recover. left bees standing with the second story on the hive as the season for honey closed, and they came through as safely and in as good condition as his own.

The committee on resolutions, by their chairman, C. C. Collinberry, reported as follows:

1. Resolved, That this Convention feels deeply grateful to Messrs, Wm. and J. M. Williamson, and their ladies, for their great sacrifice of time, com-fort and money to contribute to our pleasure and

fort and money to contribute to our pleasure and success.

2. That we cordially thank our co-laborers in Kentucky, and their ladies, for their liberal attendance and assistance in our deliberations.

3. That Mons E. Bertrand, of Nyon, Switzerland, is tendered our thanks for recognition in his valuable paper, Bulletin IP Apiculture.

4. That our cu-latorer, Herr II. Herbert, Meklenburg, Germany, has our congratulations on his very practical Memorandum Book for the Apiary.

5. That the various exhibits in the honey, bee, queen and implement department of this Convention have been meritorious, and have added to its interest.

tion have been meritarian, interest.

6. That the hotels of Lexington, and the rail-roads of Kentucky, have our thanks for reduced

7. That, recognizing the power of the press, the papers of Kentucky and Uncinnut, and our cherished bee periodicals, are gratefully recognized for their many courtesies.

8. That the harmony of our present session will form pleasant recoflections in the long future.

9. That the officers of this Society for the past year, are entitled to our fullest thanks for their successful labors in contributing to our effectiveness as an organization, and which have culminated in this enjoyable session.

Which resolutions were adopted, and the committee discharged.

By paying \$10 each, D. A. Jones and T. G. Newman became life members.

On motion, the Convention adjourned me die. A. J. Cook, President. Einrick Parmly, Sceretary.

 The Northwestern Bee-Keepers' Association will meet in Chicago, on Association will meet in Chicago, on Tuesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States, and in order to do this, all beekeepers should make an effort to be present. C.C. MILLER, M. D., Pres.

# Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 ets. each, or \$8 per 100.

🐼 Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the old as well as the new address.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Deserving Articles are Always Appreciated,—The exceptional cleanliness of Parker's Hair Balsam makes it popular. Gray hairs are impossible with its occasional use. 40w4t

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper: it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the Journal for a year free. It will pay to devote a few hours to the Bee Journal.

It is the Height of Folly to wait until you are in bed with disease you may not get over for months, when you can be cured during the early symptoms by Parker's Ginger Tonic. We have known the sickest families made the healthiest by a timely use of this pure medicine.—Observer. 40w4t

It would save us much trouble. if all would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—Also, if you live near one postoffice and get your main at another, be sure to give the address we have more list. give the address we have on our list.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums:

For a Club of 2,—a copy of "Bees and Honey,"
" 3,—an Emerson Rinder for 1882,
" 4,—Cook's (Bee) Mamal, paper,
" 5,— clotb.
" 6.—Weekly Bee Journal for 1 year,

 We have a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions etc. Any one who may desire to distribute them to bee-keepers will be supplied *free*, in any quantity they may be able to judiciously use.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, (Monday, 10 a. m., Oct. 17, 1881.

The following are the latest quota-Advertisements intended for the BEE tions for honey and beeswax received up to this hour:

HONEY The market is lively and prices steady. We quote highl comb honey, in single comb oxes, 18@20c; in larger boxes 2c. less. Extracted

BEESWAX Prime quality, 186/22c. AL, H. NEWMAN, 972 W. Madison St.

#### CLEVELAND.

HONEY—There is a slight improvement in our narket for comb honey. One pound inglassed bections find ready sale at 21c, for white, and 20c, or 2.1b, sections. Extracted honey continues dull BEESWAX -20022c, A. C. KENDEL, 115 Ontarlo Street.

#### NEW YORK.

HONEY.—The advices give a middling fair crop of honey. Moderate lots have arrived, but the demand so far has been very slow, and but luttle improvement can be expected until we have cooler weather.

We quote us follows: White comb, in small baxes, 1802 us; dark, in small boxes, 1502 us; dark, in small boxes, 1504 tracted, white, 1064 te.; dark, 7649c.

BEESWAX.—Prime quality, 2456c/25c.
THORN & CO., 11 and 13 Devoe avenue.

#### CINCINNATI.

HONEY-1s in good demand here now, 1 quote: Good comb honey, in section, is worth 186220c, on arrival. EXERCEG, 7690c, on arrival. BEESWAX.—186220c, on arrival. 1 have paid 25c, per 1b, for choice lets. C. F. MUTIL.

#### BOSTON.

HONEY.—1-pound combs are a desirable pack-ge in our market, and a large quantity could be old at 240-220, according to quality. BEESWAX - Prime quality, 250. CROCKER'S BLAKE, M'Chatham Street.

#### BALTIMORE.

HONEY .- But little on the market, and prices HOMEL-Back MAX. To not the pure, 21 w23c.; Western, BEESWAX. -Southern, pure, 21 w23c.; Western, pure, 21 w 22c.; grease wax, 11c. - Baltimore Market

#### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb, sections, 20525c. advanapolis Stock Review.

#### SAN FRANCISCO.

HONEY-A sale of choice extracted in bids, and cases is noted at b<sub>1</sub>C, and other bits in cases are othering at some flarge, indicating a warring of values in buyers' layor. Wholesale buyers emphatically reliase to take hold at extreme prices, nost of them maning se, as a top figure. We quote white comb, 160 20c; dark top of 14c. Extracted, choice to extra white, 96:10c; dark and candical sees. BEESWAX-236-25c. STEARNS & SMITH, 423 Front Street.

#### ST. LOUIS.

HONEY.-In fair request. Strained, Sc.; ex-racted, Sc.; comb. 156; ISc.-latter for bright. BEESWAX - Prime yellow sells int 156; Dis-R. C. Gueer & Co., 117 N. Main Street.

# The Bee-Keeper's Guide;

## MANUAL OF THE APIARY, By A. J. COOK,

Of Lansing, Professor of Eutomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of This is a new entition of Prof. Cook's Minnial of the Apary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale imprecedented in the annuls of bee-culture. This new work has been produced with great care, patient study and per-sistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many coothy made open and illustrated with many costly wood engravings -the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value. -L'Aptculture, Paris,

I think Cook's Manual is the best of our American works.-Lewis T. Colby.

It appears to have cut the ground from under future book-makers.—British Bee Journal.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—J. P. West.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOO!.

This book is just what everyone interested ees ought to have, and which, no one who obtain, will ever regret having purchased.—Mich. Far.

it, will ever regret having purchased.—Mich. Far. is a masterly production, and one that no beckeeper, however limited his means, can afford to do without.—Nebraska Farmer.

To all who wish to engage in bee culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticella, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its anthor.—A. E. WENZEL.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—WM. VAN ANTWERP, M. D.

ual.—WM. VAN ANTWERP, M. D.
It is the latest book on the bee, and treats of both
the bee and hives, with their implements. It is of
value to all bee-raisers.—Ky. Live Stock Record.
It is a credit to the author as well the publisher.
I have never yet met with a work, either French
or Toreian, which I like 'so much.—L'ABBE DU
Bots, editor of the Bulletin D' Apicultrur, France.

It is a credit to the author as well the publisher. I have never yet nuct with a work, either French or Toreim, which I like 'so much.—I.ABBE DU Bots, editor of the Bulletin D' Apicultrur, France. It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—Democrat, Pulaski, N. Y.

We have perused with great pleasure this rade mecun of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—Agriculturist, Quebec.

This book is promounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—Western Agriculturist.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explaination regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the complation of the work Prof. Cook has bad the advantage of all the previous knowlede of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—American Inventor It may safely be pronounced the most complete and comprehensive of the several manuals which have recently appeared on the subject of bees and their handling in apiaries. The studies of the structure of the obey have free early appeared on the subject of bees and their handling in apiaries. The studies of the same the profounce of the work with a degree of common sense, he or she canior management

#### Bees and Honey in Russia.

Congressman S. S. Cox, who has spent the summer in Europe, describes his visit to Russia, in a letter to the New York Express of Sept. 29. He thus describes the land and its inhabitants, and avers that the people are greatly interested in bees and the production of honey. Mr. Cox, in describing a journey from Moscow to the Black Sea, remarks as follows:

The country reminds one of the Pacific overland route, except that here and there are many paddocks piled to-gether in fields for sheep-folds as occasion may demand, but the general cultivation, as far as the eye can ob-serve, is that of our prairies. The litcultivation, as far as the eye can observe, is that of our prairies. The little hillocks, made by moles, I suppose, are not so frequent as those of our prairie dogs, but they remind us of our own domain. The soil, where plowed and where it crops out, is as black as the sheep, and in this it is a great contrast to our alkaline plains. We perceive, as far as the horizon's verge, immense fields of grain and meadows of hay, and these remind us of California and its golden grain grounds of recent date. Black sheep and pied cattle are common. Some of the fields are in flower. What can it be? Buckwheat, and in such a width the fields are in flower. be? Buckwheat, and in Buckwheat, and in such a width of acreage.

The ancient Scythians, the ances-

The ancient Scythians, the ancestors of these Russian Sclavs, were celebrated for two things: I. The quantity of liquor they could throw themselves outside of without detriment, and, second, the cultivation of honey. How do the peasants look? Slovenly; the hair long, like that of the classic Scythian of 2.000 years ago—sunburnt and almost dirty in its hue.

Now and then there is a Tartar face, very much like a Sioux or a Kickapoo. The roads are not bad, but it is summer, and the lumbering carts tumble along easily enough. Is there aught as yet to break the monotony? Yes; after the second day the flowers begin to show signs of the southern sun upon the meadows, and some sorghum fields appear with busy bees; buckwheat still in rich flower, but the neverceasing wheat in green and gold remains to the end to amaze the mind.

Mr. Cox was not very favorably impressed with the country; everything was of the crudest sort. The country is very productive; the golden harvests are magnificent and large, but they are gathered in the most expensive way without the aid of machinery -by slow and tedious labor of men, women and children. He says:

Throughout the 1,500 miles of these levels, we saw but two labor-saving machines, and these were run by steam, and for thrashing. The short sickle and the flail—women to bind, men to reap; men to mow, women to rake, and so on to the end, and but few, after all seen, compared with the immense work which seems to have been done by hand. It was not rainy, been done by hand. It was not rainy, except for a few hours, when we perceived the peasants smoking under their carts and behind the hay-rows. All the long, sunny days this wonderful iteration of the harvest and sign of toil, and yet how little to see of the calloused hand and beaded brow with which rhetoric condescends to decor ate labor.

This reminds us of many scenes presented to our view when we were in Europe in 1879, such as women drawing canal boats in place of horses; women drawing, while men held the plow, and such like barbarianisms. Civilization seems to be 300 years behind that of America, and many of the inhabitants in the rural districts cannot be persuaded that anything exists in the World in advance of that seen around them. Ignorance, superstition and prejudice have full sway. With such competitors, what is to hinder America from supplying Europe for years to come with all kinds of farm produce including honey.

To prohibit the use of glucose by law would be about as proper as to compel hotel keepers to use first-class meat in hash, or cheap boarding-house keepers to debilitate the butter. If persons wish to buy and eat glucose, they have a right to do so; we would throw no obstacle in the way of buying it. But we do object to their buying and eating it for pure honey, or syrup, or anything except what it really is. If buyers inquire for glucose, let them have it; if for honey, sell them honey.

#### European International Congress.

Mons. Ed. Bertrand, editor of the Bulletin D'Apiculteur, in Nyon, Switzerland, has kindly sent us the following Report of the great apicultural Congress of European Bee-Keepers, held at Milan, Italy, on Sept. 15, 16, 17 and 18, 1881.

There were about 250 of the most progressive and scientific apiarists present. Among the foreigners we may mention Dr. F. Kuhl, the representative of the German Congress of Erfurt, and Mons. Ed. Bertrand, editor of the Bullentin D'Apiculteur of Nyon, Swisse, and Secretary of the Society of Swisse Romand d' Apiculteur and Mr. Pometta, breeder of Italian bees, of Guido.

Mr. Bertrand reports the proceedings as follows:

Dr. G. Bianchetti, di Ornavasso, a well-known apiarist, and advocate of progressive bee culture, was elected president; and Sig. And. Tartufeti, of Fabriano, the most extensive bee-keeper in Italy, who has 1,500 colonies of bees with a crop of 25,000 lbs. of honey this season, was elected Vice President. The Secretaries were Count Alfonso Visconti di Saliceto and Pastor Bertini.

were Count Alfonso Visconti di Saliceto and Pastor Bertini.

The first essay was by Dr. Grassi on a new bee disease, observed at Messine, (Sicily), and a new parasite of the bee, illustrated by microscopic views of it.

Mons, Ed. Bertrand addressed the Congress on queen breeding. As Milan is the country of queen breeders, this address caused considerable interest. Mr. Bertrand remarked:

gress on queen breeding. As Milan is the country of queen breeders, this address caused considerable interest. Mr. Bertrand remarked;

"All agree that we must breed the best queens, but it must be admitted that all queens received from Italy and Switzerland are not equally good—many are weak, and are poor layers, and often die during the first year. The journey and change of climate may account for this, in some measure, but breeders are not sufficiently careful in rearing them and do not follow the most approved and progressive methods. Complaints are made in Switzerland, Germany and America. The Americans claim that Italian queens bred in that ecountry are superior to those imported from Italy. The following are some of the most important points to be observed in rearing queens: I. Judicious selection; 2. A sufficiency of young bees; 3. A full colony is necessary to feed the royal larve; yet we know that many queens are reared in nuclei. (The speaker quoted largely from Mr. M. Quinby, German authors, Prof. Sartori, and the new work of Dr. Dubini); 4. the queen should be reared only during honey gathering; 5. the royal larve must be with royal jelly, from the egg. I hope this Congress will fully discuss these points."

Count Borromeo remarked that much of the weakness of the queens exported might, perhaps, be accounted for by the change of diet and climate.

Mons. Bertrand asserted that the daughters of imported queens are better than their mothers.

the method given in "Quinby's New Bee-

the method given in "Quinby's New Bee-Keeping."
Sig. Sartori remarked that such careful breeding should not be expected, tor the low prices now paid for queens.
Mons. Bertrand agreed to this, but suggested that breeders fix the price according to the care bestowed on rearing queens, as they do in America.
The Congress passed the following unanamously:
RESOLVED, That the Italian Association send to Mous. Bertrand, for trial, several queens bred in muclei and several bred in full colonies, Mons. Bertrand to test and report upon them without being informed of their manner of rearing.

SECOND DAY.

#### SECOND DAY.

Upon reassembling, Mons. Bertrand read the following address, in French, by Mr. T. G. Newman, of Chicago, editor of THE AMERICAN BEE JOURNAL, and expresident of the North American Bee-Keepers' Society, on

#### The Best Bees.

Mr. President and Members of the International Congress at Milan, Italy:

Please accept our thanks for the thonor you conferred upon us in making us an honorary member of the Central Society of Apiculture in Italy, and for your very cordial invitation to be pres-

ent on this occasion.

We often think of our visit to your think of our visit to your city in 1879, and while memory holds its sway, we shall never forget the pleasant hours we spent with Count Barbo, Pres. of the Central Society, and also with Count Alfonso Viscontial Solicato, the able solitors of U. Isi and also with Count Allonso y Isconia de Saliceto, the able editor of L'Api-coltore, the organ of that Society, and others of your honorable body, and we exceedingly regret that our duties in connection with the BEE JOURNAL will not permit us to accept your cor-dial invitation to be present at the International Congress, and to participate in your deliberations, which will, without doubt, be deeply interesting to those present, and of vital importance to progressive apiculture the world over.

From every land where bee-culture

is practiced upon scientific principles, comes the important question, "How can the best bees be produced?"

While offering a few suggestions.

and briefly reviewing the subject of producing the best bees, we shall not attempt to detail the minutic of breeding them, but will simply offer a few thoughts upon the general topic, for the contemplation of the noted apiarists of the different countries who may be present at the Congress. In "the bee-keeping of the future," not only will the best methods of man-

agement be adopted, but a superior race of bees will, without a doubt, be developed.

The whole world is indebted to Italy

for the Ligurian race of bees which, it is now admitted by all progressive apiarists, are much superior to the German or black bees. Five points demonstrate their superiority—they are more hardy, prolific, gentle, industrious, and beautiful—the queen must be prolific, to be able to keen the hive full

allow the apiarist to manipulate them with ease and pleasure; they must be strong and hardy, to withstand the rapid changes in climate; and must be of singular beauty, to attract the admiration of the fancier of fine stock.

In the general search for the best

hees, those of many countries have been tried and more or less discarded, viz: the Carniolan, Dalmatian, Smyrnian, Herzegovinian and Egyptian, ln 1866, two eminent Germans, Count Kolowrat and Hern Cori, imported the first Cyprian bees into Europe, and the first Cyprian bees into Europe, and expressed themselves much in their favor. Since then, they have imported several colonies more for their own use, but never placed any upon the market, so that other bee-keepers may obtain them.

But to Italy and America belong the honor of putting forth the greatest exertions to produce the best bees in the world. Did not Mons, J. Fiorini, an Italian, make a journey to the Island of Cypins and to Palestine in search of Cyprian and Syrian bees, to improve the race of Italian bees by search of Cyprian and Syrian bees, to improve the race of Italian bees by crossing, or to improve those races by careful breeding? Mr. D. A. Jones, of Canada, at a cost of thousands of dollars, also journeyed to the Island of Cyprus and to Palestine, for the same object; he secured many colonies of Syrian bees, and established an apiary in Cyprus, in charge of Mr. Benton, a braye and fearless American, who (to his honor be it stated) has journeyed through Arabia, India, Ceylon, and the East Indies, and in the face of danger and difficulties untold, in search of some superior race of bees, or some that may be improved by judicious breeding. True, he has not been as successful as could have been desired. but he has planted in Ceylon some colonies of bees from Italy and Cyprus. and if a "cross" of any value can be obtained between these and Apis dorsata, or Apis flora, he has placed it among the possibilities, in the development of "the ber of the future."

As yet, we think that the better strains of Italian bees are the best—

and that they will be the source from which will be bred the "coming bee."
They possess so many desirable points of superiority, that it will be a difficult matter to supersede them with any of the newer races, about which there is much difference of opinion among careful and observing apiarists. We careful and observing apiarists. We have not sufficiently tested any of them to hazard a positive opinion from per-sonal knowledge.

Regarding the Cyprians (from which

much was expected), we have some very damaging reports. They are said to be very herce in disposition, restless on the combs, easily aroused, and display no superiority to the Italians as honey-gatherers. Some of these objections may be based on prejudice. insutlicient investigation.

or insufficient investigation.

The Syrian bees appear to have met with more favor, though many are unable to find any superior traits. We have one colony of Syrians in the BEE JOURNAL Apiary. The queen is BEE JOURNAL Apiary. The queen is large, well-developed, and quite slow and deliberate in her movements. We and deliberate in her movements. We have reared several very promising daughters from her, and all present the same general characteristics of the mother, and nearly approach duplication. They bear no resemblance to the hybrid Italian—in fact, not so nearly as the pure Italian does. The body is nearly a maroon-color, the segments being very distinctly cut, and a polished dark-mahogany color. The a polished dark-mahogany color. The mother queen is certainly very prolific the daughters are quite young yet, and were reared for the purpose of cross-ing with Italian drones. The workers, were rearest for the purpose of cross-ing with Italian dromes. The workers, have a quick, nervous, hurry-scurry movement, are smaller than Italians, and more ready to repel intrusion. They are very good workers, and we think they become more amiable with frequent gentle handling. Meanwhile, we await developments.

and would respectfully request of this International Congress to endeavor to International Congress to endeavor to enforce among Italian breeders more rigid work in the production of bees to be exported. The grand object being to elevate the race, there should be no backward steps: no deterioration in

excellence should be countenanced; Each member received a diploma, as a no thoughtless or hasty work must be allowed—but the most thorough and rigid treatment should be employed, all looking to the advancement of the art and science of reproduction, and the building m of a step of boos that

the building up of a strain of bees that will give the very best of results. In developing the highest strain of horses, not all their offspring are equal to the best; careful selection of those coming the nearest to the ideal animal must always be chosen from which to breed; and the closest scrutiny is necssary while making that selection. The same is true of cattle, sheep, hogs poultry, and bees, "Sports" and The same is true of carue, son, poultry, and bees, "Sports" and variations" continually occur, producing inferior progeny; but all careful breeders who have an eye to the improvement of the race will reject those that do not come up to the estandard of excellence, by sending "standard of excellence," by sending such animals and poultry to the shambles; so let us carefully select the best queens and drones to breed from, and sacrifice all others.

and sacrince an others.

In this way we may hope to attain that degree of perfection in bees so long hoped for, and our exertions may produce that which will be not only a bleasure to ourselves, but will be honor to the present generation and a blessing to the world at large. These thoughts are fraternally sub-

mitted by your co-laborer and friend,
THOMAS G. NEWMAN.

The President remarked that the Inter-The President remarked that the International Congress was deeply indebted to Mr. Newman for this most learned and interesting address, and he thought he was the interpreter of the wishes of the Congress, to ask Mons. Bertrand to thank Mr. Newman, in its name, most cordially, for this favor. The Congress manimously concurred in the views as expressed by the President.

Dr. F. Beltramini di Casati read a lengthy but very interesting billiography

Dr. F. Beltramini di Casati read a lengthy but very interesting billiography of the honey bee. He began this work some 20 years ago, and it is yet unfinished. Ht is a remarkable and unequalled work. Count Barbo. Count Visconti, and others. agree with me that it should be published.

B.] r. A. Dubini, one of the editors of "L'

Dr. A. Dubini, one of the editors of "L' Apientleur" gave an address on the movable cover for hives, which he much prefers to the close top, as used in Italy; the latter are on the German-Berlapsch? principle and open only on the back.

Mons. Violati Fescari, Dr. Bianchetti and myself agreed with Dr. Dubini, while Count Barbo and others spoke in favor of the German-Italian system. Count Barbo remarked that the model of the Langstroth bive which the honorable President Newman exhibited to us, with a movable cover, was useful in obtaining comb honey, but tight covers are more healery for the bees. The Germans on that account had discarded the movable cover. The health of the bees being of first importance.

cover. The health of the bees being of first importance.

Mons, Bertrand observed that there was foul brood in Germany and Italy as in any other country, and perhaps more; there-fore, tight caps had nothing to do with that disease. He had tried both kinds of caps for several years and much preferred the movable ones, for the ease of manipu-lation lation.

#### THIRD DAY.

THIRD DAY.

Sig. A. Marenzi, an able bee-keeper of Bergamo, addressed the Congress on the danger of using sulphur for preserving the combs from the moth. (See Apicoltore, for April, 1881.) He had observed in several apiaries that sulphurated combs given to bees, had after some time, contained foul-brood, while other combs in the same hive not sulphurated were free from foul-brood. He supposed the danger arose from the combs not being well cleaned and dried by the bees, previous to their being sulphured. He wished to call the attention of the Congress to this matter.

long discussion ensued, and it was

A long discussion ensued, and it was agreed to make observations and report upon the subject.

Dr. Bianchetti detailed the method of making swarms by dividing, and a long discussion ensued.

A committee, appointed by the Congress, reported on the best way to extend becculture among the peasants. Mons. Lanza suggested that the State Normal Schools should teach bee-culture and that the teachers should have some bees to inthe teachers should have some bees to in-culcate their lessons. The report was

On the fourth day at the banquet, many humorous speeches were made; it was a very enjoyable occasion.

The National Exhibition was magnificent—the bee section being well filled principally with honey, in various forms. I never saw or tasted such delicious honey before. It was both comb and extracted, light and dark, from all parts of Italy.

Count Barbo, Count Visconti, Dr. Dubini, Prof. Sartrori, and others did everything possible to entertain the visitors—and all sent their best regards to the Editor of the AMERICAN BEE JOURNAL, and wished he were with them to enjoy the occasion.

We are glad to see that the Congress met the question of "breeding for the best" fairly and impartially. We have long known and urged through the BEE JOURNAL that, as a rule, not enough attention was paid by the Italian exporter in the breeding and selection of queens for export; indeed, many of them have been worse than worthless. Sig. Sartori undoubtedly gave the true explanation when he remarked that " such careful breeding should not be expected for the low price now paid for queens." With the low price for export queens in Italy, combined with our pernicious dollarqueen system here, it is not a matter for wonder that many fail to recognize the superiority of the Italian bees; and this, too, has made it possible for our scientific breeders to develop better strains of Italian bees than they have in Italy. The five main points enumerated by Mr. Ed. Bertrand regarding queen-rearing are well chosen.

Bee Eater. - I send you a "bee eater" of some sort, together with his prey. I have often seen them in my apiary. but could never, until to-day, prove them guilty of the murder of my pets. Please give me name and general characteristics. Rose P. Thrall. San Marcos, Tex., Sept. 22, 1881.

[The strange looking insect sent by Rose P. Thrall is the Praying Mantis (Mantis Carolina), and receives the name Praying Mantis from its devotional attitude, as it seems to be on its knees. It is a Southern insect, though I have received it from Indiana, with the same report as to its preying upon bees. It belongs, with the crickets and grasshoppers, to the order Orthroptera, and is closely allied to the walking-stick of our northern States, the spectrum femoratum, which, in a general way, it strongly resembles. Unlike the most of the locust order, it is strongly predaceous, and is even cannibalistic as it will eat its own kind. It has been reported to eat grasshoppers, and it has been recommended to introduce it in localities to which it is not a native, as an abettor in the work of insect destruction. Unless it is a serious pest, as a "bee eater," which I think is probably not true, our southern friends better overlook its minor faults, and cherish it as a friend. Although this queer looking insect looks like our walking-sticks, it has wings, though the female is not able to fly. Its eggs are glued together in a flat oval mass, and attached to some leaf or twig. The Praying Mantis is entirely safe, and may be fearlessly handled. The attitudes which it strikes as it is handled are altogether odd and comical. I wish the lady would send me several more of them, and any other Texan insect will be very thankfully received.—A. J.

For the American Bee Journal. Improvement of the Race of Bees.

DR. I. P. WILSON.

Since receiving the \$10 prize offered by Rev. E. L. Briggs, of Wilton, lowa, for the best Italian queen, I have re ceived several letters of inquiry with reference to my strain of bees, where they came from, etc., and with your permission, Mr. Editor, I will answer those inquiries through the Ameri-

CAN BEE JOURNAL.

I purchased my first Italian queen about 8 years 2go of Rev. A. Salis-bury, of Camargo, Ill., but lost her from want of a proper knowledge of introducing her. I then sent to Mr. Oatman, and procurred from him a very nice queen, also received through you a "perfect beauty" from Aaron Benedict, of Bennington. Ohio, and Benedict, of Bennington. Onto, and also through you an imported queen from Charles Dadant & Son, of Hamilton, Ill. I have purchased quite a number of queens from other breeders, but all being the leather-colored Italians, and not uniformly marked, I disposed of them in one way and another, and set about breeding from the Outman. Benedict and the Datanan. the Oatman, Benedict and the Dadant queens. The first year I raised all my queens from the Oatman stock. but found that this queen did not also the oatman stock. ways duplicate herself, in fact, her queen progeny was far from being satisfactory: her drones were also dark. I raised all the drones I could from my imported queen, and as few as possible from my other queens. I did this by placing one or two new drone combs in the center of the colony concombs in the center of the colory com-taining the imported queen, and re-moved every drone cell I could find in the other colonies. My neighborhood was full of black bees, and I only suc-ceeded in getting 2 or 3 purely ferti-lized queens the first summer. The following and subsequent summers I furnished all the queen cells I could to my neighbors, and aided in every way I could the introduction of pure Italian bees. Year after year I worked away in this direction, accomplishing but little that was satisfactory, until the present season.

Last fall there were over 200 colonies of bees in Burlington, and this spring there were less than 25, and 12 of this number were my own. This furnished me a "golden opportunity" to purely Italianize my bees and cross them as I desired

m as I desired. During the summer of 1879-80, I bred

my queens from the one I received of Mr. Benedict. The past summer I have had things pretty much my own way, and have had my queens nearly all purely mated with my best drones. When using one queen for breeding queens, I allowed her to produce as tew drones as possible, and selected those colonies from which I wished drones, and encouraged them to raise all the drones possible. In this way, the queens trom the Benedict stock were impregnated from the drones of the Oatman queen, or the imported one. In this way I have crossed from one. In this way I have crossed from the three queens named year after year, destroying every queen that did not suit me after she was tested, until 1 found myself the happy possessor of 40 colonies of the finest looking bees I ever saw. This work has been an exever saw. This work has been an ex-pensive one, for when I would find a queen not up to the standard in some queen not up to the standard in some small particular. I would decapitate her, and thereby interrupt the work of the colony at a time when a great loss of honey would be the result, but at such a time a poor queen may vitiate your apiary, for her drones are almost sure to be successful in meeting more appears than any others, at least it has queens than any others, at least it has

white combs will produce light-colored queens, while dark combs will produce light-colored queens, while dark combs will produce darker queens. I have not found this statement to be true, but there

can be no doubt about new combs producing larger workers than old ones, and for this reason it is not well to use combs that are 3 or 4 years old. Indeed, we would have larger bees if the yet I do not know that it would be profitable to do so.

There are a second to be 
There are many queens that will stand the test of purity, if you only examine their worker and drone proexamine their worker and drone progeny, but when you test them to see if they will produce young queens like their mother, they are found wanting. When the workers are uniformly well marked, it would seem that this queen progeny should likewise be perfect, but I do not always find this the case.

This is to me a most fascinating subject, and pleasure, rather than profit, has prompted me to give the "improvement of the race of bees" my careful and patient attention.
Burlington, Iowa.

For the American Bee Journal.

### Are Cyprian Bees of Value to us?

J. V. CALDWELL.

There can be no doubt but that we need all the evidence and facts in the matter to arrive at the truth, and to satisfy ourselves as to which is really the best race of bees. All things considered is what should be the constant sidered is what should be the constant aim of all unbiased and intelligent apiarists, and one of the best ways is to compare our experiences, and then take the bulk of the testimony.

About the 1st of July last I received from Mr. D. A. Jones an imported Cyprian queen, for which I paid him \$10.00, thereby hoping to get

one of his best queens, and have no doubt he sent me such. I introduced doubt he sent me such. I introduced her at once to a queenless colony, and in due time she began to lay, and I at once reared queens from her brood for such of my customers as had ordered them. The queens were very good, so far as looks were concerned, but so far as looks were concerned, but acted like wasps on the comb, nervous and fretful. The worker progeny of the old queen was always on the lookout for an opportunity to sting, ntterly refusing to fill themselves with honey, but constantly roaming over the combs and from one end of the hive to the other, and, by merely pointing our inger at them, they are ready to fly at it and leave a sting ready to fly at it and leave a sting, and, as we all know one sting is apt to be followed by another, this is a serious fault.

As to the qualities of the hybrids I As to the quantities of the hybrids I know nothing, having shipped the young queens as soon as fertile, and having no desire to experiment farther with them and get the blood mixed with my princely Italians. I have raised no Cyprian drones, having received my queen too late, consequently lived as the first fare from the time of ceived my queen too fate, consequently my Italians are free from the taint of Cyprian blood. As to my Cyprian colony, I have decided to kill them and take their honey as soon as the honey season closes entirely. If they were extra good honey gatherers, it would, in a measure, compensate for their fero-cious natures, but in this they did not equal any of my Italians, though in a good colony, and having had but too or three combs removed to breed from. This is the result of my exper-iment with the noble Cyprian. Cambridge, Ill.

For the American Bee Journal.

### Bees in Australia.

S. MACDONNELL.

Since I last reported the condition of the two colonies of Italian bees received by us from Mr. A. II. Newman, of Chicago, I have separated the attached combs in one of the hives. I found the number of bees to be very weak, as there were not more than any ficient to cover two combs. than sufficient to cover two combs. searched carefully for the queen but without success, and my fears of the hive being without a queen were raised, until I was reassured by seeing a small patch of sealed brood in the

center of the center comb, which patch of brood a week or more later I found had increased from about one inch to about tive inches in diameter. The immerical weakness of the bees The immerical weakness of the bees suggested the advisability of uniting a quantity of black bees with them and here I felt the want of that advice from experienced and practical bee-keepers which appears to be so readily given both personally and by print to all who ask with you in America. As the Pacific Occan separates us from the source of advice, I found myself without a better guide in my emergency than my handbooks in my emergency than my handbooks and bee-papers. As the colony, not-withstanding its weak condition showed sufficient vitality to increase its brood patch in the manner des-cribed, and bearing in mind that I had had no experience in uniting, and that my Italian bees were too valuable for an apprentice hand to practice uniting with, I deemed it advisable to choose the lesser of two evils, by leaving them alone.

ing them alone.

I have not yet had an opportunity of separating the attached frames of the second hive of Italians, but have several times opened it and found it somewhat better populated than its neighbor, although by no means strong. I therefore have hopes of seeing both colonies in a position to work with when summer approaches

ork well when summer approaches. So far I have been careful to avoid to establish the Italian bee in these parts. I much dreaded offering any opportunity for robbing, when opening the two Italian hives, and have. therefore, made use of a bee-proof chamber for that operation. This, however, necessitates carrying the hive to the chamber, a proceeding not free from disadvantage.

Sydney, Australia, Sept. 6, 1881.

#### The Golden Honey Plant Again.

G. L. TINKER, M. D.

In answer to some inquiries and as a matter of general interest, I will say that the golden honey plant is one of the largest of our indigenous plants. Upon measuring the height of the tallest plants I was surprised to find many 10½ feet high, and the average height on rich, moist soils will not fall below 8 feet. On uplands where it produces the finest and most numerous heads of flowers, the height will ave-rage about 7 feet. In many cases 30 stalks were counted from one root, on each stalk an average of 100 heads. each containing an average of 30 florets, or a sum total of 90,000 honey receptacles or florets on a single plant The heads on each stalk rnn from 50 to 275, and the florets on each head from 15 to 53. These facts were calculated from the number of seeds in each head, each seed having been crowned with one floret.

The plant is a perennial, but will grow up from the seed and bloom the first year, sending up only one stalk. The second year two or more stalks sprout up and on some old plants as wear, and all so all growing reasons. many as 32 stalks, all growing very high, were counted.

The roots are large and the rootlets go down deep into the soil on uplands, go down deep into the soil on uplands, and spread out two or three feet on lowlands. The foliage is deuse, and where the plants are thickly, completely shades the ground so that nothing else will grow. No animal will feed upon the plant and it would seem to be of no use except to furnish the richest nectar to the honey bee.

The seed may be sown by seed each.

The seed may be sown broadcast in the fall or any time during the winter, on prepared soil, or it may be sown in rows three or four feet apart. Many seeds, however, will come up and the plants take care of themselves if sown anywhere. After ripening, the seed becomes dry and mostly falls to the ground before winter. Many the seed becomes dry and mostly rans to the ground before winter. Many seeds have been on the ground some-time, but whether they will sprout or not without being subject to dampness and frost I am unable to say. New Philadelphia, O., Oct. 7, 1881.

For the American Bee Journal.

#### Red Clover Bees.

R. SHERFY.

The past winter here was alike destructive to the bees. There were but few fruit blossoms in the spring to supply them for early breeding. Locust and poplar did well; white clover contained but a small amount of nectar; had too much rain during the white always serson braning the hear white clover season, keeping the bees only in a fair condition for breeding. About a week after the white clover ceased to bloom, the second crop of red clover began to yield a splendid flow of nectar, which lasted about 3 weeks, the time being lengthened by several fields having been mown at different times.
Out of 40 colonies under my control,

36 worked diligently upon the red clover. I have been breeding from my best colonies, and importing new blood when deemed necessary, with the view of obtaining a superior bee, and at last have had the exquisite pleasure of realizing my desires.

I devoted but few of my colonies to surplus—nearly all to building up. One colony gave me about 25 lbs. of red clover surplus, besides filling up of the main body of the hive.

At the time that the red clover was in bloom, the air appeared to have the proper humidity for the secretion of nectar. The bees (Italians and well marked hybrids) worked as freely and as diligently upon the red clover as I have ever seen them work upon the white clover. I am not certain that my Italians possess a longer ligula that those of other apiarists, or that the corollas of the red clover in this section are shorter than those in other sections, but there is one thing that I sections, that there is one thing that is an certain of, that is, we must have a strong bee if we wish to secure honey from red clover. The bee must have the power to force its head a certain distance into the corollas of the clover. I have noticed that many bees force their heads into the corollas and sip their contents, and with difficulty, extricate themselves. We must combine "strength with length of tongue" in order to secure Apis Americana. Gettysburg, Pa., Oct. 4, 1881.

For the American Bee Journal.

## Effect of Pollen on Bees in Winter.

A. R. KOHNKE.

Reading the very interesting dis-cussions of the North American Bee Keepers' Society in Lexington, Ky., I Neepers Society in Lexington, Ky., 1 have particularly noticed the different opinions in regard to pollen, especially those entertained by Prof. Cook and Mr. C. F. Muth, as being of opposite characters. Now, as both gentlemen are experienced bee-keepers, whence this diversity of opinion on a question as important as this one is?

as important as this one is?

To arrive at a more certain conclusion, I will raise the following question: Will the presence of pollen in any large amount prove injurious to bees, provided they are all right in other respects? It can hardly be supposed that the presence of a natural necessity in large amounts should induce bees to gluttony and cause sickness. How Prof. Cook could arrive at ness. How Prof. Cook could arrive at such a conclusion as he did without limiting his statement, I cannot perceive. Mr. D. A. Jones is most likely correct in presuming other causes which work the injury. Prof. Cook, in his prize essay on wintering bees, mentions 4 points to be observed: 1. A uniform temperature. 2. Plenty of wholesome food (to which not only honey but nollen belongs). 3. Good. honey, but pollen belongs). 3. Good

queens. 4. Absorbents.
Rev. E. L. Briggs, in his essay read at the Convention in Philadelphia, 1876, enumerates also 4 causes of loss: Starvation. 2. Intense and protracted cold. 3. Damp, moldy combs.
 Unwholesome food.

Dr. Rush, in his essay, also read at that Convention, mentions 5 points to another page, and take advantage be observed: 1. Good, tight and dry the fall gatherings to get up clubs.

hives, 2. No drafts of air, 3, A good queen, 4. Young bees, 5, Sealed

It is rather singular to note the omission of one point, which is as necessary to observe as any, or all of them for good wintering. That one point above all others is "quietness." This does not only mean not to disturb the hees by taking the hive apart, or moving from one place to another, but there are many causes which may disturb them. It will have been noticed by all observing bee-keepers that bees are more sensitive to jars than noise. Anothing that will invest a jar to the are more sensitive to jurs than noise, Anything that will impart a jur to the hives will arouse the bees, elevate the temperature in the hive, and the bees filling themselves with honey, distending their bodies and causing an undue accumulation of waste matter (feces) in them of which they cannot rid themselves in cold weather. The consequences can easily be forefold consequences can easily be foretold.

Jarring of the hives may be imparted directly, or indirectly. Directly by nice, rats, cats, dogs, birds or other animals which gnaw, or peck or jump on the hives, or even by the bec-keeper himself, who raps on the hives to see if the bees are still alive. Indirectly by jarring the ground where the hives stand, which may be done by passing trains, fast driving of teams over the hard, frozen ground, as also by the running of larger animals as cows and horses; by cutting and splitting wood, felling trees, etc. Such jars are conveyed quite a distance through frozen ground, and it is absolutely necessary to protect the bees from them if we wish to be successful in wintering.

To sum up, dysentery may be caused by, 1, poor food, 2, want of plenty of young bees (caused by want of food in early fall, or poor queen). 3, disturb-ing the bees when they should enjoy perfect quietness. The first two points have been discussed repeatedly, but the third has never so much as ever

received a passing notice.

For this last reason 1 consider outdoor winter preferable to moving
them late in the fall into house or celthem late in the fall into house or cel-lar, as that is evidently a disturbance which should be guarded against. For this reason, also, I am of the opinion that a large per cent. of bee-keepers wintering out-doors go to work too late in the fall to protect their bees from severe weather, disturbing them that way. Other causes may be disthat way. Other causes may be discovered in course of time, but the presence of pollen, I think, will not be one of them.

Youngstown, O., Oct. 16, 1881.

For the American Bee Journal.

#### The Season in Quebec, Canada.

THOS. VALIQUET.

The apicultural display at our Provincial Exhibition, held in Montreal, in September, amounted to but little.

There were a few colonies of Italian bees exhibited, but there had been no preparation made for bees, they consequently had to be placed at the side of a building on the ground. There was some honey in sections, also some extracted honey in pots, but it attracted very little attention on account of being placed among many other articles such as beets, potatoes, etc.

Some of the bee-keepers present desired to form a Bee-Keepers' Association, and I hope they may succeed.

The honey crop in this Province is a little above an average; but white and alsike clovers failed; basswood yielded well, but was later than usual in blooming. Swarming has been plentiful. On the whole bee-keepers have had a very fair year in the Province of Quebec. The hives are well stocked with bees and honey.

St. Hilaire, Quebec, Sept. 23, 1881.

It will pay to devote a few hours in getting up a club for the BEE Jour-NAL. Read the list of premiums on another page, and take advantage of

#### Kentucky State Convention.

The meeting was called to order at p. m., Oct. 12, at Exposition Building, by Dr. N. P. Allen, President.
The minutes of last meeting were

read and adopted.

everal new members were added to the list, and old members renewed membership by payment of the annual

fee of 50 cts.

The Secretary stated that he had : letter from the manager of the Galt House, offering to provide rooms for the meeting of the Association free of charge, and to make hotel rates for delegates S2 50 per day.

President Allen then read his au-

mual address, as follows:

Another year has passed, another harvest has ended since we last met in convention. Winter, spring and sum-mer have all come and gone, and auturn is at hand with its ripened fruits and withered flowers—with its brown and seared leaf, which tells us of the evening of life which is fast approach-We look back over the days and months that are gone, and meditate upon the toils and labors, successes and disappointments, joys and sorrows which were the portion of us all as we passed through them. Our lives have been spared, and we would re-turn thanks to God, the giver of all our blessings, for his tender mercies and loving kindness.

The past winter was unusually long and extremely cold. Many colonies of bees perished before spring opened. Many apiaries were so depleted by the death of whole colonies and the heavy loss in those that survived, that there were not bees enough in early spring to build up rapidly from the spring flowers, but in course of time the weak became strong, and the poor became rich, and the increase by artificial or natural swarming soon filled the empty hives, and in favored localities, a fair crop of honey was gathered in the early part of the season. But in the milst of the white clover harvest the rains failed, the excessive heat parched rains rathed, the excessive heat parched the earth, and the honey flow ceased. The crop was cut short—a long protracted drouth set in, and not only bees suffered, but stock and crops of all kinds shared the common fate. But the latential resistance in the common fate. But the late rains revived vegetation and the fall flowers, such as the smart weed, the golden rod and the aster, have enabled our bees to regain their depleted stores, so that in most cases they have sufficient for winter.

I had hoped to have a statistical re-port to lay before you of bees and honey in the State, but can only refer you to the reports of Vice-Presidents

for such information.

I recommend that a Vice-President be appointed for every county in the State, and that they be required to make a report at your annual meetings of the number of colonies and amount of homey in their respective counties; also the kind of flowers furnishing theorem. nishing the crop, and any other items of interest to bee-keepers. By this means the best localities in the State for locating apiaries can be ascertained, and the honey resources of the

State developed.

1 would also recommend that more attention be given to the cultivation of honey producing trees, shrubs and plants for bee pasturage. This can be of honey producing trees, shrubs and plants for bee pasturage. This can be done by planting in fence corners, roadsides and waste places, with such trees, shrubs and plants as produce honey. Of the trees, we would recom-mend the poplar, linden, elm, maples, willows breasts and persimpon. Of willows, locusts and persimmon. Of the shrubs, the sumac, corafberry, gooseberry and raspberry, and such plants as grow without cultivation, as

ommended for cultivation in our gardens and fields that answer a two-fold it would pay anyone to transfer from purpose, the hay and seed crop being old-fashioned to Langstroth hives, but valuable for stock, as well as affording rich pasturage for the honey bee, among other hives. The various clovers, such as white clover, alsike clover. Japan clover, melilot and Bokhara, are all valuable honey plants.

We notice quite an interest is being manifested by bee-keepers in books on bee-culture and in bee periodicals. We now have a BEE JOURNAL published by Thomas G. Newman, Chicago, Ill. No bee-keeper can afford cago, Ill. No bee-keeper can afford to do without its weekly visits, as its pages are brimful of the latest and best news.

We notice with pleasure the progress made in the modes of obtaining and marketing the honey crop. Many are using the one and two-pound sec are using the one and two-pound sections for comb honey, and the one and two-pound glass jars for extracted. These neat little packages, put it in fancy shape, thus making it more attractive, and in small quantities, thus bringing it in the reach of all classes of consumers. of consumers.

We also have for the encouragement We also have for the encouragement of the bee fancier the different races of the honey bee from which to select; new bees are being imported from year to year. New inventions are being made in apiarian implements, hives, honey boxes and sections. Comb foundation is being used in the broad department as well as the surbrood department as well as the surplus honey department.

In conclusion, allow me to wish you prosperous session, and success and happiness in all your undertakings.

Dr. Allen said that Mr. Jones, of Canada, stated at the Lexington meeting that he would gnarantee that one acre of Bokhara clover would produce 1,000 lbs. of honey. He uses it exclusively for bee pasture. He sows in strips across the ground, the plants growing 4 and 5 feet high, and falling on the open strips. The next very the on the open strips. The next year the open strips are seeded, and are covered with the new growth, and the old strip becomes vacanf. Dr. A. thought this clover would grow here.

Dr. Kaye suggested that winter turnips be added to the list of honey plants. Mr. Craycraft also advocated Scoteli kale.

W. Cook, Dr. Kaye and A. Schneider were appointed a committee on resolutions, with instructions to take up the President's address.
I. B. Nall, Treasurer, read his report, which was adopted.

The President then appointed the following committee on nominations: Dr. L. E. Brown, William Cook and A. W. Kaye, to report on Thursday

morning.

The Secretary read a letter from Mr. W. T. Sears, regretting that owing his to sickness he could not prepare his article. The President suggested that a discussion on "Transferring of Bees" he held.

Bees" be held.

W. Cook moved that the President ppoint some member to write an article on transferring.

Mr. Williams amended by requesting that the President write such an article, and publish it in the Farmers' Home Journal. which motion, as

amended, prevailed.

The President, while accepting, suggested the discussions on the subject.

Mr. Cook thought it best for persons who have transferring to do should do it themselves, as the way in which they may learn. He said last spring he had an old Langstroth hive to transfer. He propped up one side, smoked the hees, took off legs, and one side out, took out the combs and brushed off the bees all right. But just then all his own and all his neighbor's hear made an attack man him. who have transferring to do should do bor's bees made an attack upon him. All the bees in the neighborhood were on the war path. But after a while he got his bees in the new hive and left a small opening. Still the bees were not satisfied, and continued to fight one another. Water failed to appears vation, as another. Water failed to appease them, Next morning the battle began again, and a half gallon of bees oney-pro-

hive is now doing well. He thought this avocation. Indeed, if they could

Dr. Allen, in transferring comb, presnound be cut to it in trainer, frede-monstrated his plan. He first smokes and puts on a swarming box. He then thumps on the hive and the bees go into the swarming box. He has a transferring board, and after remoying the comb to a room, it is fitted to the new frames, which are then tied in with the twine. He throws out all the drone comb, and keeps the honey comb as much as possible at the top and at ends. The brood comb is put and at ends. The brood comb is put near the center of frame. The frames are then set in the new hive and filled out with empty frames, when the hive is set where it is to stand. Location can be changed if desired when transferring.

II. II. Littell does not use twine transferring, as the bees pull at it to get it out of the hive. He prefers to transfer in a honey season; proceeds as the President does, except he tacks a light strip across one side of the frame, inserts the comb, turns it and tacks a strip on the other side. In a day or two the strips can be removed without difficulty. He thinks bees should be examined frequently. Has s colonies which have done well until the drouth came on; but as bees robbed groceries so badly, he thought he would have to remove them to the country. He uses Langstroth hives. He thought hives should be painted inside, as the bees would not then connect the comb in frames with the

The President objects to strips, because in using them he found it destroyed so much of the brood.

Mr. Knight uses pins stuck through holes in the frame, and where the comb is in pieces he uses twine.

A member stated his plan of fastening comb in frame was by a slot lengthwise at bottom of frame.

Col. Maginness extended the courtesy of the Exposition to members of the society, and was voted a resolution of thanks.

James Erwin's essay was read, on the

#### Pleasures and Profits of Bee-Culture.

The study of nature ever brings with it a pure and quiet source of enjoy-ment not found in the busy marts of trade and commerce. Perhaps no class of manual laborers have free access to this source of pleasure than the pro-fessional apiarist. To him, the study of nature in the wonderful transfor-mations which insect life undergoes, and the delightful harmony which pre vails in this insect kingdom, is a part of his daily observation. And in quiet communion with the visible forms of the great architect, in the realm where instinct is supposed to sit as umpire, the reflective mind is insensibly led to the reflective bind is the ensibly led to contemplate the possibilities of created existence, in a state where the will of Him "who doeth all things well," shall be universal law. Man's natural love for the beautiful, may also be gratified in the adormnent of grounds, construction of hives, the cultivation construction of fives, the cuntivation of rare species, and in the study of plants and flowers, while the period of leisure afforded in the winter season, gives time for study and recreation. These things beget an enthusiasm, which lightens toil, and makes becausing man of the posts delightfol of keeping one of the most delightful of occupations.

But I come now to the second division of my subject, Profits, which, to the practical mind, will be of first importance. The question is, Can bee-keeping be made profitable? I an-swer, yes. This conclusion is not deswer, yes. This conclusion is not derived merely from theory, but from considerable experience in the care and cultivation of bees, It is a matter of positive knowledge that bees, when

it would be an exception to all other lines of business; men fail in every business, but the failure is in the man, and not in the business. I have premised that bee-culture, as an ayo-Dr. Allen, in transferring comb, pre-fers to tie the comb into the frame cation or profession, contains the ele-with cotton twine. He says the comb should be cut to fit the frame. He de-monstrated his plan. He first smokes ages, but it is only within the past de-and puts on a swarming box. He then thumps on the hive and the bees go has received that attention from into the swarming box. He has a thinking men, that its importance de-transferring heart and after remove-mands. And in this, as in other lines mands. And in this, as in other lines of business, it is only thinking men that can achieve any marked success. This is the age of brains—an age in which men are developing all the resources of wealth which a bountiful Providence has provided. And as God has provided the health-giving, lifesustaining nectar in abundance in the myriad of beautiful flowers that deck our fields and forests, and also provided the bees to gather it, and endowed them with instincts which lead them to store it up in quantities far exceeding their own wants, it would seem that the beneficent Creator intended that man should utilize these gifts, and make them conducive to his own well being.

I shall now come to consider those qualifications which bespeak the suc-cessful apiarist. And first of all, I would say in general terms, that he should possess a thorough knowledge of the requirements of the business. This would include a knowledge of the natural history, habits and instincts of bees; a knowledge of the best hives bees; a knowledge of the best hives and implements in use; also a knowl-edge of the honey resources of the lo-cality in which he should choose to lo-cate. The practical management of bees at different seasons and under different circumstances, and how to produce the most honey in the most marketable condition, can only be learned by wrigingless in the learned by practical experience in the apiary. Of course, the amount of honey produced will vary in different localities, and in the same locality in different seasons. In our locality (Al-len county), where the extractor is used and only strong colonies kept, I think an average of 40 lbs, per colony, one year with another, a good yield. This (when it is remembered that one This (when it is remembered that one man can easily care for 100 colonies), at the average price of 10 cfs. per lb., will give \$400—fair wages, considering that the bees will not require more than 6 months labor during the year.

I think, however, that the greatest

effort, is the diffusion of knowledge among the agricultural classes in regard to the true principles of scientigard to the true principles of scienti-lic bee-culture, as by these means, in time, perhaps enough will engage in the pursuit to develop the honey re-sources of the State, and thus add to the revenues of the State a source of

wealth now undeveloped.

#### Reports on Wintering Bees. The President wintered 10 colonies,

The President wintered to commes, lost 1; received 2,000 lbs. honey; had 3 natural swarms; made 3 swarms, and has 45 strong colonies, rich in stores. Thought he had at present 500 surplus honey

Dr. Brown commenced with 33; lost 13; had 4 natural swarms; got 500 lbs. honey; wintered on summer stands.

W. Cook put 5 colonies into winter quarters; lost none; has made 5, and had 4 natural swarms; lost 3; has 12 colonies now; has taken 60 lbs, honey;

colonies now; has taken 60 ms, noney, every hive but 2 has a surplus.
G. W. Ashby had 33 colonies in the fall; lost 22; wintered on summer stands; took 300 lbs, honey; has 30 now, all but 2 in good condition.
Mr. Littell, Louisville, started the winter with 5 colonies in Langstroth, handla-wall hives; saved all; had 4

winter with a colonies in Langstroth, double-wall hives; saved all; had 4 swarms, saved 3, and has 8 colonies in good condition; fed the weaker ones on sugar during the fall; took 90 lbs.

Dr. Kave started with 30 colonies. half of them weak; lost 14 from the motherwort, catnip. Simpson them, Next morning the battle behave honey-producing flowers. All of these have honey-producing flowers are also rec-

crease of bees. He has Langstroth educated and filted for the business chaff hives.

Mr. Kansler, Spencer county. Ind., Aff. Kansier, Spencer county. 11d., had 21 colonies on summer stands protected by corn stalks, with padding under the cap; lost 3 in winter, united 6, which left 12; clover was killed and bees gathered no surplus honey.

those in cellar, where he took off tops, did best

Dr. Allen agreed with Mr. S. in this. L. Hofstetter, Louisville, commenced in spring of 1880 with 14 colonies, and increased to 28; fed on glu-cose; lost 14 in winter; had 200 lbs, honey; those he divided and fed did not do as well as the others. He pre-

not do as well as the others. He pre-ferred using glucose to sugar syrup, because the latter granulates in spring. Mr. Moberly, Hardin county, put into winter quarters 40 colonies in Langstroth hives; covered top of hives with old quilts; lost but I, and had 6 swarms; took 400 to 500 lbs. honey; bees are now in good condition. He will not feed glucose, but prefers gran-

ulated sugar syrup.
Mr. Littell said even if the sugar syrup granulates the bees will dissolve

provided with water. r. McConnell, Shelby county, Ky. put into winter quarters 65; lost 14; wintered in common frame hives on summer stands; used carpeting on top with a little straw on it, and in other ways; found those with straw on top did best; had but 600 or 700 lbs. of honey this season; had 24 natural swarms, but divided some; fed some honey to weak ones; has 69 in good condition now. His bees are mixed.

Mr. Craycraft, Salem, Ind., put into winter quarters 41 colonies in doublewall hives; lost all but 3 from dysentery; thinks it was caused by bees fill-

ing hives in the fall with fruit juices. Mr. Knight, Oldham county, put 17 colonies into winter quarters; lost 3,

and I in spring. Has now 28.
Mr. Ladler, Jefferson county, wintered 3; increased to 8; made 300 lbs. of good honey; all are now in good condition; wintered with quilt only

on top.

The President appointed Mr. Hofstetter, Mr. A. Schneider and Mr. Moberly a committee on apiarian sup-

Adjourned to meet at 7 o'clock p. m.

EVENING SESSION.

Called to order at 7 p. m., an essay by Dr. Ed. Drane, Eminence, Ky., was read, on

Bee-Keeping a Specialty

When I first caught the bee fever and began to make bee-keeping a success, I thought everyone that loved honey ought to keep bees—at least a few colonies, to gather the pure nectar offered as a free gift to all, or any who may choose to receive it. But I have may choose to receive it. But I have seen so many bungling attempts at bee-keeping—have had such poor success in persuading others to learn how to keep and treat their bees, so as to reap a profit, that henceforth, instead of advising people to keep bees, will insist that they study apiculture first; then, if they choose, they can make profitable use of their knowledge. Any one might practice medicine without having studied the profession, and but few of his patients would ever expose his ignorance, for they would be buried out of sight.

All the professions, trades and vari-All the professions, trades and various pursuits in life are fast drifting into specialties. One M. D. makes a specialty of treating the eye, another the ear, another the bowels or lungs; one merchant makes a specialty of ready-made clothing, one of piece goods, one of hats, one of toys, etc., and the most successful in the various pursuits are advented or have been pursuits are educated, or have been

they follow-the doctor, lawyer and merchant, in schools and colleges for their especial training. We should advise people to study bee-keeping first, and then to keep bees, if they Ar. Hamilton, Louisville, had 48 colonies in fall, 26 in spring; took 700 shoney; wintered on summer stands packed with 8 inches of straw; has mostly Faulkner hives.

Mr. Schneider, Louisville, started with 35; all but 9 in dry cellar; prefers cellar wintering; has mostly Langstroth hives; lost 2 in cellar; kept the temperature at 40 to 43-; sold 8 hives; increased by artificial means to 35 again; had 500 lbs beat those in 600. future and examine his bees and show him everything necessary to be done in order to make bee-keeping a cess, and if advised to read, is always ready with the reply, "I have not time." Two chances to one the beekeeper he has applied to for instructions is the wrong man, who has never been to school and read the proper books on bee-keeping, but he feels books on bee-keeping, but he feels tlattered in proportion as he is ignorant, and with great generosity, and perhaps more ignorance, gives the applicant bad advice, which will result in rnin and loss if followed. Therefore, I think we should caution or admonish novices in bee-culture, or those who senten what the keying bees, to be who contemplate keeping bees, to beware of whom they take advice; gratuitous advice is generally looked upon as like bad medicine.

I believe that if the number of suc cessful bee-keepers was double what it is now, and the production of honey was increased in the same ratio, the was increased in the same ratio, the consumption of honey would be increased and popularized in even a greater ratio, and that bee-keeping would be more profitable than now. I have no fears of an over-production of honey. Just have it in merchantable shape, so that it can be handled like lard, meats, sugar, or butter and cheese, and the world will consume it at good prices; but such will not be the case until bee-keeping becomes more of a specialty.

Mr. Hofstetter said he thought all

Mr. Hofstetter said he thought all persons who liked keeping bees should be advised to do so, but, as a professional bee-keeper and honey producer, he did not think it advisable for bee-keepers to advise the public generally to go into the business, as it would bring them in strong competition with ourselves, and tend to profits.

Dr. Allen thought that some were adapted to one profession, and some to others, and that only a certain class, not one scarcely in a hundred, would succeed in bee-keeping. He once not one scarcery in a mindred, would succeed in bee-keeping. He once thought all persons should keep bees, but he had changed now, and thought only those who were adapted to the ousiness should be advised to keep them.

Schneider thought the matter

Mr. Schneider thought the matter would regulate itself, and those not fit would soon give it up in disgust. He did not fear the competition.

Mr. Cook argued that bee-keeping was not a specialty. It requires no particular talent, no more than to raise corn, make cheese or raise fruits. He theretally results the second of the contract of the contrac Alle thought bee-keeping might be well extended among the people as any other business.

Mr. Williamson remarked that Mr.

Newman had said that the demand f American honey in Europe was on the ncrease, and that it could never filled, as with increase of supply the

increased demand arose.

An essay by W. T. Stewart, Eminence, Ky., was read, on

#### Honey Producing Plants and How to Cultivate Them.

As I furnished an article on this same subject for the National Convention at Lexington, which will be published in the AMERICAN BEE JOURNAL, I shall now go over the same ground of "comparing advantages and disadvantages and disadvantages and disadvantages." published in the American Bee beds, and even around the door and Journal, I shall now go over the same ground of "comparing advantages and disadvantages in order to know what is best to cultivate," but will only continue that article, and stantly perfumed, and you will be

give a few brief hints as to lawn-

planting of honey producing plants.

As I have clearly shown in the former article that figwort (or Simpson honey plant), motherwort, catnip and melilot are the 4 best plants (to my knowledge) for cultivation, I will now give you a practical pen-picture of a most beautiful lawn or door yard, and especially beautiful to a bee-keeper, and passers-by will, from the novelty of plan, pronounce it superb, as I know from experience. While I am in my from experience. While I am in my photographic studio at the front of my door yard with about an acre of lawn door yard with about an acre of lawn (in which my apiary is located) between my gallery and dwelling. I often hear such remarks as "Just look at that yard, ain't it beautiful?" "Here is that pretty yard that I told you about." "He's got the prettiest yard in town, ain't he?" "He is a perfect genius; can take a patch of weeds and make it look pretty. I never saw such a man, he never stops fixing pretty things." Now, while I enjoy all this praise, I at the same time enjoy seeng my bees working on almost every thing growing in this yard. My pretty weeds are all honey producers, you know, and did not come there by accident, either. Now I tell you how to do it, and after you have once seen such a lawn, you will be surprised at its grandeur, and why you had not thought of all this before.

To make a beautiful mound, or what will appear to be a mound, yet is only level ground, plant that which grows tallest in the center of a ring or circle, next tallest outside of that, and so on down to a creeping ground plant. For instance, you want a mound twelve feet across, six or eight feet high in center, gradually sloping off lower until it is on a level with the ground. nntil it is on a level with the ground. You will first mark it off in rings, say eighteen inches apart. Now transplant in the center ring eight or ten line plants of figwort; it grows six to eight feet high, filled with beautiful seed pods as large as buckshot. Next row transplant with golden rod; grows four to six feet high. Next transplant is required to five row plant in spider plant; three to five feet high, and its pretty pink flowers contrasting strikingly with the golden rod. Next row transplant with motherwort and catnip mixed equally; two feet high; bloom white. Next row plant princess feather; bloom is scarlet and an excellent honey plant. Next row, white mustard; one foothigh; bloom golden yellow. Next row transplant peppermint; bloom white. Lastrow, ground innit; moon write. Lastrow, ground ivy, a creeping vine, and good for bees. This will, when grown up, ap-pear to be a costly mound, most beautiful to the eye of man or bee. We can make a basin in the same way by reversing the plants, putting the lowest in the center, and so on. By a little study and ingenuity in planting we can contrive many pretty designs we can contrive many pretty designs that cost nothing, and have every plant to pay nearly as well as vegetables in a garden. Plant in groups of various colored bloom and varied foliage, too, among our bee-hives, making them contrast with the color of the bives set. Planta rowed bases of the hives, etc. Plant a row of bass or the fives, etc. Planta row of bass-wood, poplar, locust, elm or maple all round the fence, and keep trimmed nicely. Plums, pears and cherries among your hives for shade, honey and fruit; gooseberries, currants and raspberries can all be made orna-mental in the shape of hedges around poultry yards, garden walk,, etc., and all are good honey plants, too.

For trellises, around porches, verandas and windows as a running vine, there is nothing superior to the Clematis for beauty, shade or honey. Various colored hollyhocks may be used to advantage in grouping or single; it is also a good honey producer, but better for pollen. A few stalks of buckwheat worked in for variety or contrast, don't look badly. Make a border of peppermint on each side of every walk and outer edges of flower

surprised to see how much mint you surprised to see how much mint you can have growing in this way, and also surprised to see how the bees take to it through Angust and Sep-tember—just when they need it. If you have a low, wet spot on your grounds, plant there a clump of wil-lows. With a group of six or eight willows growing to you have a result of the prowillows growing on your lawn you can make it the center of attraction. By bending and tying them together you can make them grow in every con-ceivable shape—chairs, ladders, hoops, etc., can be had growing; besides, it is beautiful as a shade tree, and one among the most useful of all honey producers, because it comes so carly in the spring and is full of nectar for early use. Plant a tree of either elm or basswood (twelve feet apart is about right) one on early side of your about right), one on each side of your gate; when they arrive at the right height bend and tie them together in the form of an arch; keep them tied until they have grown in that shape. An arch over the gate is pretty, and these trees are good for forage.

Make a ring or diamond of ten feet in diameter and transplant into it dandelions six inches apart all around dandelions six inches apart all around the outside, then fill up the center by transplanting wild turkey peas, thickly set. This is very pretty; early in spring the bed will be white as snow and the border yellow. Both are good honey producers, and they come so very early that they are quite a luxury for our bees. A hedge all around the fences of motherwort is quite a bonanza. You will notice that most all the plants I have named for ornamentthe plants I have named for ornamenting are such as will only require planting once, and come from the old root ing once, and come from the old root for years afterward. Remember, that it is the design and in the inge-nuity displayed in planting that at-tracts the attention of visitors more than the quality of plants. Common plants when ingeniously modeled are prettier than costly green-house plants scattered belter skelter, without any pretense to form or model. But when you have laid out beautiful models of pretense to form or model. But when you have laid out beautiful models of common plants, your wife will be sure common plants, your wife will be sure to improve their appearance by the addition of a few pet green-house plants, which are not honey producers themselves. But they won't drive the bees away from those that do produce it. When once we have introduced this novelty in our town we will soon see our neighbors trying to imitate it more or less, because of the novelty of it (not for bee forage). But our bees will go over and appropriate it to their use just the same as if it was purposely for them. But we must keep still as to the purpose of such a lawn, and let people just think that the novelty of the thing is the main point, if we wish them to appreciate it or pattern after it on their own lawns. If people in general knew that such a lawn was intended for forage for bees, it would lose half its charms in their estimation; but work on, getting up novelties, and say nothing about the bee part of it, and you will see that it is contagious, and people will gradually full into worker. ple will gradually fall into novelty lawn planting.

awn planting.

Col. Nall was particularly pleased with the encouragement in this paper to beautify homes. Then that mint—no one but could find use for that.

Dr. Allen thought the number of

Dr. Allen thought the number of honey-producing plants might be in-creased around farms, and add to the supply of honey, especially in the fall. Mr. Cook thought the wild aster an

Mr. Cook thought the wild aster an excellent honey-producing plant. It is spreading in Southern Kentucky in low, rich bottoms, and bees swarm around it. He also said the prickly ash was another useful plant. It will grow almost anywhere, blooms about mid-summer, and makes a blossom bunch. Bees like it. said raspberries were good honey-pro ducing plants, both bloom and fruit of the red being excellent. The straw-berry was worthless for bees; the pear blossom was not good for bees, but the peach first rate. Wild cherry is good, peach first rate. Wild cherry is good, but domestic kinds do not amount to much. Wild grape and crub are both good. Among garden flowers the double varieties are valueless, but the single ones afford bee pasturage.

Dr. Allen said the honey of prickly ash was strong-flavored, and the honey

ash was strong-havored, and the honey gathered from it was not salable. It is not recommended by apiarists. Mr. Schneider said the necessity was for plants to come into the space between fruit bloom and after the white clover.

 $\Lambda$  gentleman stated that he had the spider plant and the Simpson honey plant. The bees refused spider plant as long as the white clover was in bloom, but took to it when clover was

Mr. Schneider, in answer to a question, stated that buckwheat could not

only on occasional years.

Dr. Allen said coral berry was a valuable honey plant for fall.

Dr. Kaye asked about corn, and the opinion was expressed that the bees enthered rollen hin bar much boney. gathered pollen, but not much honey.

Mr. Cook thought the cow pea was

a valuable blooming plant.
Dr. Kaye exhibited some beautiful

#### New York Bee-Keepers' Union.

The Eastern N. Y. Bee - Keepers Association held their 8th semi-annual Convention at Knowersville, Sept. 27. Called to order at 10 a. m., by President W. D. Wright.

Minutes of the last Convention were read and approved. The Treasurer's report was read and approved. Question: What is the best method

Question: What is the best method of marketing honey? W. Tennant. I think we are in too much hurry to crowd our honey on the market. Is it best to report our crop and let the world know how much we have? It is bad on one account; it makes the buyers think the crop is large, and thereby we may lose; on the other hand, I think it is best to report to the commission merchants, that they may have a better chance to that they may have a better chance to its the price and sell our honey. One commission merchant told me he was deceived last year, by the bee-keepers saying the crop was small, and thereby he held his price too high and had to

he held his price too high and had to carry some over.

W. L. Tennant. 1 cut my surplus boxes down from 12 lbs. to 5 lbs., and from that down to the 2 lb. prize box, and can get more honey now than with the larger ones; but some are calling for still smaller boxes. It is an imposition. Why should all use 1 lb. boxes? A few may sell better. You should use the 2 lb. boxes, and nail them strong so they will go to market without leakuse the 2m. boxes, and har trem strong so they will go to market without leak-ing or smashing. Make your box 5x6, so as to use regular size glass, because it is always in the market, and we can obtain it on short notice, and cheaper, besides odd sizes cost more; for every fraction of an inch you have to pay for

an inch, the world over.

A. E. Manum. 1 like the 1 lb. box best; 1 can get just as much honey as in the 2 lb, boxes, and get 2 cents more per lb, for my honey. I can get the bees to work in them sooner by their being low, and when half full raise

being low, and when half full raise them up and put an empty set under them, and so on as needed.

W. L. Tennant. I do without the 1 lb, box entirely, and the price of honey in the 2 lb, box will be just as much as for the 1 lb, box. I must differ with Mr. Manum; they will make 25 per cent, more honey in the 2 lb, box. It is best to establish a medium box, neither too large nor too small, which all is best to establish a medium box, nei-ther too large nor too small, which all can adopt, and then we can sell our honey to the poor, and all can afford to eat it. Now, is it best to sell our honey eat it. Now, is those to sen our noney out-and-out, or send it to the commis-sion merchant to sell for us? They skin us alive. I think it best to sell out-and-out, and then we know what

we are doing.

A. E. Manum. My bees will cap 1

1b, boxes better than 2 lb, boxes, and
suit the market better.

W. L. Tennant uses but one kind of box, placing it on top and not at the side, as they will not till them out as

A. E. Manum. I think sections or well as fi boxes  $\frac{1}{10}$  of an inch thick is plenty; invited.

bee keepers are using sections and crates too heavy; it takes more lum-ber, costs more in shipping, and people will buy the light box quickest.
G. H. Adams. I like the 2 lb. box

hest; I tier them up, and they work well

F. Boomhover. I have had colonies tiered up higher than my head with 1 lb. boxes this summer, and took 190 lbs, of honey from one colony.
G. Van. 1 can get more without

tiering up.

On a vote being taken, 16 were in favor of 2 lb boxes; for 1 lb, boxes, no hands up. Adjourned till 1 p. m.

#### AFTERNOON SESSION.

Question: Which are the best bees

for all purposes—blacks or Italians? W. L. Tennant.—Italians or hybrids for valleys where there is white honey; the backs on hill-tops, where the main

crop is buckwheat.

A. E. Manum. Cyprian bees are stingers. I like the Syrian bees; they are very prolific, more so than the Italians; but as far as my experience goes, I like the Italians best. a cross between the Syrians and the Italians will be good; I have some, but not much experience with them yet; will test them next summer.

Question: If a black queen mates an Italian drang conference with

Question: If a black queen mates an Italian drone, or rice versa, how will the bees be marked?

W. L. Tennant. I can see no difference in which way they mate.

W. D. Wright. One-fourth marked;

W. D. Wright. One-fourth a one-half if mated the other wa

Adjourned to meet at Central Bridge, on Tuesday, Jan. 10, 1882. N. D. West, Sec.

## Northern Texas Convention.

The bee-keepers of Northern Texas met at the Court House in the city of Sherman, Wednesday, Oct. 5, at 11 a. m., for the purpose of organizing a Bee-Keepers' Association. The meeting was called to order by Col. Cockrell, of Sherman, and Mr. W. A. Robredly, of Sherman, and Mr. W. A. Robredly, and Mr. W. Ro inson was appointed Secretary. An opening address by the Hon. Joseph Bledsoe, who made an appropriate speech. The meeting then proceeded speech. The meeting then proceeded to organization. A committee on permanent organization. A committee on permanent organization was appointed, consisting of Dr. A. F. Wright, W. F. Woodward and M. S. Klum. A committee was also appointed to draft bylaws and a constitution, consisting of Messrs. J. L. Mulkey. Dr. Brockette, E. P. Keywood, Hon. J. Bledsoe, J. H. Choice and M. H. Davis to report at a meeting called for Saturday, Oct. 29, 1881, in the city of Sherman.

After the appointment of this committee, the meeting adjourned till 2 p. m., when the members reassembled, not as an association, but to discuss among themselves the different points in their profession. They had a very pleasant social meeting, and every one

in their profession. They had a very pleasant social meeting, and every one went away knowing something more of bee-culture than they did before.

W. A. ROBINSON, Sec.

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Wis., Nov. 30, 1881.

N. E. FRANCE. Sec., Platteville, Wis.

The Michigan State Bee-Keep-rs' Association, will convene at Battle Creek, on Thursday, Dec. the Creek, on Thursday, Dec. 8, 1881. We have reason to expect one of the largest and most interesting meetings we have ever held. Let all arrange to be present. All District Associations should send delegates. Each person should come with their best experience in their hands, ready to hand it to the them. it over to the others of the fraternity. It is hoped that all will bring the fullest report possible from their region. Commutation rates are expected on railroads.

A. J. Cook, Pres.

T. F. BINGHAM, Sec.

the apiarists of the vicinity, as well as from other States, are cordially invited.

A. J. Adkison.

Goldenrods as Honey Plants.—I send a specimen of a weed that I wish to know the name of, and which is the know the name of, and which is the main source of late honey here. It is almost frost and drouth-proof, blooms from the latter part of September until some time in November. My bees, which had scarcely a drop of honey to days ago, have tilled their hives and are legining to can the honey, which are beginning to cap the honey, which is almost all from this bloom. The plant grows on bottom lands, and attains a height of from 18 to 24 inches, tains a neight of from 18 to 24 menes, and in some places forms a beautiful sea of golden yellow.

NOAH DEATON,
Carthage, N. C., Oct. 10, 1881.

[The specimen sent is a Solidago (goldenrod). There are several varieties, and all are excellent honey plants.

Feeding Bees.—I had 8 colonies in the spring, have now 23; have taken 303 lbs. of comb honey in prize boxes. The season was pretty good for a short time, but we have had such a severe drouth that bees have been doing no good for over 2 months. I fear many of them will starve to death unless fed pretty liberally. I brought home 100 pounds of granulated sugar yesterday, made some syrup and fed on tables 2 made some syrup and fed on tables 2 or 3 rods from the hives. In a short time there were thousands of bees at work at it, and some of them stayed with it all night, and they are at work at it yet, although it is sprinkling rain, and it is now 4 o'clock. Will this way of feeding do? JOEL BREMER. Lincolnville, Ind., Sept. 23, 1881.

[It is not a good way to feed-1. Because it incites to robbing; 2. If there are other bees in the neighborhood, you feed those as well as your own; 3. You lose many bees by the fighting and besmearing which will more or less prevail. Feed inside, or at the entrance at night, being careful to avoid daubing the hive .-- ED.]

Moving Bees. - I have 13 colonies of bees about half a mile from home; will it do to move them? I am afraid they will return fo the old place. Answer in the BEE JOURNAL. W. P. BOND. Quiet Dell, W. Va., Oct. 14, 1881.

[You can move them any time, and any distance. After the removal is made, let the hives remain closed till about noon, then slant a board in front to partially obstruct the entrance, and release the bees. Let the boards remain a few days. The above will also answer the query of J. C. Burns, Terre Haute, Ind. Of course, such weather must be selected as will allow the bees a good flight soon after moving-ED.]

Two Queens in one Hive .- One evening in August, I was viewing one of my colonies through the observation fine young gueen crawl around the end of a frame. In a day or two 1 opened the hive to examine my young opened the five to examine my young queen. On the third frame was the cell from which she had emerged perhaps a week ago. On the lifth frame was the old queen all right and lively. I closed the hive and concluded she I closed the hive and concluded she had dispatched her daughter. About a week later, a friend paid me a visit, and, as he had never seen a queen, I opened the same hive. On the second frame was my young queen. I removed 7 frames (leaving 2) looking for the old queen, and, not finding her, I closed the hive, thinking now that she was dead. A few days later a neighbor called, and I opened the hive again to show him the young queen, when I was astonished to find both old and young on different frames. To-day I made another or both old and young on different frames. To-day I made another ex-

amination, and found both on the amination, and found both on the same frame not more than 2½ inches apart, both lively, and I discovered that my young queen has mismated, there being quite a number of hybrids about. I have a notion to pinch her head right away. Will it be right or head right away. Will it be right or wrong? The old queen I purchased in 1879, of D. A. Pike. She is nice and prolific, and her workers are good honey gatherers. W. R. Young. Myersville, Md., Sept. 25, 1881.

If you do not want hybrids, you had better not keep the mismated queen, unless her mother is too old for wintering, or you can give the colony another in its place.—ED.]

Deep Frames for Winter.—I have kept and handled bees for upwards of 50 years; during this time I have had 50 years; during this time I have had almost all kinds of hives that were invented. For many years the only hives we used were the upright, square box, about 1s inches high, and the straw basket, and fire and brimstone were the only mediums through which to obtain the honey. While using these hives we knew nothing of winter killing or spring dwindling. I now use none but the Langstroth hives. I prefer it on account of its convenience in manipulating bees and small honey boxes. Last fall I had still one of the old boxes, with an old colony, and old black combs. Thinking it almost worthless I put it in the cellar without any attention, while ing it almost worthless I put it in the cellar without any attention, while those in Langstroth hives, all in good condition, had the best of care. The result was in the spring that all the bees in Langstroth hives were dead but one, and it very poor. Those in the old box-hive were as good as in the fall. This experience led me to the conclusion that a higher box than the Langstroth would be preferable for our climate to winter bees, I accordingly made a hive, a model of for our climate to winter bees, I accordingly made a hive, a model of which I send you by mail to-day. The proportions of the model are not correct, it is too high. The small board in front is the middle of the box. The box inside is 10x13 inches and high enough to use the Langstroth frame enough to use the Langstroth frame placed in on the end as you see in the model. Here we have the Langstroth frame, the 2-lb. honey boxes, 12 in number, the same freedom of manipulating, and the old upright box all combined. I have also an additional entrance over the small board in front with a slide over for closing. What is your opinion about the box? Bees did pretty well with us this summer.

D. LANTZ.

Forreston, Ill., Sept. 29, 1881.

[We do not think you will long be satisfied with your new hive. The extra depth of frame will make it very inconvenient to manipulate, and we doubt its immunity from loss in wintering. Certainly, last winter's experience was no guaranty of success for the "old box hive."—ED.]

My Coming Bees.—Considerable is written about the coming bee; I have a whole hive full of them. I was at work with them a short time ago, when work with them a short time ago, when one of my neighbors came into the yard and took a position about 10 feet in front of the hive. I told him he would feel better to stand back of the hive with me; "Oh," said he, "bees never sting me;" just then one took him on the end of his nose, and the last I saw of him he turned around the corner of the house, with tears running from both eyes arms strathed. running from both eyes, arms stretched full length, as he exclaimed, "Halle-lujah! blast your gol darned bees!" These bees are little black fellows, and · Halle-1 took 48 1-pound sections from them.

JAMES RONIAN.

Villisca, Iowa, Oct. 11, 1881.

The Western Michigan Bee-Keepers' Association will meet in Berlin, Ottawa, Co., Mich., Thursday, Oct. 27, 1881, in Huntley's Hall, at 10:30 a. m. All interested are cordially invited. WM. M. S. DODGE, Sec. Coopersville, Mich., Aug. 29, 1881.

# Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Advertisements intended for the Ber Journal must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the old as well as the new address.

Those who may wish to change from other editions to the Weekly,can do so by paying the difference.

Constitutions and By-Laws for Constitutions \$2.00 per 100. The local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Deserving Articles are Always Appreciated.—The exceptional cleanliness of Parker's Hair Balsam makes it popular. Gray hairs are impossible with its occasional use. 40w4t

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents to pay. except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Mannal, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the JOURNAL for a year free. It will pay to devote a few hours to the BEE JOURNAL.

It is the Height of Folly to wait until you are in bed with disease you may not get over for months, when you can be cured during the early symptoms by Parker's Ginger Tonic. We have known the sickest families made the healthiest by a timely use of this pure medicine.—Observer. 40w4t

It would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office. County or State.— Also, if you live near one postoffice and get your mair at another, be sure to give the address we have on our list.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums:

For a Club of 2,—a copy of "Bees and Honey.

" 3,—an Emerson Binder for 1882.

" 4,—Cook's (Bee) Manual, paper, cloth 6.—Weekly Bee Journal for 1 year.

We have a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, ) Monday, 10 n, m., Oct. 24, 1881.

The following are the latest quotations for honey and beeswax received up to this hour:

#### CHICAGO.

HONEY The market is lively and prices steady. We quote light comb honey, in single comb oxes, 180,20c; in larger boxes 2c, less. Extracted

BEESWAX - Prime quality, 18@22c. Al., H. NEWMAN, 972 W. Madison St.

#### CLEVELAND.

HONEY There is a slight improvement in our market for comb honey. One pound unglassed sections find rendy sale at 21c, for white, and 20c, for 2 b, sections. Extracted honey continues dull

t 106#12c, BEESWAX-200#22c, A. C. KENDEL, 115 Ontario Street.

#### NEW YORK.

HONEY.—The advices give a middling fair crop of honey. Moderate lots have arrived, but the demand so far has been very slow, and but little improvement can be expected until we have cooler wetter, where there is not not sometiment of the cooler wetter, the cooler with the cooler with the cooler wetter, white, Howatte, it small boxes, 150-17e. Extracted, white, 100-11e.; dark, 7649e.

BEESWAX.—Prime quality, 245-2623e.
THORN & CO., 11 and 13 Devoe avenue.

#### CINCINNATI.

HONEY-Is in good demand here now. I quote: Good comb honey, in sections, is worth 186020c, on arrival. Extracted, 760c. on arrival. BEESWAX.—186020c, on arrival. I have paid 20c, per lb. for choice lots. C. F. MUTH.

#### BOSTON.

HONEY.—1-pound combs are a destrable pack-ge in our market, and a large quantity could be old at 20022c., according to quality. BEESWAX—Prime quality, 25c. CROCKER & BLAKE, 5 Chatham Street.

#### BALTIMORE.

HONEY.-But little on the market, and prices are not quoted.

BEESWAX.-Southern, pure, 21@23c.; Western, pure, 21@ 22c.; grease wax, 11c.-Bultimore Market Journal.

#### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb. sections, 20@25c.~ Indianapolis Stock Review.

#### SAN FRANCISCO.

#### ST. LOUIS.

HONEY. In fair request. Strained, Sc.; ex-racted, Sc.; comb, 16selse-latter for bright, BEESWAX - Prime yellow selfs at 18selse, R. C. Gueer & Co., 117 N. Main Street.

#### PHILADELPHIA.

HONEY,-The supply and demand are alike nommal. BEESWAX — Best light 23@25e.—Philadelphia Merchants' Guide.

# The Bee-Keeper's Guide;

## MANUAL OF THE APIARY, By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College ef Michigan.

320 Pages; 133 Fine Illustrations

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly dinstrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient, study and perproduced with great care, patient study and per-sistent research. It comprises a full defineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings -the products of the Honey Bee; the races of bees; full desceriptions of honey producing plants, trees, shrinls, etc., splendully illustrated—and last, though not least, detailed instructions for the various

not least, defined instructions for the various manipulations necessary in the apairy.

This work is a masterly production, and one that no bee-keeper, however limited his means, can abord to do without. It is fully 'my with the times' on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book:

All agree that it is the work of a master and of real value. -L'Apiculture, Paris.

I think Cook's Manual is the best of our American works. LEWIS T. COLBY.

can works.—LEWIS T. COLBY.

It appears to have cut the ground from under future book makers.—British Ber Journal.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the aphary.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. 11. WYNKOOP.

Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—Mich. Far.

Is a musterly production, and one that no beekeeper, however limited his means, can afford to do without.—Ncbroska Farmer.

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—A. E. WEXZEL.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual It is the latest book on the bee, and treats of both.

ual.—WM. VAN ANTWERP, M. D.
It is the latest book on the bee, and treats of both
the bee and hives, with their implements. It is of
value to all bee-raisers.—Ky. Live Stock Record.
It is a credit to the author as well the publisher.
I have never set met with a work, either French
or foreign, which I hike so much.—L'ABBE DI'
Bots, editor of the Balletin D' Apiculieur, France.

Bors, editor of the Bulletin II Apiculteur, France, It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of those producing plants, and an extended account of the enemies of bees.—Itemocrat, Pulnski, N. Y. We have permsed with great pleasure this reademic most of the beet information on everything belonging to apiculture.—To all taking an interest in this subject, we say, obtain this valuable work, rend it carefully and practice as advised.—Agriculturist, Quebec.

This book is promanged by the press and leading.

best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valumble work, rend it carciuliy and practice as advised.—Agriculturist, Quebec.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amneture in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—Western Agriculturist.

This work is undoubtedly the most complete manual for the mistraction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left unmouehed, and in the complation of the work Prof. Cook has had the advantage of all the previous knowlede of a pairists, which he uses admirably to promote and make popular this most interesting of allocampations.—American Inventor—1t may safely be pronounced the most complete and comprehensive of the everal manuals which have recently appeared on the subject of bees and their handling in apairies. The studies of the structure of the bee, the different varieties, the various bee products, and following these the points of management, extending to the smallest details, are all of high and practical value. Prof. Cook has presented the latest phases of progressive bee-keeping, and writes of the themes discussed in the light of his own experience.—Pucific Rural.

Of the many excellent works which we have examined on bee-culture, we consider Prof. Cook's the most valumble for the study of those who contemplate going into the business or are already keeping bees. If thoroughly studied, and lateachings conformed to, by the apairst, who exercises a reasonable degree of enhancism which carries the reader with him to the end.—Konsos Farmer.

Cook's Manual of the Aplany holds in America the same high rank, tha

# POPULAR HONEY KEGS

Small Kegs for Honey.

50 lb.	Kegs.	each						,	,			,85c
100 lb.	Kegs.	1.6										.55e
140.115		4.6										650

These kegs answer the popular demand for honey in small packages, and when compared with large barrels holding from 300 to 500 lbs. each, they are fully as cheap and often cheaper. They need no waxing but should simply be thoroughly scalded with boiling water before using. The leakage so often occurring in the large hard-wood barrels can be entirely prevented by using the White Pine Kegs, Considering the cost and trouble of waxing, the loss of honey by leakage, and the ease with which these kegs can be handled and shipped, with an actual saving in original cost, it must be apparent to all that they are the best.

#### Dr. J. P. H. Brown's Address.

For several weeks we have been obliged to delay the publication of Dr. J. P. H. Brown's address before the National Convention at Lexington. owing to its length, but not one paragraph or sentence could we omit. We give it this week in its entirety, on page 347, and bespeak for it a careful perusal.

The Doctor ranks high in his scientific attainments, and has spent much of the past season in practical experiments. It will be observed he inclines to the opinion that the Syrians are the progenitors of the yellow species, in which, we believe, he agrees with Prof. Cook, and which opinion we long have held. Particularly gratifying is the result of his measurement of the tongues of the different races, proving conclusively that we were correct in our repeated assumptions of the improvement of the Italian bees in America, and Italian bee-masters acknowledge that we have not permitted any deterioration. In view of what has been accomplished in this line, what a field is opened to our careful breeders to engraft upon our best bees the desirable traits of the newer races, if they possess any. Italy and all Europe look to America for the coming bee-let us not disappoint them.

While calling the especial attention of all Americian apiarists to the two sponsible persons for hives or bees.

concluding paragraphs in Dr. Brown's address, we thank him for his able constructive indorsement of the utterances of the BEE JOURNAL on the same subject.

Canadian Honors.—The following letter has been duly received by the editor of the BEE JOURNAL:

T. G. NEWMAN, Esq., Chicago.

Dear Sir:—At the annual meeting of the Ontario Bee-Keepers' Association, you were, by resolution, made an honorary member of the Association. I enclose your membership ticket.
Yours Respectfully,
R. McKnight, Sec.

The ticket was accompanied by a very neat and attractive copy of the "Constitution and By-Laws," with the list of officers for the present year. It is needless to say that we appreciate the compliment. The tasteful appearance of both the Constitution and member's ticket bespeak great credit for the efficient Hon. Sec., R. Mc-Knight, Esq.

The Texas State Bee-Keepers' Convention will be held at McKinney. Texas, on Tuesday, April 25, 1882.

The editor of the South and West is being imposed upon by Lizzie E. Cotton, who is endeavoring to work upon bee-keepers, by giving tlattering yields of honey with her "new system of bee management," and "controlable hive." After the hundreds of persons who have reported that they have sent her money and get no returns, it seems strange that any one should be deceived by her advertisements. She promises to use the South and West to give further reports. If that paper will thus freely give them, after she has been refused advertising space in all the respectable journals of the country, it must be totally in the dark about the matter. We hope, however, that the South and West will not so impose upon its readers, after this warning. We have no interest in any hive, and only point this out to our cotemporary, in justice to it and its patrons. In many localities the present season has been exceptionally good for honey production, and large yields are reported in almost every kind of hive. Such, therefore, should be credited to the locality or season, or both, and not to any form of hive, and there is no necessity for any one to be deceived by such statements, and inveigled into sending money to irre-

The Drouth in Europe. - The excessive heat and drouth of the past summer has caused a shortage of onefourth on the crops in Europe, including the honey crop. France will have to import over fifty millions of bushels of wheat to supply her home consumption. England, Austria and Germany also report a shortage. Hay is so short in Germany as to cause much anxiety, and Consul Warner writes concerning it as follows to the State department at Washington:

On information derived from a very good source, it was ascertained that the present prices for hay are double those of last year. It would be unfortunate for the wretchedly poor laboring class in Germany if anything like a failure in crops should happen that is now predicted. In my opinion, it would be the cause of greatly increasing the tide of emigration to America, the land that has an attraction surprisingly wonderful for the German peasant. Their sole ambition seems to be turned in the direction toward America. Even the old and infirm become comparatively younger whenever America is talked about in their presence, and they are told of the abundance of breadstuffs that is to be had there. On information derived from a very be had there.

Old Combs. - We see the following item going the rounds of the agricultural papers:

Old combs can be nicely cleaned by pouring water over them and throw ng it out with the extractor; pare off the moldy part with a knife.

Such advice is too antiquated-it might have passed ten years ago, but will not do now. Better to melt up the old combs and give the bees comb foundation. It will pay better than to fuss with any "old comb" remedy, particularily if it is moldy.

Mr. S. D. Buel's crate for honey. on exhibition at the Chicago Convention last week, is now in our museum. See its description on page 350 of this JOURNAL.

"I would not have missed attending the Chicago Convention for \$20; the discussions were so very instructive." So said one who visited our office four days after the Convention closed. Such discussions are very interesting, and in some respects the late Chicago Convention was a model

It will pay to devote a few hours in getting up a club for the BEE JOUR-NAL. Read the list of premiums on another page, and take advantage of the fall gatherings to get up clubs.

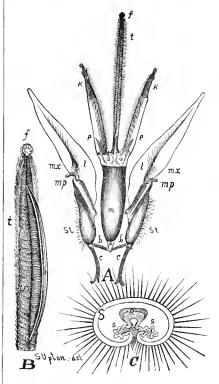

Read before the Association for the Advancement of Science, at Cincinnati, O.

### How the Bee Extends its Tongue.

PROF. A. J. COOK.

The figure, from Cook's Manual of the Apiary, gives an accurate idea of the Apiary, gives an accurate mea of the structure and parts of the tongue of the honey bee. A gives the parts as they appear when extended; B shows the lighla with the tubular sheath (s) fully extended, and C shows a cross section of the lighla when the sheath is not extended. In this figure sheath is not extended. In this figure,

Tongue of the Honey Bee.

ss represents a colorless membrane, which is usually folded as seen in the figure, but which is put on the stretch, when the sheath is distended as seen in B. The central rod (r) is essentially a tube, as I showed two years since in the American Bee Journal, vol. 15, page 490; but it is slitted below, so that by the use of the muscle r, in C, the bee can open this along its whole length. This tube, and also the sheath (s) connects through the tubular mentals in the beginning and (s) connects through the tubular mentum (m in A) with the coophagus, and so with the stomach. Just at the base of the mentum, as shown by Mr. Justin Spaulding, in American Naturalist, vol. 15, page 113, this tube receives the tube from four large compound racemose glands, two of which are in the head and the others are in the thorax.

We see, then, that secretions from these glands may be poured into the tube of the central rod, or into the tutube of the central rod, or mto the tubular sheath. The tubular rod opens at the tip of the ligula (f in A), but the tubular sheath is imperforate except at its base, where it joins the tube of the mentum, and so has connection with the duct of the glands, with the sophagus, the mouth and the tube of the central rod.

When the mouth-organs are not in use, the tip of the ligula, f in A, extends only to the tip of the labial palpi, K, K in A, and all the parts, t, K, and mx, mx in A, are doubled back under the head. By the action of several pairs of muscles variously extended to the second pairs of muscles variously extended. eral pairs of muscles, variously attached to these parts and to the head, these parts are straightened, preparatory to use; then by the injection of liquid into the tubular sheath, the lig-ula is fully protruded. By holding a bee between the tingers (a bumble bee is the best), we can see the tongue vary in size as it is protruded or retracted as we offer it sweets. Of course, a good lens is necessary in this demonstration.

The source of the liquid that extends the tonge is, I think, that which comes from the glands already mentioned. If we take a dead bee that is not rigid, and whose sucking-stomach is full of honey, and press on the abdomen, the nectar will come forth from the mouth-

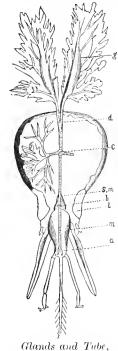

Diagram reduced from American Naturalist.

opening, and not from the end of the ligula. The sheath does not expand, and of course the ligula is not pushed out. But if we press on the mentum, either when the stomach is empty or when it is full, then the sheath is dis-tended, and the tongue is pushed out. In thus pressing the mentum of a bumble bee till the sheath was burst open. I have found that the liquid that came forth was often entirely without sweet taste. Therefore, unless it came from the salivary glands, it must have come from the glands described above. It is hardly supposable that the mu-It is hardly supposable that the nuncous from the tube would be sufficient. Again, it is just as necessary for the tongue to be thrust out—yes, and more necessary—when the sucking-stomach is empty, as when it is full. But if nectar from the stomach is what is need, how would the bee extend the tongue when the sucking-stomach was empty? The enlarged ducts from the gtands would, on the other hand, always have the material ready to effect

this important purpose.
It has been suggested that the secretion from these glands is used to change the nectar into honey, or in

referred to perform this function, they must be carried down with the honey. Thus, they would perform two functions, one a physical and the other a chemical. This is thought to be true of our own saliva, by many physiologists. It certainly aids in comminuting the food, and many think that it aids in transforming the starch of the aids in transforming the starch of the food into grape sugar. Lausing, Mich., Aug. 18, 1881.

For the American Bee Journal.

#### How I Winter Bees Successfully.

G. W. ZIMMERMAN.

After 29 years' experience with the movable comb bee-hive, my success has depended on judgment as regards the winter, whether mild or severely cold for a long time, and the condition 1 find my bees in. First, how to prepare them for winter, and the treatprepare them for winter, and the treat-ment thereafter. There has been so much written on this point, I will only say see that each colony has 20 to 25 pounds of honey in September— whether gathered early or late makes no difference, so it is ripe, with proper winter passages through the combs. I regard it as essential, when the bees are having their last flights in the full i regard it as essential, when the bees are having their last flights in the fall, to remove the cloth or honey board and place two sticks across the frames, then a piece of coffee sacking single or double: lay thereon two very dry bricks, not too hard burned; now I use clover-chaff, sawdust, fine straw and torest leaves well mixed together, with which I cover the sacking and with which I cover the sacking and brick 4 inches deep. This will absorb all the moisture arising from the bees. Thus treated, we will hear no more Thus treated, we will hear no more about taking out the top packing, drying it, and putting it back again. The above preparation will do for in or out-door wintering.

I have tried the following experiment several times, with success in in saving my bees: A few years ago the bees were nearly all dying off with dysentery in this neighborhood. Lev-

dysentery in this neighborhood. Lex-amined my 65 colonies in the house, and found nearly all uneasy, very wet, and bodies distended. I procured a stove, set it up in the house, and removed the top cloth and front block, and heated the room quite warm. All the bees that were affected with dysentery came out all over the hives. It done this twice, from evening till midoff, and clustered quietly back in their hives again. They had discharged their feces, coming out and going back. The result was, I saved all but two queens. I will practice this again if any become uneasy, and give the resuit in the spring.

Napoleon, O., Öctober 8, 1881.

For the American Bee Journal. My Honey Report for 1881.

G. M. DOOLITTLE,

By turning to page 217 of the BEE JOURNAL for 1881, the reader will find that my bees were united down to 30 colonies, to get them in shape so I could reasonably expect a profit from them; and how it was so wet and cold up to the 27th of June that the bees could do but little on white clover, as

could do but little on white clover, as well as a full report of my apiary up to that time.

On June 20th the weather became favorable, and the bees went to work in earnest on the remaining clover so as to store a little surplus. Basswood bloom opened July 8, and 1 expected to see a "rush" made for it by the bees, as usual; but to my disappointment, there seemed to be but little honey in it, and when the end came my hopes were nearly blasted, for I had taken scarcely a box of honey up to this time. Basswood is generally to this time. Basswood is generally my main dependence for a honey crop, to has been suggested that the secre-tion from these glands is used to change the nectar into honey, or in ease the bees are fed cane sugar, to change a part of the cane sugar to change a part of the cane sugar to change sugar. That such a change is brought about is certain, but it is done in the stomach, and if the secretions

Red clover has not blossomed with us for several years past, on account of a worm working in the head, and I was quite a little surprised, along the latter part of basswood, to see fields of the large kind growing red with blosthe large kind growing red with blossoms. As the fields became redder, I hoped the bees might yet store some from this source, but did not expect such a yield as was finally obtained. Teasel was also now in full bloom, and the few acres that were within the range of my bees' flight commenced to yield abundantly. The combs in the boxes commenced to grow as if by magic, and the bees poured out for the clover and teasel fields in about equal proportions, working from early morn till late at night. Thus 10 days were passed, when the yield gradually drew to a close, terminating about the first passed, when the yield gradually drew to a close, terminating about the first of August. Acres of buckwheat soon began to be white, but day after day passed and no yield from that source. Thus the season for 1881 was ended Four years have now passed since bees in this locality have stored a sur-plus from buckwheat, so that with me a honey yield is the exception, rather a honey yield is the exception rather than the rule.

As a result of my season's work I have to report: comb honey, 3,317 lbs., and 718 of extracted, giving a total of 4.035 lbs., or 134½ lbs. to the colony for an average. The 30 were increased to 80, which are in good condition for winter. When spring opened I only had one really good colony, and this I concluded to work for extracted honey.

had one really good colony, and this I concluded to work for extracted honey. I will give the result, so the reader may know the amount of honey gathered from the different sources: Willow, 5½ lbs.; apple, 19½ lbs.; white clover, 58½ lbs., basswood, 97 lbs.; red clover and teasel, 232 lbs.; making a total of 412 lbs. I have also reared and sent out \$3 tested queens the past season, which, of course, quite materially lessened the yield of honey.

I worked an apiary of 15 colonies away from home, and from this I obtained \$74 lbs. of box honey, and 1,400 lbs. of extracted, giving a total of 2,274 lbs., or 151½ lbs. per colony.

Nine years ago I commenced to keep a correct account with the apiary, and I find, by looking over said account, that the average yield of honey per colony for the last 9 years foots up 92 pounds for each year. Thus, if a man keeps 100 colonies of bees, he will have 9,200 lbs. of honey for his yearly income, worth at least 15 cents per pound, giving a cash income of \$1,380. Who will say bee-keeping does not pay as well as any other pursit in life? does not pay as well as any other pursuit in life?

One result of the past season has pleased me very much, which is that nearly all our colonies of bees gave about an equal result. I have been breeding for years to see if I could not get all colonies to some up to the standard get all colonies to come up to the standard of the best, and not have one col-ony give a large yield and another nothing. When we, as aplarists of America, can so perfect our bees that all colonies shall give as good results as have been obtained by the best in the past, then there will be no need of further importation of bees, for Apis Americana will be the best bee in the

Borodino, N. Y., Oct. 18, 1881.

MISCELLANEOUS.

District Meeting in Indiana.-The Indiana Farmer gives the following notice:

As will be seen by the notice given As will be seen by the notice given last week, Mr. Charles Schofield, Vice President of the State Bee-Keepers' Association for this district, has called Association for tins district, has caned a meeting of the bee-keepers of Marion and adjoining counties, to meet on Saturday, Nov. 5, for the purpose of organizing a local Bee-Keepers' Society. There is quite a large number of bee-keepers within the territory embraced in the call, and there is no reason why we should not have a good, strong local association. There is no question as to the benefit to be derived by societies of this kind, and we hope there will be interest enough shown to make the meeting a success.

A Fierce Combat.—The Louisville Home Journal of last week tells the following little story concerning the fighting qualities of the Cyprian bees:

A devotee of apiculture within hear-A devotee of apiculture within hearing of the bells of Eminence, Ky., procured a colony of Cyprians, of which he was very proud. But one day his pets became excited, and made a vignormatical control of the colonial control of the colonial colonia orous attack upon their master. treating to the house, he put on his yeil and gloves, tied strings around the ankles of his pants, and went out with smoker, etc., determined to tame them. He forgot, however, a small hole in the crown of his bat, and in an noise in the crown of his hat, and man immentionable part of his pants, of which, after the regulation amount of smoking, about 20 vigorous bees in the hat, and as many in the pantaloons, reminded him most forcibly. The bee master retreated, still lighting for mastery. The battle lasted all day. mastery. The battle lasted all day. The master was forced to run over into another county. Every hand on the place was routed; the horses and cattle were stampeded; dogs and cats were driven into the brush; the poultry came next, and bolted for the woods; sitting hens and ducks were driven from their nexts, and night at driven from their nests, and night at last put an end to the conflict. The bee master did not attend the Bee Convention last week, but there is no need to ask why.

Good Blood Tells .- The Cincinnati Grange Bulletin, very aptly puts it

It is needless to recommend to the It is needless to recommend to the bee-keeper who gets the best blood in his barn, to also keep good blood in his hives. Blood pays in all cases, and if our farm would flow with "milk and honey," we must adopt the best breeds and best appliances. The prime object in making a bee farm, is to provide pasturage at a time when the bees depend got honey from what is termed. do not get honey from what is termed, "natural sources." The first thing our bees want in spring is pollen, and we can imagine with what admiration the first pollen-ladened bee is greeted as it enters the hive.

As we have so often asserted, "best bees" and "best pasturage" are the "winning eards." We are glad to see our position on them so generally en-

Bee Pasturage. Our Home and Science Gossip records itself as follows:

Among our valuable bee-exchanges, we include the American Bee Journal, Chicago, Ill., an eight-page weekly, which is the largest paper we receive devoted exclusively to bee culture. In the number for Sept. 28, Dr. Tinker speaks very highly of what he terms the "golden honey plant," and claims for it the prestige of eclipsing all the August and September honey-producing plants, while Mr. T. G. Newman, the editor of this valuable paper, says "every bee-keeper should lend encouragement to the developing of new honey plants, as sometimes the more popular varieties are not suited to all climates and soils." We deem this very sensible advice, Among our valuable bee-exchanges. We deem this very sensible advice, and hope all our bee-keeping readers will take pains to heed it:

The Marshall County Bee-Keepers' Association will meet at Marshall-town, lowa, Saturday, Nov. 5, 1881, at 1 p. m., in Judge Bradley's rooms, Woodberry Block. Subject for dis-cussion, Wintering. J. W. SANDERS. Le Grand, Iowa, Oct. 25, 1881.

Read in the National Convention.

The Different Races of Honey Bees, and their Geographical Distribution.

DR. J. P. H. BROWN.

The bee bears the same relation to the other orders of insects, that the Cancasian race bears to the other races of mankind; it is the highest type of insectian form and development. Endowed with instinct, and which is the arrangements only

other orders of insects, that the Cancasian race bears to the other races of mankind; it is the highest type of insectian form and development. Endowed with instinct, and "a kind of reason, differing, perhaps, only in degree from that of man, these insects out-rank all other articulates." In the fossiliferous history of our earth, the bee does not date tar back, but is the last to appear upon the earth's surface.

This insect has been placed by entomologists in the order Hymenoptera family Apiarise of Latreille, genus apis. The genus is subdivided into various species; probably not more than seven or eight. Some of the old writers have enumerated many species under the generic name "apis," regardless whether they belonged to the social or solitary group.

The species "apis melifica," which is our domestic honey bee, is the one most generally known, and is the one to which I shall confine myself in this paper. The black or German bee, the Italian bee, the Cyprian bee, the Egyptian bee, and the Holy Land or Syrian bee, are often referred to as distinct species, but neither of these races or varieties have sufficient physical characteristics to entitle them to be so classed. The catagory of characteristics upon which species are based, embraces not only marked differences in the proportion of the parts and in the absolute size of the whole animal, but it also implies a difference in habit, and a capability of indefinitely perpetuating the characteristics of the animal by sexual reproduction.

Hybridity among species very rariely occurs; varieties, on the other hand, very easily cross, and such crosses are prolific, while true hybrids are not usually so. I use the term hybrid here in its true signification, and not in the sense in which it is commonly applied by bee-keepers.

Whether the different varieties of the honey bee originated by the tonch of the Divine hand from a common centre, or whether they emerged into existence, according to the theory of evolution, with all their distinctive peculiarities, at the lo know that when a race or variety of animals are taken from one locality into another where there is a difference in food, and different climatic agencies brought to bear upon them, that they will gradually undergo some change in their physical characteristics. As illustrations of this fact, Mr. Alfred R. Walface, anthor of "Theory of Natural Selection," has observed that butterflies, of the family "Papilion idæ," inhabiting Sumatra, Java and Borneo, are almost always smaller than the closely allied species of Celebes and the Moluccas; the species or varieties of the small Island of Amboyna, are larger than the same species or closely allied forms inhabiting the surrounding islands; the species found in Celebes possess a peculiar form of wing, quite distinct from that of the same or closely allied species of adjacent islands; and numerous species which have tailed wings in India and the western islands of the Archipelago, gradually lose the tail as we proceed eastward to New Guinea and the Pacific.

In Angora, not only goats, but shepherd dogs and cats have fine fleecy hair; the wool of sheep changes its character in the West Indies in 3 generations. M. Costa states that young oysters, taken from the coast of England and placed in the Mediterranean, at once altered their manner of growth, and formed prominent diverging rays, like those on the shells of the proper Mediterranean oyster."

We find the same law to hold good in the vegetable world. Apple trees of winter varieties taken from Northern mrseries and transplanted in the Southern States, mature their fruit early in the fall with the loss of its keeping qualities. Improved varieties of tomatoes that grow to perfection at the north, when planted in the extreme south will degenerate in a few seasons into small red halls. Some to

Mediterranean oyster."
We find the same law to hold good in the vegetable world. Apple trees of winter varieties taken from Northern nurseries and transplanted in the Southern States, mature their fruit early in the fall with the loss of its keeping qualities. In proved varieties of tomatoes that grow to perfection at the north, when planted in the extreme south will degenerate in a few seasons into small red balls. Some 10 years ago I planted for the first time the

Trinidad sweet potato, then recently imported. Then it was of globular shape, white, and rather coarse grained. The same potato now, on my grounds, under careful culture, has entirely changed its original shape and qualities. It has become obtong in shape, of yellowish color, fine grained with an abundance of saccharine matter.

original shape and qualities. It has become oblong in shape, of yellowish color, fine grained with an abundance of saccharine matter.

In commenting upon these alterations of type in vegetables and animals, the author previously quoted observes that "many of these curious modifications may, in time, be due to other causes than climate only, but they serve to show how powerfully and mysteriously local conditions affect the form and structure of both plants and animals, and they render it probable that changes of constitution are also continually produced, although we have, in the majority of cases, no means of detecting them."

Herr Vogel, a distinguished scientific apiarist of Prussia, in a paper upon the "Mixed Breeds of Bees," refers to varieties as follows: "It the bees of any particular district are distinguished by a marked propensity for swarming, or by any other special characteristics, we are warranted in designating them as a variety. Thus in my estimation, the heath bees of Luneberg, or those of lower Austria, etc., are simply new varieties of our well known black bee. The peculiar constitutional properties which characterize varieties are rooted in the physical or spiritual nature of the insect, and elicited by the kind or quality of the pasturage, by particular modes of management, by diversity of climate, or some other dominating peculiarity of the district. Accordingly, these constitutional properties disappear, or are lost by lapse of time, by removal to a different locality, and thus subjecting the insect to other climatic influences, and other conditions of management or pasturage."

Reasoning a priori, we are forced to the couclision that the Syrian, Cyprian, Egyptian, Italian and black bees are simply varieties of the species "apis melifica," and are of common origin. We are also confirmed in this conviction by their comparative characteristics to an assumption of some of the peculiarities of some other breed. This seems to be a rule attending the breeding of all cattle, horses, sheep, swine

that lack that fixedness and individuality of character sufficient to stamp such breed as a distinct species. The black bee and the Cyprian, though possessing probably more type of character than the other varieties, often sport from an exact standard, both in the queen and worker progeny. Black queens are often found as yellow as some imported Italians, and in the same apiary of blacks, the workers of one colony may be larger in size, and of a less black color than the rest. In fact, I have often seen black bees when their abdomen was distended with honey, that showed 3 bands quite as distinctly as some dark Italians. dark Italians.

anomen was distinctly as some dark Italians.

Cyprian queens come nearer duplicating themselves in appearance than any other breed, but they at times, sport. The workers generally have the yellow abdominal bands bright and distinct, with a delicate fringe of yellow hair bordering the posterior segments of the abdomen; but sometimes this hair is whitish, and the fringe heavy, with nothing to distinguish them from the Syrians and Egyptians. On the back between the articulations of the wings of the Cyprians, there is generally a tuft of bright golden yellowish hair, covering the honey shield, which is also yellow. These marks are claimed to be a distinguishing trait in their case, but if you will carefully examine your bright Italians and Syrians, you will find many bees with the same mark. I find many Syrian queens marked like the Cyprians, but then at times, we find them as dark as black queens. The same observation applies to the Egyptian queens. Italian queens, as we receive them from Italy, vary very much in appearance. While some few are bright and yellow, the majority will produce three-banded workers. I have seen, and received myself, direct from that country, some that would produce some workers that could not be distinguished from blacks.

When the mental peculiarities of these tinguished from blacks.

When the mental peculiarities of these breeds are compared, they point as unmistakably to the common origin, as do the

find the same disposition among Italians. I have had colonies of blacks to show the

find the same disposition among Italians. I have bad colonies of blacks to show the same propensity.

The mass of bee-keepers are fully acquainted with the blacks and Italians, but are unfamiliar with the Cyprians and Syrians. There seems to be great diversity of opinion in regard to the merits of these two last named varieties, which have been recently introduced. If they should add nothing to increase the honey production of our country, I regard their introduction into America as a means of throwing more light upon the natural history of the honey bee, and to those two enthusiastic beckeepers, Messrs. D. A. Jones and Frank Benton, who were the first to import these bees direct, the scientific apiarists owe a debt of gratitude that can never be paid.

Aside from the aid they have been to scientific investigation, they have qualities, which, in my opinion, can be made available in an increased production of honey. I have found the Cyprian queens wonderfully prolific, and the workers very industrious. True, they have some ugly traits of character—they are most excellent fighters when provoked, but, with a proper application of smoke and care and gentleness in opening the hive, avoiding all sudden jars, I can work among them as easily as with the Italians. During the past season I have found that in a few generations they lose, to a very great degree, their fiery temperament, and become more like the Italians in disposition.

Of late years much attention has been paid to secure bees with long tongues, and the microscope has been brought into requisition to determine their length. The major portion of all such experiments signally fail to give satisfactorily results, from the fact that the observations are either made upon dead muscle, or when the muscles of the tongue are in a passive condition. The length may thus be correctly determined, but it fails to give the degree of working capacity of this organ when in a "state of action." Therefore, only such experiments that seek to meas-

degree of working capacity of this organ when in a "state of action." Therefore, only such experiments that seek to meas-ure the distance the tongue of the living bee can pass down the corolla of the bee can pass down the corolla of the flower, will prove of any advantage to bee

flower, will prove of any advantage to bekeepers.

In order to secure some definite results in this matter, I have constructed a small instrument which I call (for the want of a better name) a linguameter. This instrument contains a cup to hold diluted honey, a float, and a dial of 32ds of an inch. The bee's tongue passes down to the food through meshes of ½ of an inch, formed by very fine wire. As the honey in the cup is taken up, the float descends, and marks the distance on the dial. It is not claimed for this instrument to give the actual length of the tongue, only its reaching capacity through a given sized aperture. Six colonies each of black bees, imported Italiaus, home-bred Italians and Cyprians were tested with this instrument with the following result:

The blacks aggregated 42-32 inches; two colonies reached 6½-32 each; three, 7-32 each, and one went 8-32. The imported Italians aggregated 45-32; three colonies went 7-32 each, and three 8-32 each. My home-bred Italians summed 48-32; one colony reached 7-32; three colonies 8-32 each, and two went 8½-32 each. One colony reached 49-32; tour reached 8-32 each, and two went 8½-32 each. One colony of Syrians (queen from Mr. Jones) was tested with a result of 8-32.

While these experiments do not show as great a difference in the reaching capacity

While these experiments do not show as

while these experiments do not show as great a difference in the reaching capacity of the tongues of these varieties of bees as many persons might suppose, they demonstrate the fact, other conditions being the same, that the Cyprians and Italians have the ability to collect the most honey. During the past season, with me, the Cyprians have been ahead as honey gatherers, the Italians next.

In the geographical distribution of the yellow varieties of apis melifica, we find them all to be confined to certain districts lying between the 24th and 46th degrees of north latitude of the eastern hemisphere. If we look for these districts or sections of country upon the map, we will find them to be generally isolated, and hemmed in by water, desert or mountains, which would make communication with outside countries dangerons and difficult for the migration of insects. We also find that these countries or districts do not generally abound in a great abundance of honey producing plants, that in some seasons honey is scarce, and great exertion is required in order to get a subsistence. We also further find, as the country becomes more expansive, more easy of access, with a greater honey-producing flora, that the yellow bee gradually becomes emerged into the black hee, and thus we find this variety common in every portion of Europe, excepting a very small part of Switzerland, the major portion of Italy, and the whole of Greece.

Egypt, no dombt, was one of the first countries after Palestine that was populated by both man and the honey bee. Com-

mercial relations were early established between these two countries. In the book of Genesis, we are told that Jacob sent his sons down into Egypt to buy corn, and ordered them to take along a little koney. As there was a trade in honey, it is safe to infer that there was a knowledge of the insect that gathered the honey. In this circumscribed country, bounded to within some 80 miles on the east by the Red Sea, on the south by the Nubian desert, on the west by Libyan desert, and on the north by the Mediterranean Sea, the Palestine bee was modified in characteristics by the different pasturage and influences brought to bear upon it.

by the Mediterranean Sea, the transme bee was modified in characteristics by the different pasturage and influences brought to bear upon it.

We are told by ancient history, that the honey bee was first carried from Egypt into Greece by Cadmus. Here, attention was paid to its culture; the learned scientists of those days spent years in studying its economy, and volumes were written describing its natural history. Honey and wax became a large article of traffic. Here, climatic agencies and other influences brought to bear upon it through long ages, changed its Egyptian peculiarities.

This modified bee was carried by the Romans into Italy, and in the most isolated districts of that country maintained, with possibly some modification of type, its characteristics. The best marked Italians are found in the northern provencies, The yellow bees, most likely of Egyptian origin, are found in the northern part of Africa, in those countries bordering the Mediterranean, and in Nubia.

Cyprians, beyond doubt, are descendants of the Syrians, modified and changed by isolation on the Island of Cyprus, which is located in the eastern portion of the Mediterranean, some 80 miles from Palestine.

The black or German bee has spread with European emigration into nearly every portion of the world. It was introduced, it is believed, into Peunsylvania from Germany about the year 1627, and was transported to South America in 1845. It can now be found in South Africa, West Indies, Sandwich Islands, New Zealand and Australia.

As the black bee is so widely scattered, placed under so many climatic influences.

Was transported to South America in 1845. It can now be found in South Africa, West Indies, Sandwich Islands, New Zealand and Australia.

As the black bee is so widely scattered, placed under so many climatic influences, and subjected to such a diversity of forage, it would be most desirable to secure specimens from all the extreme parts for comparison. Such comparison and examination might throw further light upon the mysterious process of modification of characteristics; for with all our study of the nativity and history of the honey bee, there will always be left something still for future study.

In conclusion, I will observe that in my judgment, if the ideal bee "apis Americana" is ever materialized, it can only be accomplished by a rigid system of eclectic breeding of the varieties of apis melifica now at our command. To make such breeding a success, we must have a standard of attainment to govern it. Without such standard, the breeder would be no better than a blind man groping his way in the dark. Science, intelligence, good sense, order, system, and never failing industry must play prime factors. The breeding stock, both male and female, must be selected with the best of judgment; the queen cells must be developed under the very best possible conditions, not in a little 5x6 inch nuclei with a handful of bees, but in colonies with not less than several quarts of bees of the right age to do such work. Every under-sized

ful of bees, but in colonies with not less than several quarts of bees of the right age to do such work. Every under-sized and defective cell should be rejected.

The bee-keeper who seeks to grasp this ideal bee by his own culture, must take no stock in the absurd doctrine of the "survival of the fittest." Your improved breeds of horses, your short-horned cattle, your fine breeds of sheep and hogs, your fancy breeds of poultry, were never brought about by the "survival of the fittest," and they allowed to "paddle their own cance." What has been done by stock breeders has been accomplished by a most careful system of selection and management, backed by untiring industry and perseverance. by untiring industry and perseverance.

The Michigan State Bee-Keepers' Association, will convene at Bat-tle Creek, on Thursday, Dec. 8, 1881. We have reason to expect one of the largest and most interesting meetings we have ever held. Let all arrange to be present. All District Associa-tions should send delegates. Each per-son should come with their best exson should come with their best experience in their hands, ready to hand it over to the others of the fraternity. Commutation rates are expected on railroads.

A. J. Cook, Pres.
T. F. BINGHAM, Sec.

A meeting will be held at Winterset, lowa, on Thursday, Nov. 3, ISS1, to organize a District Convention. All the apiarists of the vicinity, as well as from other States, are cordially invited.

A. J. Addison,

#### Northwestern District Convention.

The Northwestern District Keepers' met in Convention at the Bee Journal office, in Chicago, on Tuesday, Oct. 25, at 2 o'clock p. m., Dr. C. C. Miller, President, in the chair.

The minutes of the last session were

read and approved.

The Treasurer's report was submitted and accepted.

mitted and accepted.

New members were enrolled and annual dues paid.

Election of officers being in order, Mr. Ira G. Bull and Dr. Haskin were appointed tellers. Dr. C. C. Miller, receiving a majority of all the votes cast, was declared duly elected.

F. W. Chapman was elected Vice President

President.

C. C. Coffinberry was re-elected Secretary, and T. G. Newman was re-elected Treasurer.

The Executive Committee were in structed to call the next annual meet-ing of the Society to take place on Wednesday and Thursday, during the last week of the Exposition.
T. G. Newman offered the following

resolution, which was adopted unani-

mensiv:

Resolved, That the North American Ree-Keepers Bee-Keepers' Society be invited to meet with the Northwestern District Society in annual consolidated session Chicago, during the Exposition, in the fall of 1883.

#### Best Race of Bees.

Mr. F. W. Chapman has Cyprian bees, but cannot speak favorably of them as better honey gatherers than the Italians. They are not so desirathe Italians. They are not so desirable in point of disposition, but they may develop some superior traits. Has not tried the Syrian bees.

Mr. George Thompson has found the Cyprian bees a little more irritable than the Italian bees; he thinks they are earlier and later breeders, and hence thinks they are a desirable acquisition, if for no other purpose. He

quisition, if for no other purpose. He thinks they may be crossed with Italians to some advantage.

Mr. II. W. Funk finds Syrians more nervous and irritable than the Italians, but thinks they are not more liable to sting, if handled with care and nerve.

Mr. T. G. Newman: the Cyprians and Syrians have been in the BEE JOURNAL apiary less than one full season, which is not sufficient time to test them for points of superiority or inferiority. inferiority.

#### Queen Rearing.

Mr. L. C. Wemple inquired if, to rear queens, a division of the colony

would not produce good ones.

Decided in the affirmative, if the young bees were left in the queenless

Question: Will queen cells left in the hive after a swarm has emerged, produce better queens than those eared in a hive made queenless? De-

cided there was no preference.

Mr. C. W. McKown stated he had lost about 50 per cent. of the young queens he had reared this season.

Why is it?

President Miller thinks much loss is occasioned by a sameness in hives in position and appearance, and by plac-ing them in rows at regular intervals. He reverses the entrances of his hive containing virgin queens, and with good effect.

Mr. L. H. Scudder said he had heard Mr. L. H. Schaeer said he had heard the loss of young queens attributed to the birds. His nuclei are placed in the orchard, and he has never had bet-ter success with queen-rearing and mating than this season, and the birds have never been more numerous in the orchard.

Mr. Funk but seldom loses queens from his fertilizing nuclei; he has them sitting around wherever most

convenient.

Mr. Thompson lost about 65 out of Aff. Thompson tost about on our of a hundred young queens early in the season, when birds were most numerous; but later, when the birds were not so plenty, he has had comparatively good success.

Several persons mentioned having seen bees fighting birds.

Question: are desired, is it preferable to give the queen-rearing colony eggs or treshly-hatched larvæ?

hatched larvæ?

Answered by several: Eggs are preferable. Remove the queen, eggs and young larvæ from a strong colony, then select two or three combs of and young larve from a strong colony, then select two or three counts of freshly deposited eggs from the colony you wish to rear queens from, and place in the centre of the queenless colony. Retain the first completed cells, and destroy the others.

President Miller has reared some of the best queens in this manner, and some of the very poorest he ever saw.

A communication was read from J. Messimore, Millwood, Ind., entitled

#### The Dzierzon Drone Theory.

I am sorry that I cannot attend the Chicago Convention this session. Had it been a month earlier I could have it been a month earner 1 come near attended, but now the time approaches when bees must be prepared for winter, and as I have not made much preparation in that direction as yet, I must be getting them ready. I anmust be getting them ready. I anticipated being with you, but circumstances will prevent it. I intended, if I could have been present at the Convention, to give the Dzierzon theory concerning the drone progeny of pure but nigerated gueens a little ory concerning the drone progeny of pure, but mismated queens, a little probing, as I see that many apiarists are beginning to doubt the truthful-ness of that theory. When I first commenced the study of bee-ology I accepted the theory, but have, for some time, had serious doubts about it; but not having the means at hand, I have never experimented on it. One thing, however, I have observed, which led me to doubt the theory: I have had queens whose workers showed no had queens whose workers showed no signs of impurity whatever, and whose drone progeny were so uniform and similar that you could scarcely tell one from another. Daughters of such queens I have had mate with black drones, and, as a consequence, their drone progeny were just as dissimilar as their workers, not only in color but also in size. Now, how can that be accounted for if the Dzierzon theory be true? This led me first to doubt be true? This led me first to doubt the correctness of the theory. Have we no apiarists in America capable of testing this matter, with the proper means at hand? Must we forever de-pend on men of other nations to demonstrate this matter to a certainty?

Millwood, Ind.

#### How Increase -- Natural or Artificial?

Mr. Thompson thinks the practice of natural swarming should be con-signed to the shades of the past, with the discarded box hives, 10 and 20 pound boxes, and brimstone fumes.

Mr. Funk suggested that at times the trouble was not so much how to increase, as to the best methods of

preventing it.
President Miller is opinion that all depends upon whether increase is desired.

Mr. C. W. McKown preventsswarm-

Mr. C. W. McKown prevents swarming by clipping the wings of queens.
Mr. A. J. Hatfield has found that clipping the wing of a queen has a tendency to break up and demoralize the swarm, they frequently entering other hives besides their own, and creating great confusion among other ating great confusion among other

ating great contrision among other colonies.

Mr. T. S. Bull much prefers natural swarming, and but seldom loses one; this season, with more than 40 natural swarms, he has lost but one.

Mr. Hattield has found that his colonies which stood in the sun, without

onies which stood in the sun, without any shade whatever, swarmed most persistently.

President Miller has had them

swarm quite as frequently where the hive was entirely shaded, as those standing in the sun.

The majority of opinion was that

with plenty of shade over and room in the hive, the tendency to swarming the hive, the tende was much lessened.

Adjourned till 7 p. m.

#### EVENING SESSION.

Where the best queens | President of the North American Bee-Keepers' Society: Peoria, Ill., Oct. 22, 1881.

To Northwestern District Convention. During the late State Fair, held at Peoria, Ill., we were conversing with members of the Board of Agriculture with reference to the meager pre-miums offered by that body for beewith reference to the meager pre-minus offered by that body for bee-culture. We were told that it was the apiarists' fault, that they had not taken any interest in the matter. We were requested to issue a call for a Convention to assemble at Springfield, at the time of the meeting of the State Board of Agriculture, to take action in the matter. Bee-keepers of Illinois, is it best to issue this call? We would like to see a big show of everything pertaining to a first-class apiary at the fair of 1882, and we can have it only by working for it. Those of you who deal in supplies are the ones who would be benefitted more or less by this display, and are you willing to assist? Let us hear from the bee-keepsist? Let us hear from the bee-keep-ers of Illinois on this question, whether it is best to call a meeting, or try to

work up the desired result by writing. Lucinda Harrison. State Vice President.

On motion of C. C. Coffinberry, Mrs. L. Harrison, of Peoria, Ill., was made an honorary member of the Society.

The following resolution was offered

by Mr. Coffinberry:

Resolved, That the Northwestern Bee-Keepers' Society indorse the action of the National Convention in encouraging bee and honey exhibits at State and Local Fairs and Exhibiting and that Mrs. Harrison, Vice. tions, and that Mrs. Harrison, Vice President for Illinois, and the Com-mittee appointed by the National Somittee appointed by the National Society, have our hearty co-operation and encouragement in their labors in this behalf.

Mr. Coffinberry hoped the Society would take most positive and unmistakable action on the communication from Mrs. Harrison; the question of making exhibits at State, county and local fairs was one of the gravest importance to those engaged in bee-culture. It is not enough to form societies and hold conventions for the purpose of instructing bee-keepers as to the best methods of preparing bees to the best methods of preparing bees for winter, or of producing honey for market, or as to the best race of bees; we have but half done our work when we have learned all the improvements our fellow-apiarist employs, or taught him all we know. There is a vast public which needs educating as to public which needs educating as to the value of honey for dietetic and medicinal consumption. Their preju-dices must be removed, and a desire and taste created for honey, as now exists for sugars and syrups. Bee pa-pers cannot accomplish this work, be-crused they circulate whelly among cause they circulate wholly among that class of people who can already appreciate the value of honey; it cannot be done through the agricultural press, because nearly all farmers are already consumers, and utilize its economic properties: we cannot educate omic properties; we cannot educate the masses through the metropolitan and general press, because they collate their reading matter with a view

to interesting the general reader.

The speaker can see no plan for carrying on this educational work so feasible, as to take advantage of the large popular gatherings—and especially fairs and expositions—where pure honey can be exhibited in large quantities in its most attractive forms. Not only should the honey be exhibited and sold, but our beautiful and gentle Italians should be manipulated on the grounds, to attract the people through their instinctive curiosity: now and then a comb might be extracted and samples exhibited through the crowd; samples exhibited through the crowd; this, too, is a good opportunity to explain the process of granulation in honey, and how to liquefy it. The primary lesson in the consumption of honey can now be instilled on the public mind by having a quantity on sale in neat, attractive packages, and of proper sizes for family use.

Bee and Honey Shows.

The Secretary read the following communication from the State Vice managers are not benefiting honey

producers alone. If it be their duty to assist in developing the natural and possible resources of our country, they certainly by every means should en-courage these exhibits. Our present product of millions of pounds can be easily developed into billions, and many millions of dollars be added to the productive wealth of the country. Certainly, at our State and county fairs, the apiarian department should be given a prominence at least equal to that of the horse, cow and sheep, and second to none.

Nor need bee-keepers fear that education will lead to over-production. We have, and there is springing up, a foreign demand for American honey that will consume, at remunerative prices, all the surplus we may have to spare, even though it be an hundred fold. Over-production, over-stocking and competition are fast losing their terrors for the reflecting mind, and terrors for the reflecting mind, and stimulated consumption, generous rivalry, and co-operative effort are fast

usurping their place.

Mr. T. G. Newman said that he indorsed most fully the remarks of the last speaker, and would give a few ex-

amples of the educating power of bee and honey shows.

Some two or three years ago Mr. Scudder, one of the members present, scudder, one of the members present, took several thousand pounds of honey in the comb to Canada to sell, and found it almost impossible to dispose of it. Since then, magnificent displays have been made at the fairs, and every pound at those displays was sold too the ground at good prices. Now on the ground at those displays was son on the ground at good prices. Now Canada cannot supply her home de-mand, and this year has sent to the United States for thonsands of pounds more. What has made the change? Consumers have been educated—have tasted of honey and found it good, as Solomon said, and now are everywhere

demanding more.

At the St. Joseph, Mo., Exposition the honey and bee display attracted more attention than everything else on the ground, excepting the award of the prize of \$25 for the best looking colored baby!

In 1878, 180 tons of comb honey were sent to England; and at the Royal Agricultural Show it was arranged in Agricultural Show it was arranged in a magnificent pyramid with a large sign, "American Honey," over it, and the "stars and stripes" hanging in graceful folds around it. This not only took the first prize, but created such a fwore that the Prince and Princess of Wales and the Royal family came to the apiarian department in carriages to see it; alighting, they came in to examine it, and sought information regarding its production on so large a scale and in such tempting packages. A dozen crates of it were ordered for the Royal table, and, from ordered for the Royal table, and, from the Queen to the peasant, all caught the enthusiasm. I was amused at some of the effects of this display that I noticed in London. While walking down several of the busy streets I noticed here and there a crowd had gathered and blocked up the sidewalk. Coming closer, I found the cause of the excitement; show windows had been filled with comb honey, and a card announced that it was American boney and for sale at 28, 6d, per lb. honey and for sale at 2s. 6d. per 1b. (60 cents). There they stood and gazed npon it, their very eyes seemed riveted to the spot—but no word was heard—

'It seemed as though they saw a miracle, And for very rapture ne'er would speak again."

while their eyes feasted on the magnificent display of concentrated sweetness from

"The land of the free And home of the brave!"

Not until sturdy policemen came to the relief of pedestrians could the crowd be dispersed. The order to "Move on; move on!" was obeyed, but only to let another crowd form a

this scene over and over again.

This "word-picture" gives us a striking lesson—to exhibit and display our honey, and thus educate the masses who by thousands carry home the small quantity to delight their fami-lies, and give them health and strength both of body and mind, by the use of

this God-given sweet! How much better to do this than to feed our sweet better to do this than to feed our sweet babes and tender offspring upon vile glucose in the torm of syrups, candies and condiments, and thus send them to an early grave or sow disease in their little systems, by permitting them to use the accursed stuff made from ald cluthes, boot heels and dirt from old clothes, boot heels and dirt. which greedy and conscienceless men have made solely for the purposes of adulteration!

Yes; let us use every means to introduce honey to our neighbors—to tempt them with its beauty and beguile them with its sweetness. Let us gune them with its sweetness. Let us take possession of every State, County and Local Fair, in the name of humanity, and educate the people with such magnificent exhibits of honey that they never any formal it. that they never can forget it. Dis-tribute to the admiring growd the evidence that honey is good, not only for gence that honey is good, not only for Food—giving warmth to the system, vigor to the vital functions, strength to the body and force to the mind—but that it is good for MEDICINE, healing many forms of disease and pro-

longing life.

Mr. Newman remarked that he had spent thousands of dollars to help open up the markets of the Old World. to honey, and notwithstanding the fact that he had been roundly abused by short-sighted men for so doing, who by short-signed that it would be an injury rather than a benefit, yet he was glad to see that the beneficial results were being noticed. Europe is holding out her hands to us and demanding tons of honey, when we have not a pound to spare—our home markets taking all we can produce with our limited numwe can produce without mixture with our mixture ber of bees; but sweetness enough is going to waste to produce billions of tons, and the speaker said that the time was coming when a revenue of millions of dollars would be received. annually from foreign lands for honey that was now not gathered. He knew that intelligence and energy, coupled with improved implements and the "coming bee" would overcome all would overcome all "coming bee," would overcome all obstacles and contribute a supply of superior honey to all the markets of the world.

Mr. L. H. Scudder remarked that the masses of people needed education in masses of people needed education in the production and consumption of honey. Three years ago he, with a neighbor, went to Canada to dispose of their crop, but no one understood the value or merits of honey for home consumption; their only sales of ex-tracted honey were in drug stores in very small lots for medicinal purposes. Finally, after two months spent in Finally, after two months spent in Canada in a vain effort to sell this car load of honey, they returned to the United States, and disposed of it in job lots.

The resolution was then unanimously adopted.

### Increase of Bees.

Mr. Funk says it is best to increase if the swarming fever gets full sway; but, otherwise, run colonies as strong as possible.

Mr. Seudder thinks a moderate increase is most practicable, then double up when the honey harvest has ended.

President Miller adopts the plan as practiced by Mr. Doolittle to prevent the increase of colomes; by caging the queen when the swarm comes out, five days after destroy queen cells, return the queen, and generally they work without interruption.

#### Use of Separators.

Mr. McKown asked if any one had used sections filled with foundation, and without separators?

Mr. Sendder said his bees would not

build straight combs without separators, even with full sheets of founda-

President Miller would like to abandon the use of separators; but has never been able to pack his crates with sections built without.

Mr. Funk has not been able to get straight combs without separators.

Mr. Newman does not think straight combs can be built without separators, to the extent of meeting the full demands of the market.

President Miller has used wires stretched across instead of tin, but found the wires would not only sag, but were imbedded in the honey

Mr. Palmerston has used perforated Aff. Camperson has used very nicely; but he does not know that they were any better than the full

sunface of tin.

Mr. Newman thinks unless they are than the full surface of tin, they will prove impracticable, as they

cost at least 50 per cent, more.
President Miller finds that in the fall bees fill up the sections better with separators nearly the full width

Mr. Scudder has found a great advantage in the use of separators in removing sections as fast as finished; he can remove a section at any time without disturbing the remainder.

#### Side and Top-Storing.

President Miller thinks there is an President Miller thinks there is an advantage in side-storing, inasmuch as the hees will begin storing at the side first in the spring. He does it in this way: When the honey season commences, he uses about 8 Langstroth frames, which gives him an extra space at one side; he then raises a brood frame from the brood chamber to the super. Dutting down a division to the super, putting down a division board to take the place made vacant by the removal of the frame; he now places two cases of sections in the su-per, one on each side of the brood frame; in four days another case with sections is placed each side of and next to the frame containing brood. and this course is pursued till the super is filled with sections, and the brood frame returned to the brood-chamber. He has found, however, that some times they bulge the sections a little before the super is entirely completed.

It was suggested by a member that perforated separators would obviate

this trouble.

President Miller explained that he ntilizes the space at the side of the lo-frame Langstroth hive by putting down a division board, and can use it or fall for winter feeding. He leaves the space unoccupied in summer, and finds it convenient as a pocket to frames in when looking through the brood chamber. He has had some trouble with the queens going into the sections and depositing eggs.
Adjourned till 9 a. m.

WEDNESDAY-MORNING SESSION.

Convention opened at 9 o'clock, President Miller in the chair.

## Pasturage for Bees--Over-Stocking.

President Miller stated that although many might not feel an interest in this subject, he thought all would sooner or later be compelled to give it attention.

give it attention.

Mr. Scudder being called upon, stated he had kept over 200 colonies in one location. Some seasons he thought all had done as well as a lesser number would; in other seasons he thought the locality was over-stocked.

Mr. Bull has kept over 200 colonies in one location. He thinks, in a good season, it is impossible to over-stock a good location.

Mr. Chapman thinks with Mr. Bull. He has kept 225 colonies in one locality, and does not think he was overstocked. He will only run about 100 in one locality hereafter, because he cares for no more than he can take

Mr. Coffinberry called for information: How many colonies can subsist in a good locality, with a good honey

Mr. Thompson thinks in his location 1,000 colonnes would not have over-stocked the past season. President Miller has felt at times

President Miller has felt at times at his location has been overthat stocked.

Mr. Thompson thinks bee-keepers

will, sooner or later, plant for bees, as for cattle and sheep. He spoke highly

of sweet clover.

Mr. Bull has no difficulty in eradicating sweet clover from his orchard.
He thinks it no more difficult to destroy than ordinary weeds.

pay to transplant sweet clover?
Several stated it would, if taken up

before the roots have penetrated

Mr. Lucas has planted ten acres. He saw bees storing honey in boxes from it two weeks ago, after every-thing else had failed.

thing else had failed.
Dr. Haskin has had no trouble in
exterminating sweet clover when he
has not wanted it to remain.
Mr. Newman thinks this a most important topic. If it will pay to gather
honey from white clover and basswood, it will certainly pay to keep sweet clover for them.

1. Lee Anderson has had trouble in

his comfield from sweet clover. He has been trying to exterminate it for two years, but as yet has not suc-

ceeded.
Mr. Thompson suggested that if mowed in June, it would bloom much

later, and more profusely.

Mr. Seudder called attention to the Simpson honey plant (figwort). It is good for honey, but is difficult to deyelop to any extent. It is, however, a splendid honey plant, when properly It is, however, a developed.

The Secretary read a paper from Rev. A. Salisbury, Camargo, Hl., entitled

#### Can it be Accomplished?

There should be a uniform market price for graded honey of the same quality, and all the proceeds of the apiary, corresponding in value with aparry, corresponding in vame with all other lucrative avocations, in pro-portion to the amount of capital in-vested and labor expended to make it a success. However scientific and attractive any business may be of itself. if it does not remunerate capital and labor corresponding with other pro-fessions and pursuits, it loses its posi-tion of honor in the eyes of all the world, and at once becomes enfeebled. and time is the only arbitrator of its sad destiny. This has been accomsad destiny. This has been accomplished in other pursuits—for exampushed in other pushes—for example: The manufacture of guin boots and shoes. The several producing establishments of the country agree, and bind themselves in a penal bond of \$20,000, to produce the same quality of goods, and sell these goods at corresponding prices. The only cutting responding prices. The only cutting on prices is done in the hands of the retail merchant.

Can we not learn a lesson here, and Can we not learn a lesson here, and pause but for a moment to think of the omnipotence of co-operation. Are those who jointly work in the apiarian business, whether in the person of an editor of a bee paper, or a producer of honey or supplies for the apiary, men and women of inferior ability? The response is in the negative.

Light was never brought ont of darkness, or order from chaos, to reign at

ness, or order from chaos, to reign at once in perfection, but by one in whom imperfection never existed. So we may expect our co-operative work, atthat expect on too perfection. We cannot expect men and women who keep bees and raise honey for the market, at once to see the importance of a Naonce to see the importance of a National Society, supported by auxiliary State and County Societies, and the greater composed of delegates from the lesser, with duties not only to express the rights of the respective. press the wishes of the producer, but to carry all statistical information to the highest authority, and clothed with power to cast a vote for the good of the whole. Can it be accomplished?

Mr. Newman addressed the Convention, on the above subject, giving

# A Few Thoughts on Marketing Honey.

The Arabs, it is stated, obtained their knowledge of Astronomy while crossing the trackless desert, being compelled to observe very closely the position of the stars to guide them in their journey. Just so should the beekeeper closely watch the continual and varied changes that occur in the devaried changes that occur in the demands of the public concerning the preparation of honey for the market. Instead of settling down to the con-clusion that, in reference to marketing honey he knows it all, he should be careful to observe what dealers and consumers demand, and then at once,

Mr. Wemple inquired if it would freely and fully meet the requirements of the trade. In this way only can be

The trans. In this way in your hereome a successful apiarist.

The progressive producer of this God-given sweet is never surprised to find that the methods of preparing

God-given sweet is never surprised to find that the methods of preparing honey for the market, which were acceptable one year, are behind the times for the next season.

It should never be forgotten, while marketing honey, that good quality and attractive packages will commond the highest price, and be in constant demand. These tempt the purchaser, and cause a steady demand.

A producer who is "behind the times," brings his comb honey to market in 4, 6, 8, or 10 lb, boxes, as he did

ket in 4, 6, 8, or 10 lb, boxes, as he did years ago, and wonders why he is of-fered 4 or 5 cents per pound less for it than his neighbor, who obtained his honey in single sections. But he finds, to his sorrow, that he is not only "behind the times" in producing the honey, but also sadly behind in obtaining a market for it, even at a discount of one-quarter of its entire value.

Again, a buyer of honey said in our hearing but a few days ago, that it was tun to him to find a man who was not "up to the times" in being posted on the value of his crop. He went down to Water Street and found a nice lot of basswood honey in the hands of a commission merchant who had not taken the trouble to post himself on the value of the honey, and was will-ing to take an offer some 3 cents per pound less than the real market value.

Those who think they cannot afford to take a paper devoted to the interests of honey producers, often sacrifice 50 times its cost in the sale of their crop times its cost in the sale of their crop of honey—and does it not serve them right? Surely it does! But the inno-cent sufferers are those who find the market price weakened, if not abso-lately broken by such reckless and improgressive persons. Here, let me say to those bee-keepers who object to have their neighbors take the bee papers, least they may "tread on their corns," that they are not only stand-ing in their own light, but are using ing in their own light, but are using argument which comes home to them with double force, when they find the unsophisticated ones cutting the prices, by their ignorance of what they ould and should learn from the papers

devoted to bee-culture.

Extracted honey is gaining ground daily, and is destined to become the staple product, while comb honey, ever delicious and enticing, will hold

its own as a fancy article.

Extracted honey should be put up in small packages—jars, cans, pails etc., for retail, and in small kegs for wholesale. It is a sad blunder to use barrels holding from 200 to 500 pounds. —they are too large to be desirable for the trade, too bulky to be handled with care in transportation, and too dear to be lucrative to the producer, for honey put up in such large barrels is subject to a discount of one cent is subject to a discount of one cent per pound, because of the difficulty in disposing of it without repacking and dividing into smaller lots.

If a "word to the wise is sufficient,"
I hope that "the wise will understand," and profit by these brief suggestions of their friend.

Hereupon sprung up a discussion as to the relative value of comb and ex-tracted honey in market.

Mr. Anderson inquired what yield

Mr. Anderson inquired what yield of comb honey is proportionate to a yield of extracted?

Mr. Bull thinks about one-half.

Mr. Niehaus run this season 17 colonies for comb honey, and realized a little over 3,000 lbs.; he also run 8 colonies for extracted, and took about the same number of pounds.

the same number of pounds.

Mr. Thompson can get 300 lbs. of extracted as easily as 100 lbs. of comb

Can one person take care of more bees running for comb honey than he can for extracted?

can for extracted?
Mr. Niehaus would rather take care of fifty colonies running for extracted than the same number for comb honey; in fact, he would rather take care of 75 of the former than 50 of the

Adjourned till 1 p. m.

AFTERNOON SESSION.

President appointed Mr. Scudder, or. Haskin and Mr. Wemple a com-

mittee on exhibits.

Moved and carried, that time for adjournment be fixed at 5½ o'clock.

Mr. Hatfield moved that Mr. Newman be requested to write out his address of yesterday, and publish if in full with the minutes of the Convention. Unanimously adopted.

The first subject being Wintering a communication was read from T. F. Bingham, Abronia, Mich., entitled

#### Wintering of Bees.

Enough has been written in the past 20 years to demonstrate that as one point in practical apiculture is unsolved—viz., safe wintering. Time out of mind has demonstrated that a good stone cellar, entirely under ground, is the safest and most economic. ground, is the satest and most economical plan yet devised. A plank-lined cellar, theoretically, is not as good, for the assumed reason that the radiation of warmth from the ground is more or of warmin from the ground is more or less impeded by the plank lining, which is a poor conductor of caloric, and a poor absorbent of heat. Nothing but stone lining can secure all the points requisite for a bee-cellar. It is of but little moment to practi-

cal bee-keepers how much theory is put forth. The fact stands out clearly put forth. The fact stands out clearly that bees never wintered safely in cold latitudes. There was and is an un-measured factor staring us boldly in the face, which we call "risk." It is the face, which we call "risk." It is not probable that we shall ever entirely surmount this obstacle to aulimited honey production. To reduce the risk to a minimum is all that we can reasonably hope. Then, with our ready and accumulating resources, we may hope to compensate for our oft-recurring but uncertain losses.

We are indulted to the Rey L. L.

We are indebted to the Rev. L. L. Langstroth for detailed experiments in chaff and wool-packed hives and mats. Time has demonstrated that such protection is valuable; but as yet no safe winter bee hive has been invented. That field is yet wide open. The bee periodicals have teemed with fine logic and profound reasoning, based on assumed facts and uncertain data, that the causes were so-and-so and such-and-such. But the implements have not yet been invented whereby these causes can be removed or avoided. Practically, we are no better off than one year ago. All we can do is to do the best we can with the can do is to do the best we can with the well-tried ways, until some ingenious inventor shall kindly donate to the In-dependentOrder of Bee-Keepers a double-draft, double-blast, blow-hot-andblow-cold Eureka pollen extractor.

Upon a sense of the meeting being called for regarding in and out-wintering, the expression was in favor of cellar-wintering.

Question: When is the best time to put bees away in the cellar for winter

Mr. Thompson thinks the first snow-storm in December is soon enough, as there is more or less of warm weather in November.

Question: When is best to take them out? Answered by several, when the weather becomes settled in

President Miller has practiced taking them out at the beginning of maple bloom.

Mr. Scudder. It is not a safe rule, as frequently maple blossoms are frozen after blooming.

## Questions.

Mr. Newman was designated to answer the following questions:

Is it advisable to use full sheets of

thin foundation in the surplus boxes?

Does the size of the cells that the worker bees are cradled in have any influence on the size of the adult bee?

Which is the best way to introduce virgin Italian queens into black colonies?

Mr. Bull answered that after a Mr. 19411 answered that after a swarm has emerged, to let the virgin queen run in at the entrance of the hive immediately, she will be received at once. Care must be taken to run her in before the bees are settled into

quietude in the hive.

Mr. Palmerston inquired for the method of preserving surplus

best method of preserving surplus combs?

Mr. Bull hangs his combs on a rafter in his shop. The motheggs freeze and fail to hatch in spring, and he puts them in use before they can be occupied with moths.

Described Willenshees anyty combs.

President Miller places empty combs in the supers, and puts them away in a cold, vacant room.

#### Doubling-up in Spring.

Question by the President: Can we get more honey by doubling up in

we get more honey by doubling up in spring?
Mr. Niehaus doubles up as strong as possible in the spring.
Mr. Thompson practices the same course. He slices an onion, putting a piece in each hive the day before doubling, then with the use of a little smoke, there will be but little if any lightly. fighting.

#### Miscellaneous.

Mr. Newman, special committee on statistics, gave the following condensed report of those now present: No. of colonies in the spring, 490; No. of colonies now, 1,14s; increase, 136 per cent.; extracted honey, 19,270 lbs.; comb honey, 17,867 lbs.; average per comb honey, 17,867 lbs.; average per colony, 80 lbs. Several report queen-rearing as having been a specialty with them, thereby lessening the general yield.

To get bees off the sections when removing the cases from the hive: President Miller has found no better way than to brush flem, hanging the corner of the case on the front of the hive, and brushing with a turkey

feather.
Mr. Thompson thinks smoke will sometimes injure honey with its fla-

The following resolution was then

adopted:
Resolved, That all correspondents for the bee papers are hereby requested to write as a suffix to their signatures the actual number of colonies on the 1st of May, with which to com-mence the season, to enable readers to compare practice and results.

#### Report of Committee on Exhibits.

The following report was received and adopted:
The committee on exhibits find the

following articles on exhibition:
From T. S. Bull & Son, Valparaiso, Ind., one crate of white clover honey, put up in prize boxes, and packed in one of their crates. It is beautiful. one of their crates. It is beautiful, and will command admiration in any market

From II. Niehaus, Burlington, Wis., one crate white clover honey in prize boxes, one crate fall honey in prize boxes, and one crate white clover honey in 1 pound sections. These specimens are all gilt edge, and should

specimens are all gilt edge, and should bring fancy prices. From S. D. Buel, Union City, Mich., a sample shipping crate for 2 pound sections. The distinguishing features are: 1. Four pieces running cross-wise of the bottom of the crate, on which to rest the lower corners of the section; 2. An inside groove on each side down which to slip the glass; 3. An in-fitting cover, to prevent the entrance of bees, flies, etc. The crate is very neat in appearance.

From F. W. Chapman, Morrison, Ill., specimen of peet for smoker [vel.

This ignites very readily with a match, and furnishes a profusion of smoke.

From Wear L. Drake, Chicago, 11L, a model for brick wintering bee house influence on the size of the adult bee Yes.

Are all the eggs laid by the queen hatched by the worker bees? No.

Question: Does it pay to rear dollar queens? Answered by Mr. Good, that he has made it pay to rear them.

a model for brick wintering bee house and summer refrigerator. This is built with double walls of hollow brick, and is frost and heat-proof. The inventor claims, among other things, a uniform temperature during winter and summer and cheapness in construction.

L. H. Scudden, Ch'n.

Mr. Chapman presented the following preamble and resolution, which were adopted unanimously:

"Thereas, The Northwestern Bee-Keepers' Society has enjoyed the hospitality and favors of Mr. T. G. New-

man; therefore,
Resolved, That this Society tender to Mr. Newman their thanks for such favors, and wish him abundant success in his landable undertakings.

The Convention adjourned to meet in Chicago on Wednesday, in the last week of the Exposition, 1882. C. C. MILLER, Pres't.

C. C. COFFINBERRY, Sec'y.

What's the Matter!—Only 31 colonies of bees reported from this State in the spring, and 2,306 lbs. of honey! I know of one man who has sold about 4,000 lbs. of honey this season in Sampson County, and I can count over 200 colonies that I know of in this township, about 75 of them in American and Langstroth hives, so I think it is safe to say there is at least 1,000 box hives in this county, and judging from what I find in a report from an agricultural paper, there is berhans agricultural paper, there is, perhaps, 50,000 colonies in box hives in the State. The movable frame hives are a State. The movable frame hives are a new thing here, but many are trying them. Noall DEATON. Carthage, N. C., Oct. 22, 1881.

Good Honey Crop. -1 got an average of 120 lbs. of comb honey per colony in the spring, and when I get out and sell off my crop, I shall have realized satisfactorily. T. L. Von Dorn. Omaha, Neb., Oct. 24, 1881.

Bees in Good Condition .- 1 Bees in Good Condition.—I have sowed 2 acres of cheome and melilot, and  $\frac{1}{4}$  acre of spider plant. I want all of the best plants for bee pasturage. My bees are in better condition than ever before in the fall, and the queens are still laying.

R. W. KEENE, M. D. Versailles, Ky., Oct. 25, 1881.

Honey Producing Plants,—Prof. Beal has kindly identified the plants which were shown at the National Convention by our genial friend the Rev. L. Johnson. The larger one is the Sida (Sida spinosa). If is a mallow and so related to the hollyhock, to the abufilon and to the cotton plant. The smaller plant is knotgrass, goosegrass door-weed (Polygonum aviculara). As smaller plant is knotgrass, goosegrass door-weed (Polygonum aviculare). As will be seen, this is a close relative of buckwheat. Among the other interesting things which I learned from our ingenious friend Della Torre, of Maryland, blue thistle was a valued honey plant of his region. I have some of these plants from him, and they prove to be Viper's Bugloss or blue weed (Echium vulgare). This is not a thistle at all, and illustrates the need of scientific names. It does not even of scientific names. It does not even belong to the Composite family, but to the Borage family. It has rough brisfles, and resembles thistles somewhat in other respects. Gray says it is a troublesome weed in Virginia, and rare northward. I have set out the plants received from Mr. D. in our apiary grounds. I shall see if its reputation in the south as a honey plant is merited north. Experiments in the direction of better and more constant forage for our bees, promises much of scientific names. It does not even forage for our bees, promises much that is valuable. A. J. Cook. that is valuable.

Lansing, Mich.

Honey Cake.—In the BEE JOURNAL for Oct. 5, I noticed that Mrs. J. G. A. Wallace presented 2 honey cakes to the Ontario Bee-Keepers' Convention. If that lady would give the receipt for these cakes in the BEE TOURNAL, it would accommodate many readers.

W. S. PIERSON.
EUreka, Mich., Oct. 24, 1881,

Dry Season in Georgia.—I had 3 colonies of bees in the spring, and now have 8; I increased by natural swarming. I have taken about 119 lbs. of comb honey; it has been so dry that the bees have not been able to do anything since July came in. I cannot think of doing without the BEE JOUR. NAL, and you may count me a life subscriber. It is the best paper I get.

WM. L. GILREATH.

Teloga Spring, Ga., Oct. 11, 1881.

Sweet Clover.—Please let me know through the Bee Journal whether sweet clover will do well on bottom land that overflows once or twice a year, and what honey plants do the best on such land? There are 5,000 to 10,000 acres of such land within reach of one of my apiaries. Will it do to sow sweet clover in winter on thin snow? My bees have averaged about 10 lbs. of comb and extracted honey per colony. I had one colony that gave me 70 lbs. Increase is about 60 per cent.

A. J. Norris.

Cedar Falls, Iowa, Oct. 22, 1881.

Cedar Falls, Iowa, Oct. 22, 1881.

[We do not know whether sweet clover will do well on such land, but it is worthy of a liberal trial. Hydropiper (by many called smartweed, oxeye and heartsease) is adapted to the locality, and gives an abundance of late though splendid honey. It will do to sow sweet clover on the snow. but we prefer it under.—ED.]

Sixty Pounds per Colony.—I was brought up among bees. This season is one of the best I have known. Last winter was very hard on them; most of the bees kept by farmers died. I started in the fall of 1880 with 160 colonies in good condition. I put them in two cellars, about Nov. 15; about one-half in each. One lot was in a house cellar; the lowest temperature was 39-, and the highest 48-. The others in an out stone cellar that did not freeze, but the bees did not winter as well; they run down more in the spring, and lost more in the cellar. I commenced taking them out March spring, and lost more in the cellar. I commenced taking them out March 16, and finished April 4. I lost in cellars 14. On May 1st, I had 135 in good condition. Now I have 200 in good condition. I have received about 3,200 lbs. of extracted, mostly white, and 4,000 lbs. of comb honey—an average of 60 lbs. per colony.

D. E. FLOYD. Ephratah, N. Y., Oct. 24, 1881.

Good Increase.—I put 4 colonies in a cellar last winter, and had but 1 in the spring; they were hybrids. But I can discount most any thing in the way of increasing, for they showed such a vigorous disposition to in-crease. I did not feel willing to trust them, and divided the bees, brood and honey, till I obtained 4 new colonies. At present they are strong, and full for winter, after taking 100 lbs. comb honey in 1 and 2-lb. sections. I could have had 50 or 100 lbs. of extracted, had I an extractor.

S. J. McKinney. Burlington, Iowa, Oct. 23, 1881.

Bees in Canada.—Bees have done unusually well in this part of the country. I wintered without loss, and country. I wintered without loss, and the bees were in good condition. They the bees were in good condition. They did not swarm as much as in other seasons, but gathered twice the amount of honey, and the colonies are the iest I ever had at this time of the year. The honey, in glass boxes, holding 10 to 12 pounds, sells readily at 15 cts. per pound. P. B. INGLIS. Castleton, Ont., Oct. 17, 1881.

[Had it been in 1 or 2 lb. sections, it would probably have sold for 20 cents or more per pound.—Ep.]

The Southwestern Wisconsin Wisconsin Platteville, Grant Co., Wis., Nov. 30, 1881.
N. E. France, Sec., Platteville, Wis.

# Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Advertisements intended for the Bek Journal must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

🕼 Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists Langstroth,Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the old as well as the new address.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

An Agreeable Dressing for the Hair, that will stop its falling, has been long sought for. Parker's Hair Balsam, distinguished for its purity, fully supplies this want.

44w4

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the buyes in this site. are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey," for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the Journal for a year free. It will pay to devote a few hours to the Bee Journal.

Women are Everywhere Using and recommending Parker's Ginger Tonic, because they have learned from experience that it speedily overcomes despondency, indigestion, pain or weakness in the back and kidneys, and other troubles peculiar to the sex.—

Home Journal. See adv. 44w4

It would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.— Also, if you live near one postoffice and get your man at another, be sure to give the address we have on our list.

Why suffer such unspeakable tortures? Rheumatism has been conquered. Kendall's Spavin Cure is the victor. See advertisement. 41

We have a SPECIAL EDITION of the Weekly Bee Journal, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, {
 Monday, 10 u. m., Oct. 31, 1881.

The following are the latest quotations for honey and beeswax received up to this hour:

#### CHICAGO.

HONEY-The market is lively and prices steady, We quote light comb boney, in single comb poxes, 18620c; in larger boxes 2c. less. Extracted

@90. BEESWAX – Prime quality, 18@22c. AL II. NEWMAN, 972 W. Madison St.

#### NEW YORK.

HONEY.—The advices give a middling fair crop of huncy. Moderate lots have arrived, but the demand so far has been very slow, and but little improvement can be expected until we have cooler weather.

We quote as follows: White comb. in small boxes, 18620c; dark, in small boxes, 15620c; dark, in small boxes, 15620c; dark, in small boxes, 15620c; dark, 10641c; dark, 7659c.

BEESWAX.—Prime quality, 2156023c.

THORN & CO., 11 and 13 Devoc avenue.

HONEY.—Stendy. Comb 18&20c. strained, and extracted, 36x t2\(^1\_{2}\)ec.—top figures for choice bright in fancy puckages. On Tuesday was effected the remarkably large sale of \$19000 10s. strained and extracted (in bbls.) at \$9c.

BEESWAX—Selling lightly at \$19\tilde{2}\)0c.

R. C. Gueer & Co., \$17 N. Main Street.

#### SAN FRANCISCO.

HONEV-A slightly improved inquiry has been observed, and the few sules reported show a little more disposition on the part of buyers to pay full prices.

We quote white comb, 16@20c; (ark togo d, 10@ 14c. Extracted, choice to extra white, 9@10c; dark and candied, 7@8c. BEESWAX-23@25c. STEARNS & SMITH, 423 Front Street.

#### CLEVELAND.

HONEY—There is "an active steady demand in our market for one and two pound sections of white honey, all receipts finding ready sale at 21c. for 1 pound, and 20c. to 2 lb. sections, unglassed. Extracted honey containes dull at 12c. BEESWAX—20622C.

A. C. KENDEL, 115 Ontario Street.

#### CINCINNATI.

HONEY-Is in good demand here now. I quote: Good comb honey, in sections, is worth 1820c., on arrival. Extracted, 769c. on arrival. BEESWAA.-18622c., on arrival. I have paid 25c. per lb. for choice lots. C. F. MUTH.

#### BOSTON.

HONEY.—I-pound combs are a desirable pack-ge in our market, and a large quantity could be old at 20022c, according to quality. BEESWAX—P. ime quality, 25c. CROCKER & BLAKE, 57 Chatham Street.

#### BALTIMORE.

HONEY,-But little on the market, and prices are not quoted.
BEESWAX.-Southern, pure, 21@23c.; Western, pure, 21@ 22c.; grease wax, 11c.-Baltimore Market Journal.

## INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb, sections, 22@25c.—Indianapolis Stack Review.

#### PHILADELPHIA.

HONEY.-The supply and demand are alike nominal.

BEESWAX - Best light 23@25e,-Philadelphi-Merchants' Guide.

# The Bee-Keeper's Guide;

## MANUAL OF THE APIARY, By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Hinstrations,

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The dist edition of 3,000 copies was exhausted in about 18 months — a sale unprecedented in the annuls of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings— the products of the Honey Bee; the races of bees; full desceriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—L'Apiculture, Paris.

1 think Cook's Manual is the best of our American works.-LEWIS T. COLBY.

It appears to have cut the ground from under future book-makers.—British Bee Journal.

future book-makers.—British Bee Journal.

Prof. Cook's valuable Mammal has been my constant knide in my operations and successful management of the apiary.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Mamaal of the Apiary than from any other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees onglit to have, and which, no one who obtains it, will ever regret having purchased.—Mich. Far.

Is a musterly production, and one that no bee-keeper, however limited his means, can afford to do witbout.—Nebraska Farmer.

To all who wish to engage in bee culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Montheello, Ill.
With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Mannai,—WM, VAN ANTWERP, M. D.

It is the latest book on the bee, and treats of both the bee and bives, with their implements. It is of value to all bee-raisers.—Ky. Live Stock Record.

value to all bee-raisers.—Ky. Live Stock Record.
It is a credit to the author as well the publisher.
I have never yet met with a work, either French
or foreign, which I like so much—L'ABBE DV
BOIS, editor of the Bulletin D' Apiculteur, France.
It not only gives the natural history of these industrious insects, but also a thorough, practical,
and clearly expressed series of directions for their
management; also a botanical description of honey
producing plants, and un extended account of the
enemies of bees.—Democrat, Palaski, N. Walbara prepared with grant and control of the

producing plants, and un extended account of the enemies of bees.—Democrat, Palaski, N. Y.

We have perused with great pleasure this wade mecan of the beek-keeper. It is replete with the best information on everything belonging to apicultare. To all taking an intere-t in this subject, we say, obtain this valuable work, read it carefully and practice us advised.—Agriculturist, Quebec.

This book is pronounced by the press and leading becomen to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every anateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—Western Agriculturist.

This work is andoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the cure and management of the apiary. There is no subject relating to the culture of bees left antiouched, and in the compilation of the work Prof. Cook has bad the advantage of all the previous knowlede of apiarists, which he asses admirably to promote and make popular this most interesting of allocaupations.—American Inventor

It may safely be pronounced the most complete and comprehensive of the several manuals which

admirably to promote and make popular this most interesting of all occupations.—American Inventor It may safely be pronounced the most complete and comprehensive of the several manuals which have recently appeared on the subject of bees and their handling in aplanes. The studies of the structure of the discussion of clow workers of the structure of the discussion of clow workers of the structure of the discussion of the subject of the structure of the discussion of the subject of the structure of the discussion of the subject of the subject of management, extending to the smallest details, are all of bligh and practical value. Prof. Cook has presented the latest phases of progressive bee-keeping, and writes of the themes discussed in the light of his own experience.—Pacific Rural.

Of the many excellent works which we have examined on bee-culture, we consider Prof. Cook's the most valuable for the study of those who contemplate going into the business or are already keeping bees. If thoroughly studied, and its teachings conformed to, by the apiarist, who exercises a reasonable degree of common sense, he or she cannot fail to achieve at least a reasonable degree of success. The author addresses himself to the work with a decree of enthus lasm which carries the reader with him to the end.—Kansas Farmer.

Cook's Mannal of the Apiary holds in America the same high rank, that is accorded in Germany to the book of which Dzierzon is the author; the only difference being that Prof. Cook's Manual combines the profoundness of the German pastor with the specificity of the practical American. He refers in several instances to Darwin; and does not belong to that class which inter everything that is foreign, for he speaks of German naturalists with great reverence.—German Freidenker, Milwankee, Wis.

No. 45.

Published every Wednesday, by

## THOMAS G. NEWMAN,

EDITOR AND PROPRIETOR,

974 WEST MADISON ST., CHICAGO, ILL

#### TERMS OF SUBSCRIPTION:

WEEKLY-(52 numbers) \$2 a year, in advance Three or Six Months at the same rate.

SEMI-MONTILLY—The first and third numbers of each month, at \$1.00 a year, in advance.

MONTHLY-The first number of each month, at 50 cents a year, in advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

\*\*\* Remit by money-order, registered letter, express or bank draft on Chicago or New York, payable to our order. Such *only* are at our risk. Checks on local banks cost us 25 cents for collecting.

Free of postage in the United States or Canada Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

#### Sweet Clover Still in Bloom.

Mr. C. H. Dibbern, of Milan, Hl., under date of Nov. 1st, sends us the following unimpeachable testimonial of the late-blooming habits of melilot or sweet clover:

Enclosed please find a few racemes Enclosed piease and a few racemes of melilot clover picked in the open field to-day. This clover was in bloom all through our severe drouth, was then eaten down by cattle, but since the rains has come out again, and is now in full bloom. It shows what can be done with melilot. It blooks as if it done with melilot. It looks as if it would blossom all winter, if the frosts did not kill it, and bees seen it as eagerly now as in July.

The welcome fragrance of the flowers announced the contents of the letter, even before the envelop was cut open. While this article is being prepared for publication (Nov. 3, 10 a.m.) our first snow storm is prevailing in blinding clouds, and we have before us a modest bouquet of sweet clover blossoms, culled from under its snow winding-sheet.

Mr. E. Lucas, of Kirtland, Ill., stated in the N. W. Dist. Convention, on the 27th ult., that less than 2 weeks previously he saw bees storing honey in their section boxes from sweet clover, while nothing else could be found in bloom. He is so well satisfied of its remunerative ability as a honey producer, that he has seeded in ten acres

forage.

With Mr. Dibbern's letter before us, we are more than confirmed in the opinion that in most localities, by a judicious system of mowing or grazing, its honey flow can be protracted certainly four months, and, possibly, nearly five months.

## The "Coming Bee."

Hon. W. H. Andrews, of McKinney, Texas, writes us under date of Oct. 29, as follows:

Since my return home from Lexing-

since my return nome from Lexing-ton, Ky., I have overhauled my entire apiary, and find that I now have 275 colonies of Italians in good order. I got my Langstroth-fund Syrian queen home in good health; it took me five days hard work to get her ac-I never had so much trouble meen before. The colony to with a queen before. The colony to which I introduced her was in good condition to take a queen, but they seemed to know that this was a little, waspy, striped-backed concern, not the royal golden mother they once had.

have concluded to start a small Thave constitued to start a small Syrian apiary, though I am quite sure that the pure Italian (the brightest) is the much-talked of "coming bee," and that all talk is a mere waste of raw material when it points in the direction of an amalgamation of races, as it would take two or three such as it would take two or three such lives and fortunes as that of Mr. D. A. Jones', directed to and expended upon that one object, and that, too, without one material mistake; besides, it would take a ten years' session of the National Convention to determine the statement of the National Convention to determine the National Convention the N mine what races should be mixed, and what points should be brought out and what repressed; and then the trouble would only be begun, for the means by which these things could surely be accomplished, would require all of a lifetime of trial and study.

I hope that the next man who proposes the "coming bee" as a subject, will tell us what it is to be, and how he expects to obtain it; let us have one idea, just one, in regard to this matter.

We regret being obliged to differ with Judge Andrews regarding the present attainment of the "coming We feel confident that in his careful, discriminating management, even his beautiful "brightest" Italians will reach a point as much in advance of their present excellence, as they have advanced from their first importation. And that they have advanced we can well believe, after reading in the last BEE JOURNAL (page 347) the result of Dr. Brown's comparison between the tongues of Amercan-Italian bees and those bred from imported mothers.

But we learn another point from the of it, notwithstanding he is in an ex- | Doctor's able address, viz: that the | winter stores. To withstand our rigor- | a liberal patronage.

cellent locality for spontaneous bee tongues of the Cyprian bees, in a trial of six, aggregated 1-32 of an inch longer than he reached with six of his improved Italians, and they in turn aggregated 3-32 of an inch (one-tenth) longer than the imported Italians. Equally pronounced is the result of Prof. Cook's numerous microscopical measurements of the tongues of the Syrian bees, which he finds to equal those of the Cyprians, and .006 of an inch longer than those of the Italian. Here, then, is "one idea, just one, which must be taken into account in the development of the coming bee. Now, if the Syriaus are capable of as great improvement as has taken place in the Italians up to this time, we can count upon a tongue more than onethird of an inch in length, which will be sufficient to reach the nectar in the first bloom of red clover, and to render unnecessary any further efforts to secure Apis dorsata. That this almost fabulous length of tongue will be of any real benefit in Texas we cannot assert, but certainly it would be no disadvantage; in the Northern and Central States, however, where the broad and luxuriant red clover fields bloom but to "waste their sweetness on the desert air" with but rare exceptions, this will be a priceless boon to all bee-keepers. With the possibility of its accomplishment, it is worthy of the attempt.

> Amiability, however, must be a prominent characteristic of the coming bee, and with this point in view an amalgamation of races" may be the shortest road to success. We are quite positive we can distinguish much difference between the progeny of a Syrian queen mated with a Syrian drone, and that of one where the paternity is Italian. They are, too, more easily controlled with smoke.

Prolificness, also, will play an important part in deciding the choice of the coming bee. In the majority of locations where honey-producing is a principal industry, our bees are never too strong when the honey harvest comes upon us, but the reverse is the rule, and many of our most successful beekeepers double up and greatly reduce the number of their colonies to get them strong enough to take the fullest advantage of the yield. So that an improvement in this respect is desired, in our colder latitudes. In the South, where breeding is going on more or less all winter, this is not so desirable -in fact, might be detrimental, as causing too great a consumption of

ons northern winters, we need strong colonies of vigorous young bees on the early approach of winter; but in the South this is not so essential, as stimulative breeding can be resorted to at almost any time.

We cannot appreciate the necessity for the employment of two or three fortunes, nor the devotion of a "lifetime of trial and study." A material mistake might be annoying, but not necessarily fatal in gaining the desired result. Where it is possible to obtain several successive generations in a single season, and a number of queens at each breeding, much experimentation may be carried on in a few years, as compared with the breeding and improvement of four-footed stock of all descriptions; and there are scores of intelligent and observing apiarists in America at the present time, who are working with a view to developing a superior race, and have occasion to feel much encouraged.

Nor will it take a ten years' session of the National Convention to determine the matter. There may be differences of opinion, but the masses of the most discriminating will soon "agree upon an open verdict" when perfection is approached, and none are so blind as not to be easily convinced when self-interest is the argument to be met. The best bee will then be recognized as the most beautiful, because the prospective glitter of "money in the purse," realized from their excellence, will cast a silver sheen over the corselet if the coming bee should be a substantial brown, or golden clouds will float in fancy around our ideal bee if it should chance to be the brightest.

In view of the much which has already been accomplished in the improvement of our cherished Italians, we hope Judge Andrews will find other employment for his talented pen, and not indite a word which may tend to discourage the onward march of progress. We care not by what means obtained, whether from "an amalgamation of races," or from eareful selection and breeding, we trust no means will be left untried to produce the best. When obtained, we are confident the Judge will be as pronounced in his appreciation as the most expectant enthusiast.

We congratulate the bee-keepers of Kentucky upon the selection of the Farmers' Home Journal, of Louisville, as the Organ of the State Association. It is an excellent paper, and worthy of

Shipment of Bees by II. A. Burch .-The South Haven Messenger of Oct. 28. says:

Since our last issue, H. A. Burch & Co., shipped 22 colonies of Italian bees, consigned to parties in Michigan, Illi-nois, Indiana, Pennsylvania and Canada. Will the "old reliable" BEE JOURNAL ask Glevainys to give this item his "prayerful consideration?"

Certainly; it is "better late than never." Those who ordered bees in May and June and received them about Nov. 1, will think so, but they will also think they have been swindled out of a season's honey and increase, and also out of the difference in price of colonies of bees in spring and fall.

There has been much dissatisfaction for years with the fact that Club agents have offered the BEE JOURNAL at a less figure than the publisher's price. In future this will not be done. We have increased the price to clubs to stop this practice, and give the BEE JOURNAL at one price to all—and that the lowest that can be afforded. We have induced Mr. G. M. Doolittle to omit it entirely from his list, for heretofore that "List" was the greatest impediment to the establishment of a uniforn price. Mr. D. will write for the BEE JOURNAL as usual, and will take subscriptions only at the publisher's price.

New subscribers for the Weekly BEE JOURNAL, for 1882, will have all the remaining numbers for 1881 free from the time the money is received at this office. Therefore, the sooner they subscribe for it, the more they will obtain for the \$2.

MISCELLANEOUS.

Market Your Honey .- The Grange Bulletin gives the following advice for the present month. It is both good and timely, and should be heeded by those having honey to sell:

This is the month to market your honey. Remember too, the nicest looking honey will always bring the highest price. Extracted boney in small packages sells best put up in neat glass jars. For larger packages, 2½, 5 and 10 pounds, use tin pails or cans. If in sections, have them all clean and nice, and packed in a neat shipping crate holding not over 20 lbs. each. Sections should all be scraped each. Sections should all be scraped clean of propolis. In placing in the shipping crates, unless the comb is well fastened at the bottom, turn the sections top down to allow the honey to stand, rather than to hang on its own weight. Paste on a neat label with your name and location of your apiary. Sell as near home as possible, saving transportation and commission. At least, be sure your nearest town is well supplied.

Milkweed as an Insect Infoxicant .-By the kindness of Major D. H. Kelton, Mackinae, Mich., we have received the following item from the Scientific American of Oct. 29, 1881:

A writer in the Pharmaceutical Journal, speaking of a visit to Kew Gardens, says:

"It is amusing to see the numbers of bees hanging off the sweet-scented flowers of Aschpias cornuti (milkweed) perfectly intoxicated, so that they will not move even when roughly touched, one being noticed by the writer to be apparently "dead drunk" on the ground. The numerous bees which visited the flowers of the teasel seemed to be similarly affected. It would be interesting to learn whether the flow It would be ers of the Asclepias, which are known to contain a sort of sugar, really depossess an intoxicating principle, since the soma plant of India, alluded to in the Sanskrit Vedas (which some place as far back as 20 centuries B. and the juice of which yielded, by fer-mentation, an intoxicating liquor, is supposed to be a species of Asclepias.

The milkweed must have acquired

these intoxicating properties through change of soil and climate, since we are positive that they do not exist in the plant in this, its native country. We have watched bees gathering nectar from the flowers many a time, but we never observed that it had any intoxicating effect upon them, and we do not believe that any one has observed such a fact here.

Honey Show for Illinois. -Mrs. L. Harrison, Peoria, Ill., in the Prairie Farmer, thus appeals to the bee-keepers of Illinois to make a grand display at the next State Fair. It can, and ought to be done:

The State Fair is a great educator of the people, and we do not think it is appreciated as it should be. In what other way or place can a person gain so much useful information as here? The late fair at Peoria was grand, superb, magnificent. It is claimed that a million dollars' worth of implements were on the grounds, and the show of horses and cattle has seldom, if ever bein equaled. We consider the poultry show worth five dollars to see, and we felt like crowing as we viewed

and we felt like crowing as we viewed the thoroughbred fowls, pigeons, ferrets and rabbits in this class. They were a great source of amusement to young people, and will furnish food for thought during lonely hours.

The premiums offered for "farm products" was, for the most part, ample, and brought out a line display. When we first procured the premium list for 1881, we turned eagerly to see if the "bee" and its product had been remembered. In "farm products," lot 91, we found the following: Best lot of honey, not less than 10 lbs., \$5; lot 91, we found the following: Best lot of honey, not less than 10 lbs., \$5; 2d best, \$3. This is all that we could find any way connected with this great industry. Wax-work was remembered, but beeswax, always a staple, forgotten. In class 1., Natural History, lot 113, we find this: Best collection of insects, \$30; 2d best, \$15; and not a "red" offered for the "busy bee," one of the most useful.

We grundled at this state of af-

We grumbled at this state of af-fairs, and the officers of the associa-tion politely informed as that it was the bee-keepers own fault. If this is so, bee-keepers of Illinois, arouse! We are not all rheumatic, crippled, or

deaf and dumb.

The officers of the "Fair Association" recommend that you have tion" recommend that we have a called meeting of bee-keepers at Springfield at the same time as the meeting of the State Board of Agriculture, to take action on these mat-

Bee-keepers of Illinois, if this call is made will you respond? Every one of you that have for sale a bee or a tin whistle, it is for your interests that a big display is made. At the late meeting of the North American Becmeeting of the North American Bee-Keepers' Convention at Lexington, Ky., Mr. Jones, of Canada, gloried much over a big honey show that was held at Toronto this fall—a building over a hundred feet long devoted entirely to this industry. Are we going to be beaten by Canadians? Not a bit of it. Let us rout them by having at Peoria, Ill., next year, the biggest display ever held on the continent. We can do it if we have the gritof our forefathers and mothers. forefathers and mothers.

For the American Bee Journal.

#### Wintering Bees.

CH. DADANT.

In a friendly criticism of my essay on wintering bees, on page 275 of the BEE JOURNAL for Aug. 31, Mr. Heddon says: "Never before was I so struck with the difference in the ac-Never before was I so tions of bees and the treatment they require in different localities varying so little in latitude.

To my mind, there is no difference in the actions of bees on account of being located here or in Michigan; but there is a difference in the preparation of bees between Mr. Heddon and ourselves. As I said, the instinct of bees directs them to gather, in winter, directly below the sealed honey. If the bees at Mr. Heddon's do not act the same, it is on account of the two inches space that he leaves between the cushion and the top of the frames on his Langstroth hives. I cannot conceive what is the purpose of such an empty space. But such a space of 19x14x2 inches, or 566 cubic inches, is about equal to the entire space between the combs.

When the emblace.

When the cushion is directly above the frames, the heat generated by the bees is driven back between the combs. around the group, and warms it; while this empty space of Mr. Heddon's, amounting to 566 cubic inches, stores the heat arising from the bees but the bees, unable to generate an amount sufficient to fill it and at the same time the space between the combs, are compelled to scale the scaled honey in quest of heat, and to inhabit the empty space. Then the quilt, as Mr. Heddon says, seems to attract them.

Now as the first requisite in the

Attract them.

Now, as the first requisite in the management of bees is to comply, as much as possible, with their instinct, I advise Mr. Heddon to dispense with his unnecessary space, and he will see that his bees act exactly the same as ours

Heddon adds that bees are hardly as safe in a special depository, where the temperature is all the time at 42-, as they are out-of-doors, on account of their inability to pass between the ends of the frames and the tween the ends of the frames and the hive. I am of the same opinion. A special depository should be main-tained at 45, such at least is my expe-rience, and it is on account of the lower temperature that so many colonies were killed last spring in special de-

He thinks that bees can endure more than 5 or 6 weeks of confinement, some of his bees having been confined 5 months. I know that under some fa-vorable conditions all the colonies of an apiary can endure more than 5, and even 7 weeks of confinement, but such a result depends on so many different causes that it is better to have them confined for a shorter than for a longer time

Amongst a number of colonies some Amongst a number of colonies some have a strong population, while some are weak in numbers; some have too much unsealed honey, or honey of poor quality, such as honey dew, or honey stored in cells partly filled with pollen, or with juices of fruits. Does Mr. Heddon think that the colonies weak in numbers, or provided with honey of poor quality or watery, will analyze more than 1 or 5 weeks of consideration.

or 6 weeks during last winter, the number of the dead colonies would have been very small.

In writing 5 or 6 weeks as a long confinement, I had not in view the

strongest and best prepared colonies, but was giving my ideas of safe win-tering for all the colonies provided with bees and stores enough for winter, whatever be the quality of these provisions.

Mr. Heddon disapproves my idea of disturbing the bees in winter, when wintered outside, in order to give them a chance of voiding their intestines. He wants to leave his bees in a semi-dormant state during all winter, but the bees of Mr. Heddon are, no more than mine, in a semi-dormant state all winter, for he adds: "Ordinarily, many times during winter the sun strikes the hive with sufficient warmth to raise the temperature in the hive so that the bees can pass over and around the frames." In such case bees cease to be in a dormant state; they are active, and experience has proven to me that when the bees profit by such a temperature to empty their intestines, are better prepared for a new confinement.

confinement.

Of course, such a winter flight is not necessary when bees have been put in a suitable depository, for, in an equal and sufficient temperature bees eat less than when wintered out-of-doors. But I am persuaded that it is necessary, aspecially, with chaff hives especially with chaff hives, whose thick walls prevent the sun from warming the inside. Most of the col-onies which died last winter in chaff hives, would have been saved by this process.

As to putting bees in their winter depositories, I think that nobody will deny that it is better to put them in the cellar immediately after they have

the centrimmediately after they have enjoyed a good flight, than when their intestines are already partly filled, 1 would like to know on what Mr. Heddon bases his idea of the rearing of brood giving the dysentery to bees. Hamilton, Ill.

For the American Bee Journal.

## Bee-Keeping in Nebraska.

WM STOLLEY.

Lenclose 3 samples of plants; two of them represent excellent honey yielding plants, and the third is a va-riety of grass of which I also would like to learn the true name and its value.

No L is a flowering shrub or vine, which blooms from early spring till frost, and in dry seasons in particular, is very productive in honey yielding dowers. I took this plant with me to our State Fair, and consulted the beeour state ran, and consider the be-keepers there present, as to its true name, but all differed very much in opinion, and therefore 1 appeal from their verdict to Prof. Cook for a final judgment.

No. 2. is a very late flowering plant, and is represented by various varieties in this section of our State, and is eagerly sought for by bees, in fact, is our best honey producing plant late in the fall. I take it to be an aster, in the fall. but desire to be assured of it, or stand corrected.

commenced in the spring of 1880 4 commenced in the spring of 1880 with 2 weak colonies of black bees, increased recklessly to 8 colonies in the first season. I found that nearly all were very deficient in winter stores in the fall of 1880, some colonies having not more than about 5 lbs. of honey; when, after becoming a reader of the American Bee Journal, I learned a little of "what was indespensable" to winter safety. I feel sight a little of "what was indespensable" to winter safety. honey of poor quality or watery, will endure more than 1 or 5 weeks of confinement? I, for one, am sure that they will not.

Of course, all the strong colonies, provisioned with honey of first quality, will endure twice, even three times as long a confinement; but no bee-keepers, so far, has been able to get all his colonies in equally good condition.

Then we will see as good a bee-keeper as Mr. Heddon, lose 131 colonies out of 212. Of course, Mr. Heddon will concede that if his 133 colonies which perished had enjoyed a flight every 5

at pleasure. They were contracted by division boards and covered with nice woolen quilts over the trames, and the supers filled with chaff around the outside of the hive; about 12 inches was packed closely with chaff and straw, and then I shaded the entrance with a board. Thus my bees remained 106 and then a snared to consider a board. Thus my bees remained 106 days without a flight, and on Feb. 1, all but 2 colonies showed some signs of dysentery. On March 1, it being the first warm day since their confinement, I cleared away all the snow for the board of my has board for about 2 in front of my bee house for about feet wide, tore down the front wall, and opened the entrances of the hives fully. Soon the air was filled with bees, and I verily believe that this flight saved my bees. They all came through strong in number, compared with the condition they were in when they went into winter quarters. But they went into winter quarters. But the two queens which had been kept 16 days in October and November from their colonies, proved to be dead, and I had to unite them with other colonies colonies.

So I commenced the spring of 1881 So I commenced the spring of 1881 with 6 colonies; have, with the aid of 20 pounds of Dunham comb foundation, and 2 Italian and I Cyprian queen (bought from Rev. A. Salisbury), by means of artificial increase, now 14 colonies in the best of condition. Seven colonies are very heavy, and when they are contracted into proper space for wintering, considerable surplus will be taken from them, while my weakest colonies have plenty of my weakest colonies have plenty of stores to winter on.

I have come to the conclusion, that bees will do well, even in this part of Nebraska, if properly handled, and by the growing of melilot, borage, buckwheat and other suitable honey producing plants. I am convinced that apiculture here, will pay better than the growing of wheat and other grains. My Cyprian colony, so far, has done best of all. Their queen is by far the most prolific, and I have failed to find the Cyprians less amicable than my Italians; but my experience is too brief to be conclusive, and 1 will try them another season before I can speak intelligently.

I have sowed quite a variety of seeds for honey producing plants, and found borage (the seeds of which was sent borage (the seeds of which was sent me by the Agricultural department at Washington), to do exceedingly well. Ever since June up till date. Bo-rage is full of bloom, and bees are to be found on from early morning till

late in the evening.

Melilot, of which I have sown I acre. has come on well, and I am anxious to see how it will winter, and then turn out next summer. I find that my cat-tle have commenced to feed upon melilot, and would eat it clean if I would let them. The specimen, No. 1, which I have sent you for identification, does best on very high and dry laud; il is not injured by drouth, but on the contrary is benefitted by it after it is well certification, and they read the problem of the contrary is benefitted by it after it is well certificated and they righten invalidation. established, and then yields an abundance of honey, and is visited by bees every day and at all times during the day; but I do not know anything as to the quality of its honey. I think enough of it to plant at least 1 acre with this shrub this fall.

Grand Island, Neb.

[No. 1 is matrimony vine (Lycium vulgare); No. 2 is aster, and the grass, as Prof. Beal tells me, is Bromus ciliatus, a poor species of grass.—A. J. Cook.]

> For the American Bee Journal. Too-Early Brood Rearing.

> > O. O. POPPLETON.

I judge from what Mr. Kohnke says on page 339 of the BEE JOURNAL, that he has misunderstood Prof. Cook's remarks on how pollen is detrimental to bees in winter. I did not understand Prof. Cook to say that he thought "the presence of a large amount of pollen would induce bees to gluttony and cause sickness," but think he staand cause sickness," but think he stated as his opinion that such is not the case. His idea was that the presence of pollen was apt to induce bees to of the other headings. breed largely early in the season, and space is for writing the m that this too-early raising of brood was, in his opinion, a common cause of dysentery, followed, of course, by spring dwindling and loss, 1 do not attempt to give his exact words, but the above is a concise statement of his views as I understood them. If I understood him wrongly, the Professor

understood him wrongly, the Professor can easily correct me in the next issue of the JOURNAL.

I have lost so few colonies during the past 6 or 7 winters, that I have had little opportunity of observing how far pollen may be detrimental to bees, but I pay no attention to whether there are large or small amounts of pollen in the combs selected for wintering. I have noticed, however, that of late years my bees have not commenced brood rearing in earnest until the weather has been such that they menced brood rearing in earnest until
the weather has been such that they
could tly nearly every day, and I am
strongly inclined to the opinion that
Prof. Cook's idea of early brood rearing being one of the prime causes of
loss in wintering, is correct.
As I stated at the Convention, I do not
believe the loss of bees in winter cau.

believe the loss of bees in winter can be traced to any one cause. Of course the fewer causes of loss we have present with our bees, the more certain will we be of wintering safely, and I am glad Prof. Cook has called attention to the fact of too-early brood rearbeing one of those causes

Williamstown, Iowa, Oct. 28, 1881.

#### Apiary Record Book.

E. A. THOMAS.

There seems to be a much-felt want among bee-keepers, and a want which has hitherto never been met, and that is for a neat, tasty record book for the Cannot our friend, the editor of the Bee Journal, get us up such a book, neatly and durably bound with printed headings all ready for use? I am sure, from numerous correspondence on the subject, that such a book would meet with a ready sale among those who are desirous of improving or keeping up the standard of their bees. It should be in convenient form for carrying in the pocket, so that the apiarist can have it with him while at work and take it out, make an entry and return it again to his pocket without minding the time. Such a book must be used in order to be appreciated, and I am satisfied that no one, after having once used it, will be willing to give it up. For many years I have kept a careful record of every queen and colony in my apiary, using for that purpose a small memorandum book which I ruled and headed my-self. There are many advantages to be derived from keeping such a book, among the most important of which is the accuracy with which a queen showing any remarkable qualities may be traced, and the help it affords the bee-keeper in selecting and rear-

while examining a gentleman's bees last summer, my attention was called to a remarkably fine queen, and I inquired what stock she sprung

"Well," said he, "I really don't know; I wish I did, for I want to get some more queens of the same party.
"How old is she?"

"I can't tell you that, either."
"Don't you keep a record of the age

of your queens? Yes, I have intended to keep a record of them on the hives, but by changing hives, etc., they have got badly mixed."

Happening to have my book in my pocket, I showed and explained it to him, when he exclaimed:
"Why, I would give a good deal if I had such a record of my bees extending back 5 years or so."

tending back 5 years or so.

The following is a description of my book: Each number or stand occupies two opposite pages, and has two spaces at the left for dates, and then a wide space for any remarks which would not properly belong under any

The next space is for writing the number of the hive to which the queen is removed. either in a colony or for any purpose. The next is for writing the age of the queen, and the next two for the race of bees and the particular strain respectively. Then follows five narrow spectively. Then follows five narrow spaces headed respectively, Industry, Prolificness, Hardiness, Gentleness, Beauty. I use 400 as a standard and mark my queens by that, and I can tell in less than a minute just what a queen is and how valuable. This is what has enabled me to breed up my present superior strain of Italians.

I have given this brief description

I have given this brief description in order to draw out friendly criticism, as I do not doubt but that some of you may be able to suggest improvements. I think Mr. Newman can get up just such a book as we want, and if bee-keepers will use it, and base their reports upon it, we may arrive somewhere near the truth as regards the value of the different strains of bees.

My bees are all ready for their win-ter quarters, and in a few days we shall put them in. Having kept them breeding very late, they will go into winter quarters strong in bees and with plenty of good food. I know of with pienty of good food. J. Know of no reason why I cannot winter them as successfully as 1 did last winter. My Holy Land bees outstrip everything as breeders. I have one colony which has 5 good frames of scaled brood and larvæ, and several others which have 1 frames. which have 4 frames.
Coleraine, Mass., Nov. 1, 1881.

For the American Bee Journal.

#### Would it be an Honest Transaction?

WILLIAM CAHENS.

I notice the following editorial remarks in Gleanings for Oct., page 496;

"The Holy Land bees certainly have some strong points of difference that promise well. We often send them out to fill orders, and I have never yet heard them called anything else than nice Italians. The bees would please almost anybody in appearance, and we have never yet had a complaint of their being cross, like some of the lyprians.

Now are we to understand by the bove that, should we order from Mr. Root an Italian queen he is to send us not an Italian queen he is to send his just what he chooses, and it is all right so long as we do not know the difference? That is on a par with the dairyman who would ship a customer a tub of oleomargarine, and would console himself that the customer would not know the difference between that and good butter

## Bee Items from Maine.

S. H. HUTCHINSON.

I am a constant reader of the Weekly BEE JOURNAL. Bee-keepers of Maine, or at least those in this section, have not had very great success in obtaining a large crop of honey, but we have not entirely failed in this respect. We know nothing of the large yields We know nothing of the large yields of honey that bee-keepers report in other States, but what we do obtain we get a fair price for; we readily obtain 25 to 30 cents per pound for all the comb honey we can produce. So, if we do not get as many pounds, it is in some degree made up to us in price. Our bees buye done onto yell been Our bees have done quite well here this season. If we can obtain, say, 25 this season. If we can obtain, say, 25 lbs, of comb honey per colony and one good swarm, with plenty of good honey for winter, we feel satisfied. I find, by looking around among the neighboring bee-keepers, that the Italians and hybrids are the best off by far in the line of honey for winter. The blacks have done very poorly in this

section as a rule.

Those who like black bees can keep them, I want none in mine. For comb honey give me a good hybrid, from a pure Italian queen mated with a black drone. I have always had the best re-

sults with hybrids; in fact, I never had a very light-colored queen, purely mated, and whose bees were very yellow, that gave me a pound of honey in sections. I have had very dark Italians that done well in sections. How it would be with the extractor I am unable to say, as I have never used one. Extracted honey has no sale here, as long as comb honey is in the market. Perhaps if people could be brought to see that extracted honey is better and more healthy, it would be better for us all, as I am quite sure we could get more honey by the use of the extractor. I think I shall try it in a small way another season.

Mechanic Falls, Me., Oct. 24, 1881.

For the American Bee Journal.

#### Preparing Bees for Winter.

W. H. STOUT.

I have wintered my bees successfully for several seasons by preparing

them as follows:

Contract the brood chumber to 6 or 7 frames in which have 20 to 25 pounds honey, cut a hole of about 34 inch through each comb about 2 inches bethrough each comb about 2 inches below top bar, lay a stick about 8 inches long, % inch square across top of frames, cover with sheeting, woolen eloths or quilts, then an old sack of loose texture containing about a bushel of oat chaff pressed in close, then the cover or cap with a hole 1\(\frac{1}{2}\) inch bored at each gable end, and covered inside with wire cloth for ventilation with wire cloth for ventilation. Around the hive a box, about 6 inches space all around for packing, which is filled with out chaff and covered to prevent getting wet. For entrance, have a 5-inch bottomless trough 7 inches long, about 5 inches wide and 4 inches high inside.

My hives are mostly simplicity style 2 story, movable cap, frames, 10½x14 inches. I pack chaff about 6 inches higher than the brood chamber. During the winter I keep the snow from entrance, and on fair days I remove the cover from outside box and cap from hive, to dry the packing as the moisture passes through the chaff and settles on top like frost.

If the weather is mild enough, we take the bags with chaff off, and extake the bags with chaff off, and expose to sun and air until 'dry. This bad best be done only on days when the bees can fly, as to work around the hives will likely disturb them and break the cluster, which should be guarded against. I usually leave them packed until the weather is set. tled and the bees find some honey and

During warm days in March, I place rye and oats chopped together, where the bees can work at it in sheltered places, and they work at it quite readily. By this plan I have wintered successfully and had early swarms, while most bees around me were either dead or very weak the past season.

Pine Creek, Pa.

We consult the best good of our readers in recommending them to now secure the valuable and important in-formation and most interesting reading matter, including a thousand or more of pleasing and instructive en-gravings and sketches, that can be ob-tained at a triffing expense in the American Agriculturist. This is not merely a farm and garden journal, but is is very useful to every house keeper and to every household in village or country. It has an entertaining and useful department for the little ones. It is a journal that pays to take and read. Its constant, persistent exposures of humbugs and swindling schemes are worth far more than the cost of the paper. The 41st annual volume begins Jan. 1, but those subscribing now for 1882 get the rest of this year free. Terms: \$1.50 a year; four copies \$5 (English or German edition). Single copy, 15 cts.

The Texas State Bee-Keepers' Convention will be held at McKinney, Texas, on Tuesday, April 25, 1882.

### Kentucky State Convention.

SECOND DAY.

The committee on nominations recommended the following, who were elected by ballot:

President - Dr. N. P. Allen.
Secretary - Wm. Williamson.
Treasurer - J. B. Nall.
First Vice President - Dr. L. E. Brown.
County Vice Presidents - Dr. Dillard. Fayette;
H. H. Littel, Jefferson; Thos. Snyder, Logan; S.
Collins, Spencer; Dr. Keene, Woodford; Rev. L.
Johnson, Boene; W. P. Pelbam, Mason; Mr. Bartleson, Wayne; Dr. J. R. Larue, Bath; I. N. Green,
Barren; Alex. Sayers, Nelson; Jas. Erwin, Allen;
L. T. Mobberly, Hardin; J. D. Davis, Cumberland.

Dr. Allen, in taking the chair, after reelection, returned thanks and asked the Society to aid him in the work. He thought the people should be educated, and that there ought to be a society in every county. In this way only would people take an interest in bee-keeping. He said this State Society had grown out of a small beginner. bee-keeping. He said this state society had grown out of a small beginning at his residence, several years ago. He said men had learned to keep bees and produce honey simply by the interest taken in the Society. He hoped every Vice President would orward a local secrety in his country. ganize a local society in his county.

The following, by Dr. J. P. II.

#### Brown, of Georgia, was read on Marketing Honey.

Whether the production of an arti-cle is profitable or not, depends alto-gether upon the demand for it. The demand for an article is generally governed by its utility; how far it administers to the health, comfort and pleasure of the purchaser, and the extent it pampers to the fashion of society. The sale of an article is generally based upon its character, appearance or representation.

The successful and wide-awake mer-

chant grades his goods and puts them up in the most attractive form to please his customers. His salesmen also possess a knowledge of the qualities of the goods, and are able to represent to the customer the merits of the article offered for sale. Thanks the article offered for sale. Thanks to our apicultural literature and beekeepers' societies, our honey pro-ducers are generally learning how (as well as the necessity) to put up their product in a convenient and neat shape, observing all the conditions to have it clean and inviting in appear-ance. With many persons, this latter condition has more influence than prime quality.

In this short paper, we have no time to refer to all the particulars necessary to be observed in marketing honey. but shall only offer a few suggestions for the seller to think over, enlarge upon and modify to his particular

We believe there are but few places we beneve there are out few places where honey cannot find a market. Illustration: Dr. J., located in a small village in Middle Georgia, had been keeping bees for several years, more for pleasure than profit, but this season he concluded to run for profit, sead he found his dayen colonies of and he found his dozen colonies of bees paid him more money than did 2 acres in cotton. Before this he thought he could find no market for his honey, but after he put it up in nice shape and offered it for sale, he had no trouble to sell it at a fair price. Hence we believe it is always possible to build up and increase home markets. Such markets, as a general thing, are always the best-they save freights and commissions.

and commissions.

It often becomes necessary to consign our honey to commission merchants, or to ship to distant markets, etc. When this course is required, it should be put up in the best possible manner. If shipped in wooden vessels, they should not be larger than from they should not be larger than from 10 to 20 gallon kegs, and should be made out of the best material, so they will not leak. A barrel that will hold water may not hold honey, and hence such test is no guarantee of security. We prefer from 1 to 5-gallon square

tin cans, with tops and bottoms well soldered on. The top has a hole and collar to admit of an inch cork. If collar to admit of an inch cork. If necessary, this cork can be secured in with a coat of plaster of Paris on top, within the collar. When honey arrives in a leaky condition with everything smeared up, it generally goes to the cellar or back part of the store, to consign upsolds but when it is not up remain unsold; but when it is put up in convenient packages that are clean and nice, it is apt to be kept in front where people can see it. Commission merchants are often not as much to blame for low prices and slow sales as

the slovenly, careless shipper.

It must not be supposed that every grocery merchant is suitable to sell honey. There must be a natural fithoney. There must be a natural fitness for such business. Those who push their business by a judicious appush their business by a judicious application of printer's ink, and have a fancy business in the retail line, are the ones to select, particularily if backed by a reputation for honesty and reliability. It is best for the beekeepers of a neighborhood to center upon the same man, so as to offer him sufficient inducement to build up and settend the trade. By this course printer of the printer o extend the trade. By this course, prices can better be sustained and the market enlarged.

In many of the large cities there are

merchants who make the landling of honey a specialty. Most of these men are reliable, and always pay the market price. Atlanta, Ga.

Dr. L. E. Brown stated that he saw Dr. Drane's shipments. The barrels were coated with wax on the inside, and the extracted honey allowed to stand before barreling.

Mr. Demaree said it was not nec-

essary to wax the barrel, as soft wood barrels could be used. His plan was to allow his honey to stand in hot weather at least one week, when the honey is drawn from bottom. He pre-fers 100-lb. casks, or small glass jars for local trade. At first he could not for local trade. At first he could not sell extracted honey, but now cannot

supply the trade.

The report of the committee on supplies was received and read as fol-

Your committee have examined the supplies on exhibition, and desire to especially call attention to them:

to them:

Wn. Hamilton, Louisville, Ky., has observatory
nuclei of Cyprian bees and queens; foundation ma-chine; 6 cases of nice honey in 1 and 2-1b, sec-tions; (sbam sections glassed, and one-piece sec-

tions.

Dr. A. W. Kaye, of Pewee Valley, Ky., 1 and 2-lh.
unclassed dove-tailed sections of honey, brood
frames, frames for sections, and one-piece sections.

rrames, frames for sections, and one-piece sections.

Mr A. Schneider, Louisville, Kv., a beautiful display of extracted boney.

Mr. L. T. Mobberly, of Long Grove, Ky., exhibited a bottle of extracted boney from the narrow leaf or water oak, extracted late in September.

A display of foundation by Charles Badant & Son, Hamilton, Ill.

The AMERICAN BEE JOURNAL, Bee-Keepers' Manazine, Bee-Keepers' Guide, and Bee Keepers' Manazine, Bee-Keepers' Guide, and Bee Keepers' Instructor were on the table for free distribution. Your committee recommend that a vote of thanks be tendered to the able editor of the Farners' Home Journal for reporting and giving notices of this meeting.

Your committee recommend that all the members be requested to make a display of honey, bees, supplies, etc., at the next meeting of the Convention. A. Schneider, Louis Hofstetter, L. T. Mobberly, H. H. Littell, Committee.

#### ADULTERATION.

Mr. Littell said it should be the duty of members to use their influence to get a law prohibiting adulteration of honey, butter, etc. There is a law in this State, but it is not enforced, and

needs amendment.

Mr. Cook moved that the President

Mr. Cook moved that the Freshent appoint a committee to prepare a bill covering the ground.

Mr. Williamson said there was already a law in Kentucky making a penalty of \$50 for first offense, and \$100 for second offense. It was only necessary for members of this society the second that it is sufforced.

necessary for members of this society to see that it is enforced. Messrs. Demarce, Mobberly and Hofstetter thought there were so many difficulties in the way of executing the law that it would remain a dead letter, and that honey would sell on its own merits, and the name of the producer would be the best pro-

the producer would be the best protection honey could have.

The resolution was adopted and the President appointed G. W. Demaree, Chairman, W. Williamson and I. B.

person who shall give satisfactory evidence that he has succeeded in fertilizing queens in confinement. Adopted

Mr. G. W. Demaree read the following on

#### The Several Races of the Honey Bee-Their Relative Merits, Etc.

The honey bee has been in a state of domestication for thousands of years, and yet but little was known of the several races or varieties of this highly-prized insect until the past few This is not surprising to some years. This is not surprising to some of us who have lived to see the mighty revolution that has taken place in the way of increase of knowledge and improvements in all the affairs of men. It would seem that knowledge has It would seem that knowledge has been accumulating for ages to burst forth in these days like a new crea-

Of the honey bee (Apis melifica), there appears to be but the one species. This is proven by the fact that when the several races or varieties of the the several races of varieties of the species come in contact, hybridization is the result, and the hybrid queens are not only capable of producing progeny, but are exceedingly prolific.

While there is but the one species, this is divided into two distinct family the results of light.

tins is divided into two distinct families or races, viz: the yellow, or light-colored race, and the black, or dark-colored race. To what extent these two branches (the yellow and the black) of the great family of the honey bee has been effected by hybridization in the year is a problem to be solved. oee has been enected by hypormization in the past, is a problem to be solved by long and careful experimenting, as there is no history of the races of the past upon which to base a conclusion.

The German, or common black bee, is considered the great representative is considered the great representative of the dark races of bees. In a state of nature, it is, perhaps, the purest (in the sense of unmixed blood) race of bees in the world. No amount of skill will make them "sport," or show the outcropping of mixture of blood. It has been more generally cultivated in the past—if bees kept in "skeps," gums and boxes can be said to have been cultivated, than any other race of bees. This, however, is no evidence of the superiority of the race, but was owing to the energy and civibut was owing to the energy and civilization of the people who occupied the countries inhabited by these bees.

Although worthy of cultivation in Although worthy of cultivation in the absence of the superior races, the common black bee is inferior in many respects. They lack robustness of constitution, and therefore succumb to adversity. They fail to protect their comb against the ravages of the bee moth, when the least weak or discouraged, and at all times and under all circumstances they are fidgety and ignitiable in temperament. There is irritable in temperament. There is set down to their account one valuaset down to their account one valuable trait, and that is they produce whiter comb honey than the superior races do. This is owing to the fact, that in capping the honey cells, they lay on the wax more unsparingly, and the surface is whiter thereby, in the same way that a thick coat of white paint gives a whiter surface than a thinner one.

The Italian bee was first introduced.

The Italian bee was first introduced into this country about the year 1860, and though sold at first at fabulous and though sold at arst at monous prices, gained in favor rapidly, and has spread its influence throughout our vast domain. The Italian belongs to the yellow race of bees. To the beauty and docility of this race of bees we are indebted for the advanced state of hee science more than to any other of bee science more than to any other cause, except the inventive genius of the immortal Langstroth. The pure cause, except the inventive genius of the immortal Langstroth. The pure Italian bee has all the traits of perfection, superior length of tongue, is industrions, gentle, beautiful, powerful for strength and full of courage. Previous to the importation of the Italian, it was thought that the beemoths would finally externinate the honey bees in this country. But time and experience has shown that the fault was with the native bees rather than the increase of the bee moths. The Italian is abundantly proof against the bee moth, and has conquered a

The Cyprian bee was imported directly to this country from the Island of Cyprus, in the summer of 1880, by Mr. D. A. Jones, of Canada, than whom no apiarist has done more for whom no aparist has done more the bee-keeping interest, as an importer and breeder of bees. The Cyprians belong to the yellow race. Whatever may be said to the contrary, Whatever may be said to the contrary, they differ but little in appearance from the Italians, and what has been said of the latter race may truthfully be said of the Cyprians, except that they are not so quiet and pleasant to handle. Judging from my experience with these bees, I cannot but think that their fighting proclivities have been sadly exaggerated. I have handled them in my own apiary, and in the apiary of my friend, Dr. Rogers, of Shelbyville, Ky., who breeds from imported stock, and being a great adported stock, and being a great admirer of the Cyprians, keeps no other bees; and I say emphatically, that I can "handle them" without annoy-

The Palestine or Syrian bees were imported from the vicinity of Jerusa-lem, Bethlehem and Mount Lebanon by Mr. Jones in the spring and summer of 1880. Mr. Jones, in his enthusiasm as an importer of valuable races of bees, visited the "Bible Land" in person, and selected these bees from the several places named. They belong to the yellow race, and resemble the several places named. They belong to the yellow race, and resemble the Italians and Cyprians very much, though it is said that they are smaller in size. The queens are exceedingly prolitic, and are likely to be great swarmers. Of their working qualities I am unable to speak from experience, though I doubt not but that they have many good qualities.

though I donbt not but that they have many good qualities.

The coming bee will certainly be a cross between the Italian, Cyprian and Syrian bees. This must be so, as the legitimate result of the causes now at work. The Cyprians have been introduced in Italy, and are being bred in the same apiaries with the Italians in their native home. While the Syrian bees have been taken to the island of Cyprus, and all three of the races are being bred together all over this country. Who will be able to separate them? The gentleness and industry of the Italian, the robustness of the Cyprian, joined to the prolific, swift-Cyprian, joined to the prolific, swift-winged Syrian will give us the "coming bee," which will be the pride of bee," which will be the pride of American apiarist.

Christiansburg, Ky.

#### REPORTS OF VICE PRESIDENTS.

J. D. Davis, Cumberland Co., reported a heavy loss of bees last winter, a good honey crop this season, a large increase of colonies, and rich fall harvest. Bees are in good condition for winter.

I. N. Greer, Barren Co., reported a

flourishing county association; a short crop of honey, but bees in good condi-

tion for winter.

James Erwin, Allen Co., reported that the poor season last year, together with the unprecedentedy code that the poor season last year, together with the unprecedented year. gether with the unprecedentedly cold weather, was so disastrous in its results as to cool the ardor of tyros in bee-culture. Probably three-fourths of the bees in his section perished. His loss was comparatively nothing, as he had sold off most of his bees last fall. The honey harvest in this locality has been very moderate. We are ran. The noney harvest in this locality has been very moderate. We are having a rich fall harvest. Bees will go into winter quarters in excellent condition. His bees increased to double the number he had in the spring, and gave an average of 30 lbs. per colony

Mr. Williamson offered the follow-

ing:

Ing:

Resolved, That in order to educate the youth of our State and the country at large in the science of bee-culture, that we recommend to the President and board of directors of the tate Agricultural and Mechanical College, a department in apiculture, and that an apiary be established at the college grounds in Lexington; that lectures be given, and practical lessons in apiculture be given to the students; that a committee be appointed to confer with the President and directors of our State college.

The resolution was adopted, and the following committee appointed: Wm. Williamson, G. W. Demaree and Dr.

L. E. Brown.
Mr. Williamson offered the following, which was adopted:

Resolved, That the Farmers' Home Journal, of Louisville, be the official State organ, and that the bee-keepers of our State are requested for write reported papers from time to time to be published to said official organ, and that all are requested to subscribe for it.

The committee on resolutions offered the following, which were adopted:

the following, which were adopted:

Resolved, That the thanks of this association be tendered Col. Maximess and the managers of the Louisville Exposition for courtesies tendered the convention, and for the use of the press room to hold its sessions in. That the thanks of this seciety are due Col. I. B. Nell, editor of the Farmers Home Journal, tor publi-hing the programme and notices of the meeting in his valuable paper. That we appreciate the reports of bees and honey, as made by Commissioner Bowman, of the Bar an of Akriculture for Kentucky. And thanks are due to the city papers for publishing items of interest of Convention. To the officers of this society for their efforts to make this meeting both pleasant and the American Meeting both pleasant and the American Section of the recommend to farmers and producing trees, shrubs and plants for shade and promised purposes, and that we recommend to farmers and planting of such trees as linden, p-plar and map the planting of such trees as linden, p-plar and map the Sande frees, upon the farm and along the roadside.

Resolved, That we recommend to bee keepers the importance of preserving honey planting of such trees as linden, p-plar and map the Rentucky and southern Indiana to winter bees on the summer stands with blankets or light chaff cushions over the brood chamber.

On motion of Mr. Williamson, the

On motion of Mr. Williamson, the Central Bee-Keepers' Association was consolidated with this Association.

The next meeting will be held in Louisville, the executive committee to fix the time.

On motion, Mr. Wm. Cook was requested to write and publish in the Farmers' Home Journal an article on Who shall keep bees?"

On motion, it was requested that all

On motion, it was requested that all members of the Society add to the membership by getting the names and fees, and forward same to the treas-

The meeting adjourned, to meet at the call of the executive committee.

Read before the National Convention.

### Origin of our Present Races of Bees.

E. E. HASTY.

The configuration of the earth into continents or islands has played an important part in adjusting the present species of living creatures that dwell on the earth. In North America, for instance, we have a curious duplication of species, which is well exhibited in the different species of deer. We have two species of red deer, two species of black-tailed deer, two species of elk, and two species of reindeer. The key to this peculiarity seems to lie in the fact that in remote ages, our continent was divided into two continents, Canada and Colorado, with a shallow sea between them. Similar, but not quite identical species grew up on the two continents; and then when the Mississippi valley became dry land, and united the two continents into one, we were provided with a duplicate lot. The configuration of the earth into con-

nents into one, we were provided with a duplicate lot.

The Canadian species seem generally to have proved much more vigorous than the Coloradan, teaching us how the Canadian bee-keepers will "clean us all out" if we don't "mind our eye." The Canadian red deer has driven the Coloradan red deer almost into the Pacific; a limited territory around Acapulo, in Mexico, containing all there is left of the species. The Canadian black-tailed deer, retreating itself before the red deer, has driven the Coloradan black-tailed deer over the mountains into Oregon. The Canadian moose, however, not fond of prairies, has left the Coloradan elk pretty much undisturbed.

mountains into Oregon. The Calaman moose, however, not fond of prairies, has left the Coloradan elk pretty much undisturbed.

Turning now to the subject proper, we note that around the cradle of the human race in Armenia. Syria and Egypt, 3 great continents converge. It is not to be expected that each continent would have its characteristic bee. It is also presumable that along the border lines the three primitive races would, in different proportions, mingle with each other, forming in the process of time additional races. This is the gist of the present paper: The Caucasian, the Palestine, the Egyptian. the Cyprian and the Italian bees formed by varied crossings of the three primitive bees of Europe, Asia and Africa.

The primitive bee of Europe is the well known black or German bee, so familiar that we need not waste words upon it. The Asiatic bee we will assume (but not with entire confidence), to be the Apis Indica. Central Asia, like South Africa, seems to have been for long ages drying up, and changing to desert, and possibly the primitive bee we are looking for has become extinct, or nearly so. At any rate, we need not accept the Apis Indica, as Mr. Benton saw it in Ceylon. In that quarter of the globe, it may have been debased somewhat by crossing with Apis florea. A traveler (whose name I caunot at this moment give), lecturing before a

Sichigan society, gives us the best sight of our object. He states that the university of our object. He states that the university of the control of the co

total failure in his occupation; but should that discourage him? Should that make him give up a business for which he has been for same time per-fecting himself? and for which, per-haps, he is peculiarily adapted? No! Perseverance, dexterity and economy will bring us success in almost every legitimate business in which we en-

Gentlemen, one of the most important subjects for us to discuss is, "Over-stocking our range with bees." Can it be done? I say it can, with bees as well as with animals. I am well aware that during our sage and sumae harthat during our sage and sunae nar-vest it would require a large number of colonies to gather all the nectar from the millions of flowers that bloom in our mountains; but as this great flow of nectar does not continue very long, it is unwise to have more bees than can go on with brood-rearnees than can go on with brood-rearing after the sage, sumae and buck-wheat have ceased to bloom, or before they come in bloom. I think that it is admitted by some of our principal apiarists that a given point can be overstocked, and those that are fortunate enough to count their colonies by the hundreds divide them into some the hundreds, divide them into separate apiaries.

This season of drouth, though very hard on the majority of bee-keepers, will, I hope, teach us this—not to push our honey on the market all at once, but to hold for more remunerative

when it comes to the quality of honey, Southern Califorma need not blush to compare her honey with that which is produced in any other part of the world. It is acknowledged in all markets where it has been tried that California honey is unsurpassed. We have the quality, and on an average we have the quantity....

Having the best honey in the world, let us put it on the market in a good, neat and suitable package, thereby that and suitable package, thereby creating such a demand for our honey that the doleful cry of overstocking the market will be changed to the cheerful inquiry of, "How is the demand to be supplied?" To me, the future prospect of the California begravity in the property of the control of th keeper was never more promising than now. In the near future, apiculture will not be a game of chance as it has been in the past. A few good seasons and proper management will enable us to issue from darkness into light, therefore let us

Faint not! for to the steadfast soul Come wealth and honor and renown.

In looking over this assembly, I see but few of the fair sex. Why is it so? Are we all bachelors, or still worse, woman-haters? No! Most fervently woman-haters? No! Most fervently I hope that neither charge can be laid t our door. Let us in the future induce as many

ladies to attend as we can; also invite them to take part in our discussions. them to take part in our discussions. You all are aware that in England the President of the British Bee-Keepers' Association, Mrs. Burdette-Coutts Bartlett, is a lady whose fame is world-wide. In the United States, some of our best apparists are ladies. I am confident that by exerting ourselves, we could induce the ladies to grace our Conventions.

Before closing allowing to say that

Before closing, allow me to say that tis my great desire that peace and harmony may prevail during our Convention, and that the time spent here may be both profitable and pleasant, so that when the time comes for each one of us to go our different paths, we may have nothing to regret, but that we have to part.

The Michigan State Bee-Keepers' Association, will convene at Bat-tle Creek, on Thursday, Dec. 8, 1881. We have reason to expect one of the largest and most interesting meetings largest and most interesting meetings we have ever held. Let all arrange to be present. All District Associations should send delegates. Each person should come with their best experience in their hands, ready to hand it over to the others of the fraternity. Commutation rates are expected on railroads.

A. J. COOK, Pres. railroads. A. J. T. F. BINGHAM, Sec.

# SELECTIONS FROM

A Good Honey Crop.—This has been a good season for honey. I commenced the season with 12 colonies, and increased to 26, taking 2,400 lbs. of extracted and 576 lbs. of box honey of extracted and 576 lbs, of box honey, in all 2,976 lbs., being an average of 248 lbs., and they have plenty to winter on. I wintered my bees in the celar last winter, and lost but I colony out of 13; the others were strong. I think the cellar is the best place to winter bees. I have all hybrids now; I had two Italian changes but suring I had two Italian queens last spring that two trainar queens last spring, but they were lost in swarming. I like Italians best, and shall try them again.

H. J. Smith. again. 11. J. SMIT. Burlington, Wis., Oct. 27, 1881.

My Method of Wintering.—I have been requested to write my method of wintering bees for the BEE JOURNAL, wintering bees for the BEE JOURNAL, both by letter and through the JOURNAL. I would gladly do it if I could; it is more work to do it on paper so it could be understood than I can spare at this time. I have been sick for some time, and could not go to the National Convention on that account; I have not yet prepared our bees for winter, and it is now 17 days past the time we usually have it done. I always want it done by the 10th of this month. I do not know when I will be able to write it.

Mt. Healthy, O., Oct. 27, 1881.

Well Enough.—My bees did pretty well this year. Out of 2 colonies left in the spring, I now have 11 by divid-ing but one, and all in excellent coning but one, and all in excellent condition. I attribute their good condition to the fact that I fed them all summer with the honey left in the hives by the bees that perished last winter. They yielded about 450 lbs. of comb and 50 lbs. of extracted honey. be more favorable for our pets than the last.

Geo. Bischoff.

Burlington, Iowa, Nov. 1, 1881.

Poor Honey Crop.—I see by the report of honey crop for 1881, that you credit Massachusetts with 78 lbs. per colony. I think that you did not get many reports from the eastern part of the State, as I know of several hundred colonies that have not gathered as much as has been necessary to feed as much as has been necessary to feed in order to get them in condition for winter. I started with about 50 colonies in good condition in June, and would have obtained a good crop if there had been any chance. White clover yielded just enough to encourage breeding. I held them back until after July 4, when my hives were so full of bees that it was impossible to keen them from swarming any longer keep them from swarming any longer without considerable trouble, so I let them come. On Aug. 5, 6, I looked them all over and found them heavy with brood and bees, but not much honey, excepting in a few of my black colonies that had been working in surplus boxes. On Sept. I, many were in a starving condition, and had to be in a starving condition, and had to be fed. They made a little gain on golden rod, but not enough for winter, and I have fed them about 700 lbs. of honey and sugar, and doubled them down to 80 colonies, which puts them on winter footing. One man tells me has beefed 712 lbs. sugar, and another on winter footing. One man tells me he has fed 713 lbs. sugar, and another that he has fed several barrels.

WM. H. Gibbs.

Clinton, Mass., Oct. 29, 1881.

Short Crop. - I am now taking off my crop of honey, and find it quite short, perhaps owing to drouth and unprecodented hot weather. I shall have dented hot weather. I shall have about 100 lbs. of comb and 200 lbs. of about 100 lbs. of comb and 200 lbs. of extracted honey, and selling at 20c. per lb. I am much pleased with the BEE JOURNAL as it is, and will perhaps be more so with the improvements of next year. JACOB EMMONS.

St. George, Kans., Oct. 19, 1881.

Bees on Shares.—I intend to put my bees in the cellar for wintering. The cellar is a good one, but is under the kitchen, consequently there will be plenty of noise above them, but no jarring. 1. Will the noise injure the bees? 2. Suppose I sould purchase 10 or more good. Italian colonies in the carrier and give them out on shares. spring, and give them out on shares, what would be a fair divide in the fall of honey and bees? 3. In rearing queens in nuclei, can more than one at a time be reared; if so, how are they kept till sold or wanted for your own use? Please answer in the BEE JOURNAL. JOHN YODER. Springfield, Ont., Oct. 12, 1881.

11. The noise will not injure them if

there is no sudden jarring. 2. It is the custom, we believe, in running bees on shares, for A to furnish the stock of bees, and stand onehalf the expense for additional hives, sections, foundation, etc. B performs all the labor, boards the help, buys one-half the new hives, sections, etc., and does all the nailing. When the division takes place, A receives the same number of colonies originally furnished, with one-half the increase honey, and accumulated property for which he has helped to pay. This answer applies also to the queries of Dickson Bros., Lancaster, Ont.

3. You can only rear one queen at a time in a nucleus, and she should be kept in the nucleus until wanted. The nucleus should be enlarged from time to time as required.—ED.1

Sawdust for Wintering Bees.—My plan will winter bees safely anywhere without loss, and the bees will swarm as early as April. The plan is to bury them in sawdust; set two rows of hives backs to backs, and side by side close as you can get them; let them range as you can get them; let them range in a row from north-north-east to south-south-west, so as to give both sides an equal share of the sun. It is 9 o'clock before it gets warm enough for bees to fly; three hives can front to the south but more them. to the south, but none toward the north; then have a tight board wall north; then have a tight board wall all around, and expose the entrance of every hive below to give the bees a chance to fly at will; fix them away before they suffer with cold; leaves and earth will do where sawdust cannot be had. The sawdust can be damp but must not be wet. Cram the sawdust as tight as you can get it; the thickness of the wall should depend upon the latitude you live in. The sawdust is generally of such a warm upon the latitude you live in. The sawdust is generally of such a warm nature that it will heat toward spring. nature that it will heat toward spring, and if not, take it allout in the spring at the time you want them to commence rearing brood, and put a case around the sides of the hives, leaving only one inch space between the case and the hives, in this space put wheat brain, and the sawdust in the large space; moisten all slightly, and crain it as tight as you can get it, then draw ont the case—so the sawdust and brain will connect; then put brain on the top of the hives one inch thick, and all of the hives one inch thick, and all the sawdust over them again; tramp it tight, and cover well to keep out the rain. Sponts can be put through the sawdust to connect with a feeder, to feed early in spring. Leave them in till frosts are past, so as not to chill the brood, and I will insure your bees will come out three times as strong, and you will winterbees no other way as long as you live.
CHARLES J. LOHMANN.

Cameron, Mo., Oct. 28, 1881.

A Light Yield.—I have now 40 colonies all told; I had 30 in the spring; have not taken any honey from the new colonies, while the old ones will average about 39 lbs. Honey is about all sold in this county. I have an order now for 500 lbs. from one hotel in this town, and have all sold out

Queeche, Vt., Oct. 18, 1881.

Good Honey Season.—The season, just closed, has been a very good one for bee-keepers in this section. The spring opened late, but very tine. The soft maple yielding better than usand the weather was so that the and the weather was so fine that the bees could work nearly every day it was in bloom; the wild willows also yielded well, and were followed by the white willow which yielded unusually well, so much so, that my strongest colonies filled and capped over combs from this alone. The queens, determined not to be outdone, filled the mined not to be outdone, filled the combs with eggs very fast, and our colonies were soon very strong. Gooseberries, currants, plums, cherries and apples followed—raspberries yielded well. These were next followed by white clover bloom which lowed by white clover bloom which lasted nearly 2 months, giving a magnificient yield. Basswood yielded honey for only about one week, falling short of its usual yield by more than 50 per cent. The drouth commenced early in July, yet buckwheat and wild flowers yielded well, so that the bees kept breeding and storing a surplus up to the close of the drouth. Showers early in September, brightened the honey yielding flowers, so that the ers early in September, brightened the honey yielding flowers, so that the bees stored more liberally until the night of Oct. 18, at which time we had our first frost. Our number of colonies now stand 8 to 1 in the spring. Our surplus is over 50 lbs. per colony at the opening of the honey season. Our bees close the season very strong in numbers and with good sumby of on pees close the season very strong in numbers and with good supply of well-ripened honey. I can see no reason why they should not winter well, if properly cared for, by being protected from a cold winter, should one follow. Brother bee-keepers! Our bees have done nobly for us this sea-son. Let us do our best to make them comfortable during winter. Successful wintering means nothing less than successful bee-keeping. It is so with me at least. F. A. SNELL.

Milledgeville, Ill., Oct. 31, 1881.

Honey from Golden Honey Plant. - In arranging my hives for winter, I found two full boxes of honey on one that was made from the golden honey plant, the balance made from it by the other colonies was sold some time since. The boxes were put on about Aug. 10, and the honey will be found nearly or quite pure. It is so peculiar in its flavor, and possesses other characteristic, and possesses other characteristics. tics so different from any other kind of honey that I have tasted, that I bave concluded to express a box to you that you may try it and give your opinion of it to the readers of the BEE JOUR-NAL. The box having been on the hive some time is somewhat soiled, but it will give you an idea of its taste. Watts' Chemistry, vol. 3, page 165, says: "The honey of the common bee says: "The noney or the committee contains cane sugar, inverted sugar, of dowtro-glucose. The and an excess of dextro-glucose. proportion of cane sugar varies with the age of the honey, as it is gradually converted into inverted sugar by the action of a ferment contained in the honey." I do not know that there has ever been a test of the different kinds ever been a test of the different kinds of honey, to determine the relative quantity of cane sugar they may con-tain, but I should judge, from the taste, that the honey gathered from the golden honey plant contains a larger percentage of cane sugar than either white clover or basswood honey. There is another point in this connection, and that is, that the kind of honey containing the largest percentage of cane sugar may prove the best to win-ter bees upon. G. L. Tinker, M. D. New Philadelphia, O., Oct. 28, 1881.

[The sample section mentioned arrived in a dilapidated condition. The honey is of an amber color, and possesses a peculiar, rich, aromatic flavor.—ED.]

Just Splendid Report. - I had 5 colonies in the spring; lost none last winter; have increased to 26 colonies and obtained 1,100 lbs. of honey, 400 pounds of it being comb in 1-lb. sections.

I. G. TAYLOR.

Austin, Tex., Oct. 31, 1881.

What Killed Her ?-Some six weeks ago I received a two-frame nucleus, with a three-dollar queen in it. I put them In a hive; all was lovely; bees worked, reared brood, carried honey, etc. A few days ago, as I came to the hive, my choice queen was lying about two feet from it, in company with a yellow-jacket. I drove away the yellow-jacket, but my queen was dead. I was in the habit of feeding on top of the frames; is it possible that a yellow-jacket got into the hive and killed the queen, while the hive was open? The queen had some milky liquid on her head and body, and I think had lost her sting. Answer through the BEE JOURNAL.

J. H. KOOKER. Winterburn, Pa.

[We do not think the yellow-jacket killed the queen; and if it had, it did not carry her out. The yellow-jacket was probably attracted to the dead queen outside by the sense of smell. If you look through the bees carefully you may find the mystery explained by the presence of another queen, which has killed your pet.—ED.]

Prepared for Winter.—On the 10th inst. I weighted my 21 hives; they showed 11 to 18½ lbs. each of bees and honey, and on the 24th I wrapped rags on top and between the division boards, and left them on the summer stands to remain during the coming stands to remain during the coming stands to remain during the coming winter. I have 5 colonies of Italians, 2 of Syrians and 14 of blacks; 5 of their queens are old, but I hope they will keep their families together till spring, when I will supersede them. The drouth was broken up here on the 30th Sept., by heavy rain, which has continued at intervals ever since until continued at intervals ever since until
the last 3 days, making the creeks and
lowlands all overflow. The destruction to corn, bay and other property
will amount to many thousands of dollars in this part of the country. We
have had no frost yet to hurt anything.
The heavy rains ruined the late bee
pasturage, although the buckwheat is
now blooming and to day is clear and now blooming, and to-day is clear and warm, at 82. Bees are working on the buckwheat, and the disgusted farmers are sowing and harrowing in the mers are sowing and narrowing in the winter wheat crop in a hurry, to beat the next shower. The young white clover is booming for next year's crop here. I have sown two acres of melilot clover, and half an acre of golden honey plant. R. M. Osborn, Kane, Ill., Oct. 26, 1881.

Bees Starved.—I have 10 colonies of bees; they were very weak in the spring, and have not gathered enough to keep them. I fed them in July and August, and Sept. 20th three colonies left their hives and went away. I then examined the hives; they were full of combs, but no honey. The bees were starved out. I then commenced feeding what were left. They are doing well now, and if the weather keeps fine for a few days longer, they will probably have a winter's supply. The weather was very dry here, we being 44 days without rain. This is my first year at bee-keeping, and I have learned year at bee-keeping, and I have learned several lessons so far—some that I will not forget. I find that I have many more to learn. I wish the AMERICAN BEE JOURNAL much success.

JOHN C. BURNS.

Terre Haute, Ind., Oct. 25, 1881.

### CLUBBING LIST FOR 1882.

We supply the Weekly American Bee Jouroal and any of the following periodicals, for 1882, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

Publishers' Price. Club. The Weekly Bee.lonrnal (T.G.Newman) \$\frac{2}{2} 00... The 4 above-named papers. 4 50, 4 00

## Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

lacksquare When changing a postoffice address, mention the old as well as the new address.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Constitutions and By-Laws for Associations \$2.00 per 100. The local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

An Agreeable Dressing for the Hair, that will stop its falling, has been long sought for. Parker's Hair Balsam, distinguished for its purity, fully supplies this want.

44w4

A Sample Copy of the Weekly Bee Journal will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to payexpense of collecting them. expense of collecting them.

Preminms.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the JOURNAL for a year free. It will pay to devote a few hours to the BEE JOURNAL.

Women are Everywhere Using and recommending Parker's Ginger Tonic, because they have learned from experience that it speedily overcomes despondency, indigestion, pain or weakness in the back and kidneys, and other troubles peculiar to the sex.-Home Journal. See adv. 44w4

It would save us much trouble if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—
Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list.

Why suffer such unspeakable tortures? Rheumatism has been conquered. Kendall's Spavin Cure is the victor. See advertisement. 44

The Weekly Bee Journal, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be snpplied free, in any quantity they may be able to judiciously use.

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, & Monday, 10 a. m., Nov. 7, 1881.

The following are the latest quotations for honey and beeswax received up to this hour:

HONEY—The market is lively and prices steady We quote light comb honey, in single comb boxes, 18621c; in larger boxes 2c. less. Extracted

BEESWAX - Prime quality, 18@22c. AL. H. NEWMAN, 972 W. Madison St.

#### NEW YORK.

HONEY—The supply is full, and trade is lively. We quote as follows: White comb, in small oxes, 1802/2c; dark, in small boxes, 1502/1c. Exacted, white, 1000/1c; dark, 7609c. BEESWAX—Prime quality, 21/40023c. Thorn & Co., 11 and 13 Devoe avenue.

#### ST. LOUIS.

HONEY.—Steady. Comb 186620c, strained, and extracted, 96/124c.—top flaures for choice bright in fancy packages. On The sday was effected the remarkably large sale of 19,000 lbs. strained and extracted (in bibs.) at 95.

BEESWAX—Selling lightly at 19620c.

R. C. GREER & Co., 117 N. Main Street.

### CINCINNATI.

HONEY—Is in good demand here now.
I quote: Good comb honey, in sections, is worth
s@20c., on arrival. Extracted, 7@9c. on arrival.
BEESWAX.—18@22c., on arrival. I have paid
5c, per lb. for choice lots.
C. F. MUTH.

#### BOSTON.

HONEY.-1-pound combs are a desirable package in our market, and a large quantity could be old at 20022c, according to quality.

BEESWAX-P ime quality, 25c.

CROCKER & BLAKE, 57 Chatham Street.

#### BALTIMORE.

HONEY.-But little on the market, and prices are not quoted. BEESWAX.-Southern, pure 21@23c.; Western, pure 21@23c.; grease wax, 11c.-Baltimore Market Journal.

#### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb. sections, 22@25e.— Indianapolis Stock Review.

#### PHILADELPHIA.

HONEY.-The supply and demand are alike nominal. BEESWAX — Best fight 23@25c,—Philadelphia Merchants' Guide.

#### CLEVELAND.

HONEY-We report the market quite active; all our sales this week of comb boney in I pound sections have been made at 22c, and two pound sections at 23c. Extracted has taken a start, and we report trade quite active in small packages, 30-pound tin cams, especially, at 12c, per lb. Extracted in bbls, continues dul.

BEESWAX-200622C.

EXEMPT. 115 Outgrie Street.

-2060226. A. C. Kendel, 115 Ontario Street.

### SAN FRANCISCO.

HONEY—Retail sales are being made within ranke of quotations. Wholesale buyers give offerings little or no attention.

We quote white comb, 19820c.; dark to good, 106, 146. Extracted, choice to extra white, 9810c.; dark and candied, 7888c. BEESWAX—23825c. STEARNS & SMITH, 123 Front Street.

18 In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Subscriptions may commence with the first number of any month in the year.

Premiums. - Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2,-a copy of "Bees and Honey."

3,—an Emerson Binder for 1882.

4,—Cook'a (Bee) Manual, paper.

5,— eloth.

6,-Weekly Bee Journal for 1 year.

Or they deduct 10 per cent in cash for their labor in getting up the club.

### Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among burn-ers, mechanics, professional and basiness men-and is, therefore, the best advertising medium.

# SEEDS FOR Honey Plants.

I keep at all times a full supply of Seeds for Honey Plants, including

Melilot Clover, White Clover, Alsike Clover,

Mammoth Mignonette, &c.

### Golden Honey Plant.

I have procured a limited quantity of the Seed of this new Honey Plant so highly spoken of by Dr. G. L. Tinker, on page 307 of the JOURNAL.

It may be sown broadcast in early spring or drilled in. The rows may be two or three feet apart and the seeds only a few inches apart in the rows. It will bear to grow very thick or if scattered will grow larger and throw up more stakes.

Price, 80 cents per pound. If sent by mall, add 20 cents per pound for postage.

Send for my catalogue which gives prices and instructions for plantingsent free upon application.

ALFRED H. NEWMAN,

972 West Madison St.,

# The Bee-Keeper's Guide;

### MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Aparry, enlarged and eleganity illustrated. The first edition of 3,000 copies was exhausted in about 18 months - a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and perproduced with great care, patient study and per-sistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings— the products of the Honey Bee; the races of bees; full descriptions of honey producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apary. This work is a masterly production, and one that

no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value. -L'Apiculture, Paris.

I think Cook's Manual is the best of our American works.-Lewis T. Col.RY.

It appears to have cut the ground from under future book-makers.—Br(t) h Bee Journal.

fature book-makers.—British Bee Journal.

Prof. Cook's valuable Mannal has been my constant guide in my operations and successful management of the aparty.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Mannal of the Apiary than from any other book.—E. II. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—Mich. Far.

it, will ever regret having purchased.—Mich. Far. Is a masterly production, and one that no beekeeper, however limited his means, can afford to do without.—Nebraska Farmer.

To all, who wish to engage in bee-entlure, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Heratal, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—Will VAN ANTWERP, M. D.

It is the latest book on the bee, and trents of both

III.—WM. VAN ANTWERP, M. D.
II is the latest book on the bee, and treats of both the bee and inves, with their implements. It is of value to all bee-radsers.—Ky, Live Stock Record.
It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—L'ABBE DU BOIS, editor of the Bulletin D'Apiculteur, France.

It is a credit to the anthor as well the publisher. I have never yet mot with a work either French or foreign, which I like so much.—DABHE DB Bots, editor of the Bulten D'Apiculteur, France. It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, und an extended R. In of the enemies of bees.—Democraft, Flusski, N. Y.

We have perused with great pleusure this wide mercun of the bee-keeper. It is replete with the best information on everything belonding to aptention. To all taking an interest pleusure this wide mercun of the bee-keeper. It is replete with the best information on everything belonding to aptention. To all taking an interest with the best information on everything belonding to aptention. To all taking an interest with the best most complete and practical treatise on the editing the most complete and practical treatise on bee-withing the most complete and practical to every nanateur in bee-culture. It is bandsomely printed, nearly bound, and is a credit to the West.—Western Apriculturist.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which to the West.—Western Apriculturist.

This work is undoubtedly the most complete manual recent published. It gives a full explanation regarding the care and management of the aparry. There is no subject relating to the culture of bees left unbouched, and in the complation of the work Prot. Cook has had the advantage of all the previous knowlede of apairists, which he uses admirably to promote and make popular this most interesting of allocations.—American Inventor

It may safely be pronounced the most complete and comprehensive of the several manuals which have recently appeared on the subject of bee

PRICE-Bound in cloth, \$1.25; in paper cover, \$1.00, by mail prepaid. Published by

Entered at Chicago post office as second class matter.

### Novice and Glucose.

Mr. A. I. Root copied the following item into Gleanings for November, page 530, from the BEE JOURNAL of Oct. 26, page 337:

To prohibit the use of glucose by law would be about as proper as to compel hotel keepers to use first-class, mean in hash, or cheap boarding-house keepers to depolitate the butter. If persons wish to any and ent glucose, they have a right to do so; we would throw no obstacle in the way of buying it. But we do object to their having and enting it for pure honey and syrap, or noything except what it really is. If buyers inquire tor glucose, let them have it; if for honey, sell them honey.

Whereupon he remarks editorially as follows:

" Now, if that is not exactly where I have always stood in the matter, it must be I do not see things straight. It looks to me just as if friend Newman thooks to me just as it then down and come over to my justion; but very likely it seems to him I have gone over to his side. Never mind, so long as we are agreed."

It is very certain that Mr. Root does not "see things straight," as he terms it The Bee Journal has been very outspoken in regard to adulteration. and has strongly condemned the use of glucose not only for adulterating honey, but also for feeding bees, while Gleanings has not only advocated its use for feeding bees, and sold it, by tons, for that and any other purpose the buyers wished to use it, but Mr. Root has aided adulterators by avowing that it was a "pure sweet," "not bad confectionery," that it was "excellent food," and that "basswood of the confectionery," that it was "excellent food," and that "basswood of the confectionery of the confectionery of the confectionery of the confectionery of the confectionery of the confection

or clover honey" would be "improved for table use by being mixed with the first quality of glucose!

Can it be possible that Mr. Root can honestly think, even for a moment, that the BEE JOURNAL has "come over to my position," as he states in the last number of Gleanings? The idea is simply infamous!

We have no desire to color his language, nor misrepresent his views, extracts from Gleanings, in proof of the assertions we have made. Mr. A. L. Root says:

"It seems as if the Buffalo factory improved on every ton of sugar (glu-cose) they send us. It is now so white and of such a pure sweet that it is not bad confectionery, just as it is broken out of the barrels. Both in appearance and taste, it is slowly but surely coming nearer and nearer to very white pure candied honey. If the flavor of basswood or clover honey were added to it, and its candying 1880, page 118.

Speaking of a jar with a small piece of comb honey inserted in liquid (mostly glucose) sent him as a specimen of adulterated honey, he says:

"If I had purchased the honey, I am sore I should have been well satsfied with it, although the contents of the comb were different from the liquid portion, and none of it was erystallized. This was by no means a proof that all was not pure honey, but whether it was or not I should pronounce it both good and wholesome. A pure article of glucose is excellent food, and we should like it just as well as honey, did it not lack the flavor of the flowers!" He then adds: "I really flowers!" He then adds: "I really think strong basswood honey is improved for table use by being mixed with the first quality of glucose. It is, I am sure, just as wholesome as honey."—Gleanings for April, 1878, page 110.

Of the adulterated honey Mr. Root says: "I am sure it is just as whole-some as honey." Can be point to a single sentence in the BEE JOURNAL that can be so construed as to give the idea that in such a sentiment "we are agreed?" If not, then he has done us a very serious injustice to say that we are agreed, unless he is ready to repudiate his own language.

He still further asserts that he has been eating it for months, aye, years, and here is the proof:

"The light yellow grape sugar that

would in eating the corn meal from which it is made."—Gleanings for Nov., 1878, page 365.

And in his catalogue of supplies for the apiary, on page 14, he says:

"I know that the Davenport grape sugar is good and wholesome, for 1 have used it for years."

Has the Bee Journal ever said that glucose or grape sugar was "just as good as honey," for any purpose? and will therefore give the following | Certainly not; but Mr. Root, editor of Gleanings has said so, and, therefore, we are not agreed, unless Mr. Root has changed his views! He says:

"For comb building, brood and queen rearing, during a dearth of honey, it is an excellent and cheap substitute for either honey or sugar." In the same article he says: "So far as I know" it is "just as good as -Gleanings for Nov., 1878, page honey."-

As still another proof that Mr. Root does "not see things straight," he conproperty corrected a little, it would be almost, if not quite, honey made from Indian corn."—Glomings for March, adulterating honey." This is his landary and the statement of t tradicts himself point blank by saying adulterating honey." This is his langnage:

> "I do not think it (grape sugar) could ever be used to adulterate honey without utterly ruining it for table use."—Gleanings for March, 1878, page

87.
"I have favored the use of grape sugar for feeding bees, and nothing more. I have done this with the miderstanding that grape sugar cannot be used for adulterating honey; its bitter taste would render this impossible, aside from its invariable habit of hardening in the cells almost immediately after it is fed to the bees." -Gleanings for Feb., 1879, page 41.

In the last paragraph he again contradicts himself. He has said he has been eating it, and knows it is "good and wholesome," that honey would be improved by being mixed with grape sugar, and that the adulterated honey was " both good and wholesome," and now in the last paragraphs quoted he says that "grape sugar cannot be used for adulterating honey," and that he has "favored the use of grape sugar for feeding bees and nothing more!

If a witness in court should thus contradict his testimony, he would be committed for perjury or be adjudged insane, and his evidence be ignored by the jury; but of course we shall not say such an unkind thing of Mr. Root.

It will be remembered that Messrs. Dadant and Muth, in several articles in the BEE JOURNAL for 1878, very

but, for all that, I think him very much mistaken. I have eaten it in large quantities just as I would maple sugar, and have fed it to our bees for over a year, without a single bad feature showing itself, so far as I know. It has been used largely all over our land, and is now quite an article of commerce. I do not know what kind of grape sugar they used in France, but I am sure that that made by the Davenport Glucose Co. is wholesome Davenport Glucose Co. is wholesome and free from the impurities mentioned... No doubt friends Dadant, Muth and, perhaps, Newman too, are sincere. I cheerfully forgive them all."—Gleanings for Oct., 1878, page 326.

In the BEE JOURNAL for July 13, the Rev. L. L. Langstroth gave a masterly rebuke to Mr. Root for advising the use of grape sugar for feeding bees, and for winter stores, showing that it was certain death to them. This convincing argument caused Mr. Root to confess as follows:

"The first experiment I ever made with it (grape sugar) for wintering, caused the death of two colonies..... They did not have the dysentery simply starved on heavy combs of solid grape sugar.

Mr. Root then agreed to discontinue his advice to use it for wintering purposes, and it is very generous in him to forgive us all for our efforts to convert him—but it is exceedingly ungenerous for him now to say that we have come over" to his "position."

Here is a matter that concerns every bee-keeper. Mr. Root makes the following libellous assertion:

"Grape sugar is now almost as staple an article with bee-keepers as foundation."—Gleanings for May, 1880, page 230.

Staple for what? It cannot be for feeding, because Mr. Root says his bees "simply starved on heavy combs of solid grape sugar." But one inference can be drawn by the general public, and that is that bee-keepers have been persuaded by the reckless assertions that grape sugar is "pure," "wholesome," "a pure sweet," "just as good as honey," and that "basswood honey is improved for table use by being mixed with the first quality of grape sugar," and "just as wholesome as honey." Can it be wondered at, that Mr. Root's own words are frequently quoted by glucose peddlers, to establish a prejudice against honest bee-keepers? Is it a matter of surprise, that the uneducated consumers always regard extracted honey with suspicion? Who is most guilty, the the honest consumer? Do not the above extracts explain why the commercial value of pure extracted honey is quoted at 8(a9c.), while the same article in the comb sells for more than double? Why is it that in Europe prices are nearly equal, unless because such immoral counsels have not been impressed upon the public mind?

Never have we comiseled the sale or use of glucose for any purpose whatever, neither directly nor by implication; but, on the contrary, our protests against its use have been frequent and unqualified. We have sacrificed selfinterest in our opposition to adulterations, and suffered much censure, but the most grievous injury we have yet received was from Mr. A. I. Root, who, with his grape sugar record before the public, unretracted, says "we are agreed."

### The Queen-Breeders of Italy.

On another page a correspondent remarks as follows:

"I confidently expect to find that 'coming bee' by following this very strain (his own breed of bees); at least I have more confidence than in send ing to Italy for a queen to breed from that was reared by an ignorant peas ant for no other purpose than to sell."

While we believe that America, will produce the "bee of the future," we emphatically dissent from the assertion that the queen-breeders of Italy are ignorant peasants. From personal observation, and intercourse with them by letter and otherwise, we know that they are intelligent apiarists. The main reason why we cannot expect the Italians to produce "the coming bee" is because they are more ease-loving than pains-taking; and are too much wedded to old-fogy notions, to accept the progressive ideas of our day. Many of them, however, realize the necessity of progression, and are doing all they can to impress these ideas upon all Italian queen-breeders are by no means ignorant.

Controversial.—As we take our last look over this Journal before closing the forms, we notice that it is quite controversial. We have a debate with Novice; James Heddon with E. L. Briggs; W. F. Clarke with James Heddon, and E. A. Thomas with G. M. Doolittle. This is the way to bring out the truth on every subject. To exchange error for truth should be our constant aim. In order to arrive at and settle down upon correct principles, we must debate every inch of the ground. The one who advocated the unsound philosophy is as much benefited by the general result as the one who comes off victorious. This is a good motto: "First pure, then peaceable.

Fragrant.-Mr. Julius Tomlinson. of Allegan, Mich., has sent us under date of November 10th, a very fragrant little bouquet of sweet clover blossoms. He writes: "My bees were bringing in pollen later than the 1st."

It will pay to devote a few hours in getting up a club for the Bee Jour-NAL. Read the list of premiums on another page, and take advantage of the fall gatherings to get up clubs.

### Vennor's Weather Predictions.

We have received a copy of Vennor's Weather Almanac for 1882. It is replete with valuable information in addition to the predictions for the different mouths for next year, and is sold at the low price of 25 cents. It contains 82 pages. We copy the predictions for the last two months of the present year. They are as follows:

November, 1881, will probably enter coid and decidedly wet, but this condition will suddenly, after the first week, give place to open and genial week, give place to open and genial weather again nearly everywhere, with a disappearance of trosts even in Northern New York and Canada for a marked period. We may expect some of the finest—at any rate, most enjoyable—weather of the season during this month at New York, Boston, Philadelphia and Washington, and in Canada our "Indian summer." In western sections the fore and latter portions of the month are likely to be disagreeable, but I do not anticipate much trouble from snowfalls or blockades this winter until December. Should such occur, however, it will inkely be found that the dates of the disturbances will be very nearly the disturbances will be very nearly the same as those of the Xovember of 1880. Possibly there may be a period of musual warmth in proximity to the

middle of the month.

There will be late fall-ploughing in Western Canada and in the Northwest, but in the last week of November a sudden and very severe fall of temperature will occur generally through Canada, with but little snow, if any, on the ground.

This month will be marked by periods of balmy and brilliant autumn weather, as in the year 1877.

December, 1881, 1 hardly like the look of this month, viewed from the present standpoint (Sept. 18). It "looks ugly," and smacks of cold, bitter, bring cold, north and south, east out west, west, ware law surgedy snow. and west, with but sparsely snow-covered ground in Northorn New York and Canada, and bare ground west and south. The month bids fair west and south. The month ones can to be cold and dry, rather than otherwise, and this cold may be somewhat proportionate to the heat of the past summer, and extend to extreme south. ern and western points. The entry of the month is likely to bring in winter abruptly in most sections where win-ter is usually expected and expersenced. The first week of the month will probably give the first good snow alls of the season in New York, Canadis, and westward, with considerable bluster, while cold, stormy, and wet weather will be experienced in southern localities. Snowfalls will again occur about the middle of the month m Canada and the Northern United states, and during the last few days of Washington, D. C., where it is probable the new year will enter with fair sleighing for a brief period. These snowfalls, however, are not likely to be as marked and severe as those of the next winter. Into as I laya already the past winter; but, as I have already stated, the "cold dips" look formidable in most sections.

My general impressions respecting the winter of 1881-82 at the present time (Sept. 25) point to some very open and balmy periods of considerable duration toward midwinter; early and intense cold at the setting-in of the season, and again toward and in season, and again found and in March; a rather backward and wet spring, and cool, wet summer, with but few very hot periods.

TO One of the latest caprices of of Madam Fashion is a bee composed of diamonds, finely contrasting with a pink pearl which forms the body, seated on a pearl-headed pm, and is the latest design for a lace brooch, so says a Journal of Fashion.

WWW Who will take an Apiary Record Book, if we get some of them up.

We are sometimes asked who of rain, and this has fallen during our authorized agents are? Every subscriber is such an agent; we have no others, and greatly desire that each one would at least send in one new subscriber with his own renewal for 1882. The next few weeks are the time to do this. We hope every subscriber will do his or her best to double our list for 1882.

ts Coleman's Rural World, of St. Louis, Mo., of Nov. 3, has the advertisement of Mrs. Cotton, and an editorial notice endorsing her [him, we mean.l After all the evidence of fraud that has been given, it is deplorable that agricultural papers should aid in defrauding the public thus for a few paltry dollars.

W New subscribers for the Weekly BEE JOURNAL, for 1882, will have all the remaining numbers for 1881 free from the time the money is received at this office. Therefore, the sooner they subscribe for it, the more they will obtain for the \$2.

Subscriptions may commence with the first number of any month in the year.

### MISCELLANEOUS.

Good Fall Crop of Honey. - The Indiana Farmer says :

Mr. J. Hole, Butlerville, Ind., writes us that this has been one of the best seasons for fall honey that they have had for several years, principally from golden rod and asters, making it necssary to extract from the body of the hives to give the queens room in which to lay. We have received other reto lay. We have received other reports of like character from several different localities, all going to show that the yield is quite general, making the prospect for safe wintering very

Well Turned.—The Daily Argus, of Middletown, N. Y., remarks as follows:

Scientific bee-culture has taken a rm hold up the Midland. The beefirm hold up the Midland. The bee-keeper who now kills his bees to get the honey is twin brother to the man who kills a hen to get her eggs. I was going to write an article on apiculture when I began this, but perhaps the best thing I can do is to advise all of my readers who are in anyway interested in bees or honey, to send postal ested in dees of noney, to send postal card for sample copy of the AMERICAN BEE JOURNAL, Chicago, Ill. They will find it a live paper on the bee, and its editor as fine a fellow as ever hand-led a year. led a pen.

Bees in Navarro County, Texas,—B. F. Carroll, Dresden, Texas, in the Texas Agricultural Journal, thus describes the season for honey :

The year ISSI will long be remembered, first, by the unusual severity of the winter; 2d, by the terrible freeze on the 14th day of April, that destroyed nearly every green vestige; destroyed nearly every green vestige; 3d, by the strange phenomena of the heavenly planets and the many comets; 4th, by the most destructive drouth that has visited Texas since 1857. On the 19th of May we had a good rain, and since that time we have not had over one and a quarter inches

September and October-nearly five months without rain, and the dry weather continues. After all this dry weather continues. After all this dry weather, the bee-keepers of old Na-varro have done very well. Many of us have gathered over 100 pounds of extracted honey per old colony, and our bees are now booming. The cool nights have started the cotton plant to growing, and it is now blooming nicely, and furnishes, during September and October, an excellent quantity and quality of honey, and with the aid of broom-weed and goldenrod, our bees are destined to go into winter quarters in excellent trim, and give us some surplus. They are 50 per cent. better off now than last year at this time. The increase of bees by natural swarming during this year did not exceed 10 per cent. By the aid of comb foundation, I increased my stock over 100 per cent., and sold at least 25 per cent, more in early queens and full colonies.

Avoid Bee-Murder .- The Grange Bulletin records its views of killing bees by neglect, in these words:

The preparation of bees for winter The preparation of bees for winter should now be the study of all conscientions bee-keepers. If not yet decided as to how to prepare them, read up at once. Apply the knowl dge gained to practice, and be prompt in making all necessary arrangements; for no man deserves the name of bees keeper or should attempt to keep. for no man deserves the manic of bee-keeper, or should attempt to keep bees, who has not resolved with all bees, who has not resolved wi sincerity to avoid bee-murder. nights have a tendency to retard brood rearing, consequently some assistance should be given to enable the bees to keep as warm as possible. A quilt or blanket is very beneficial to the bees spread over the frames. It is imma-terial of what they are made. Pieces of carpet, anything will do that will keep in the heat and absorb the moisture arising from the bees.

Curiosities of Bee-Slings,-Prof. A. J. Cook, in the New York Tribune on this subject, remarks as follows:

What has not been recommended as What has not been recommended as a specific against bee-stings? Clay wet with spittle, various acids, the expressed juice of certain plants, etc. The last is the following from the Scientific News: First remove the sting as soon as possible with a forceps, or by scratching with the finger nail, but never between the thumb and forefinger, because this squeezes more of the poison into the wound. Next squeeze the wound till a drop of blood comes out, and then rub the place with a solution of salicylic acid. A trial of the above proves that it is, trial of the above proves that it is, like most of the others, without effect. The active principle of bee stings is formic acid, so we would suppose that an alkali would be the best Nor are we wrong, as ammonia ap-plied to the part after the removal of the sting, as described above, is probably the best application that can be ably the best application that can be used. A curious fact connected with bee-stings is familiar to all bee-keepers. It is that sometimes a sting is much more painful than at other times. Usually, a sting affects me so slightly that I do not mind it at all. Occasionally, however, it is very painful, swells badly, and is followed by lameness for 2 or 3 days. Whether this peculianity follows from the variable amount of poison injected at different times, or to the greater suscepferent times, or to the greater susceptibility of some portions of the hody to the poison, I am not able to say; but this fact, and the readiness with which some people generalize from a single observation, accounts for the multitudinous remedies for bee-stings which appear in the papers, the most, of which, are worthless. It is a curious fact that the receiving of frequent stings seems to innoculate the person so that the stings lose their power to produce harm. I have not only proved this to be true in my own case I have not only but I see it illustrated in my students

For the American Bee Journal.

That "Coming Bee."

JAMES HEDDON.

So much has been said proof con in regard to the Cyprian bee, lately, that many of us are led to wonder what part she is going to play in the make up of the coming bee." Now, I have never seen a Cyprian, but have conversed with those who have, and have read the reports of numerous tests made with them. I suppose that the conflicting accounts regarding their ferocity must be settled in our minds in some way. It is about settled in mine now.

I have noticed that those who always import the genuine, and those who have purchased from them, agree that they sting through boots and all. These bees look so much like the Italian, that I have no doubt but that the bees of those who "find the Cyprians very gentle," are simply Italians, and not the pure belligerents. This is the only way that I can account for the very different reports handed to us out siders.

out siders.

I hardly think that any more than the best Italians and blacks are needed to produce the coming bee. While I have full faith in such a production, I hardly think it will be done all in a minute or three trees. minute, or by one, two or three men alone. I think it will be the aggreminute, or by one, two or three men alone. I think it will be the aggregated labors of a number of Americans. It will be a growth—evolution, hastened and guided by the hand of intelligence. I cannot refrain from penning a smile at the late prize effort made by the Rev. E. L. Briggs, of Iowa. While I sympathize with the end in view, I must say that the method he employs to reach it is not at all the one I follow, advocate or believe in. I will explain. First, let us lieve in. I will explain. First, let us consider the four points of excellence that Mr. B. makes the test:

1st. "The largest in size herself, and hardest worker proge-

producing the largest misize nersen, and producing the largest worker proge-ny." I have seen small queens that produced large, gentle and industrions bees, and such queens should not be

ranked as second class.

2d. "Producing the brightest colored workers." The experience of the most extensive importers and

the most extensive importers and honey producers, is that the dark Ital-ians are superior to the bright ones. 3d. "Her progeny being the most peaceable in handling, and adhering to the combs the closest." We agree exactly about the peaceableness, but I consider the adherence to the combs of minor consideration compared with

other points of merit.
4th. "As far as it can be ascertained this fall, the most prolific breeder, and this fall, the most prolific breeder, and honey-gathering worker offspring." Now in regard to the most prolific breeder, I deem it a great mistake in bee-keepers to cherish and encourage this quality. If a queen cost five dollars, and the hive, combs, etc., only five cents, then prolificness would be of great value; but as just the reverse of this is true, and as it is also true that in the greater profusion a vegetaof this is true, and as it is also true that in the greater profusion a vegetable or animal products, the lower is the quality of the product. I find that the most profit lies in using a hive of that size that the very moderately profite queen always keeps full of brood. Small hives for surplus Small hives for surplus.

The honey-gathering quality in the

The honey-gathering quality in the offspring is desired by all, but I want two or three years to thoroughly test a strain of bees for this valuable trait. Comb-building capabilities are also of vast importance. So far as I am concerned, I would as soon order a queen of any of the others who sent one to Mr. Briggs, as from Dr. Wilson. It seems to me that when money and seems to me that when money and time are devoted to tests of qualities. that these tests should be made comprehensive and thorough enough to satisfy the public. "Handsome is that handsome does:" valuable is that valuable proves. Below I give you a Dowagiae

test of success in skillful breeding, by quoting from a letter just received by me, from an honest man living in another State. I quote without his consent, and, therefore, withhold the sig-

..." It has been a very dry and hot this been a very dry and not season; have had a good crop of honey, and of good quality. My crop will average about 200 lbs. of box honey per working colony in the spring; have doubled my number. spring; have toroned my immore. From one colony in the spring, with no extra chance, I have to-day three new colonies, all good and in the best condition (except about 15 lbs. too much honey in each of the hives); from the old one and increase, 400 lbs. of what above and 100 decks all in of white honey and 300 dark, all in 2-lb, sections. Another gave 400 lbs. and no increase. I have worked my bees for all they are worth. A large portion of my white honey was from red clover. I have a strain of bees that I commenced breeding from—a hybrid—that worked on red clover five years ago; have bred from the ones that gave the most honey without re-gard to anything else, and as closely in-and-in as possible. They are im-proving every year, and have taken as high as 40 lbs. of white comb honey per colony when there was nothing but red clover for them to work on, and colonies of Italians of the "peri-od," full as strong, did not get 1 lb. 1 confidently expect to find that "coming bee" by following this very strain: at least, I have more confidence than in sending to Italy for a queen to breed from that was reared by an ignorant peasant for no other purpose than to sell. In my opinion, the way our leading breeders are improving, or claiming to improve our bees, is a perfect humbing. I found out years ago, that filling. I found out years ago, may to rear queens that would satisfy the average enstomer, I was ruining my stock for honey. I have not reared any for the market for years."....

I believe the above writer comneneed the season with about 75 colonies. I have heard that a party who keeps the long, leather-colored Italians, more or less crossed with the German bee, has also had a good season, and has secured an average of 200 lbs. For additions of lbs, per colony from 150 colonies, getting over 400 lbs, from some of the best

ting over 400 lbs. from some of the best, all comb honey in sections. I have not heard from him personally, and did not learn as regards increase.

The above reports, in my judgment, give greater evidence as regards qualities, than do the awards of committees, or the down on the hind legs of the workers. As smoke is the best evidence of fire, so honey is the hest evidence of superior bees. My fears in regard to Cyprians are these:

They swarm too much.
They build too many oneen cells.

They build too many queen cells.

They are too cross.

This cross disposition, coupled with the hee's sharp weapon is no matter to be made light of. Property, to be valuable, must not only be suited to variation, must not only be surfed to its peculiar owner, but to the populace at large. That is what constitutes de-mand; demand makes price. The pursuit would have a very great set

pursuit would have a very great set back were the dread of the sting to be increased; the popularity of the pursuit would also fall. I fear, as stated by the Bee Journal.

The prolificuess, early and late, in this locality, would, one year with another, be of no value, while it would greatly aggravate dysentery. The bees we have breed too long, leaving off not earlier than the middle of October and beginning as early as February as feed. tober, and beginning as early as Feb

Note this : The Italians were brought to us as an improvement over the Germans. To cross these imports with mans. To cross these imports with domesties was to contaminate them. Now, the Cyprians are brought in the same light as were the Italians, and they become improved at once by a . It cross with those they were calculated to supersede. How is it? I have but ties, one desire in regard to them, and that is, that none of my neighboring apiarists will bring any of them into this community till better reports come

Dowagiae, Mich., Oct. 1, 1881.

For the American Bee Journal. Bees and Honey in California.

WM. MUTH RASMUSSEN.

From the American Bee Journal of Oct. 12, received a few days ago, I learn that at the 12th Convention of the North American Bee-Keepers' So-ciety, held in Lexington, Ky., in the beginning of October, I was elected State Vice President for California. Thanking the Convention for the honor conferred upon me, I propose to fulfill to the best of my ability the labor which my office calls for, and hope to contribute my part to make the next Convention as interesting and beneficial as the one just past has

Owing no doubt to the almost total failure of the past honey season. I find but a very meagre report from this State, giving a very imperfect idea of the magnitude of the honey interest of California, as about every second year is a failure for honey production here, and it has been thus, since I entered the business 12 years ago. We may hope that the coming season will be one of prosperity for the California bee-keepers, and that at the next Convention we may be able to present a more favorable report than the last.

I am just on the eve of a trip to Los Angeles Co., where I will meet some of the principal honey producers of southern California. Shall also com-municate by letter with the Presidents of the various District and County Associations, and appoint suitable persons to encourage exhibits of honey.

sons to encourage exhibits of honey, etc., at the local fairs, for which purpose I await the pamphlet to be furnished State Vice Presidents.

I have just within the last week completed my extracting, for which reason I could not report in time for your statistical table. I delayed the last extracting as long as possible, as the bees were still getting some honey, but trosty nights set in and it was with some difficulty that I got the honey out of the combs.

The principal honey plant in this lo-

honey out of the combs.

The principal honey plant in this locality is Alfalfa, or Lucerne, which here is allowed to go to seed before harvesting, while in the Southern Counties it is cut as soon as it shows bloom. This year, however, it did not yield as much honey as last year.

The velley in which this has be

The valley in which I live lies be tween the Eastern part of the Sierra Nevada and the luyo Range. The mountains, on both sides, contain a number of mines, while only a narrow strip of the valley is suitable for farming. Bees are kept to some extent by several farmers, but in the old-fash ioned slip-shod way and my extractor and improved hives have created quite an interest, although as far as I know, thereby it stands. I am the only per-son in this valley making an exchi sive business of bee-keeping. menced the season with 24 colonies, have increased them to 53, and taken ibout 3,500 lbs. extracted honey; 12 or 14 of the colonies were queen-rearing nuclei, from which I did not extract. but they are now good, strong colonies. My bees are nearly all Italians and hybrids.

Independence, Cal., Nov. 1, 1881.

For the American Bee Journal.

The Business of Supply Dealers.

J. V. CALDWELL,

The business of the dealer in sup-The business of the dealer in sup-plies for the apiary having never taken its place among the business associations of the day, a few thoughts as to the manner in which it is carried on will, perhaps, be in order. While reading the advertisements

of supply dealers as they appear in the bee periodicals, the thought often comes to my mind "why should men engage in this business carry it on in such atter disregard of the acknowl-edged laws of trade?"

It being a well-known supposition that all men engage in business for that all men engage in business for the between to the outside of the the purpose of making money, unless indeed they be near kinsman to some enthusiastic writers on bee-culture, 6x3 inches, sides 6x½ inch, bottom 3

who tell amateurs in the business how the bees " work for nothing and board themselves

I cannot force myself to the belief that these dealers are such noble phi-lanthropists as would seem to be the case at first sight. Of course we can not expect to succeed in having all

Different locations, in some instances, give one person the advantage in some respects. If a man lives in the midst of a great lumb r region, he can afford to sell hives or hoxes thanker than authors thing in the ne can afford to sell filves or hoxes cheaper than another living in the wilds of Western Kansas, and still have the same prolit. But it seems to me there are certain conditions which all might observe, for instance, we know choice queens cannot be raised very cheap without loss to the breeder; queens are sold cheap, but whether or not they are choice is another question. I have sold queens cheap, and have done so at a loss, but in future I shall not be so foolish.

Rev. A. Salisbury says, "none but fools sell dollar queens, himself included," and I gness he hit the nail on the head that time. While people buy queens as we know they do to improve their stock, it seems to me if all responsible breeders would sell only cheaper than another living in the

responsible breeders would sell only choice tested queens, the bees would be improving from year to year. And again in view of the heavy loss among confiding bee-keepers, every dealer should be compelled to give good and satisfactory references. This is cussausfactory references. In its ens-tomary among all business men, and if a m n cannot give good references he should not expect men to trust their hard-earned dollars in his hands. Finally, let all who are in the business strive to deal honorably with our fellow men, and let our moral character, business habits and standing, be open to the rigid scrutiny of all men.

Cambridge, Ill., Oct. 14, 1881.

For the American Bee Journal.

### The Best Out-Door Protection.

E. L. BRIGGS.

To place one's bees in a good cellar, where the temperature is kept uniform at between 40- and 50- is, doubtless, the safest and most economical plan for wintering bees that has yet been devised. But even this mode must be attended with certain precautions, or in many cases disaster will result.

1. They must be put in before frost

and dampness gathers in the combs.
2. They must have some kind of up-

2. They must have some sing or up-ward ventilation, but not enough to create a draft through the hive. 3. The cellar should be kept dark, and be well ventilated from the bottom.

They should be carried in some-where about the middle of November, and left in stillness and perfect quie tude until about the first of April. H however, they show signs of restless-ness, they should be set out on their a calm, sunshing day occurs with the thermometer above 45-; but never if below until such aday occurs. Let this be done in February, if possible. But, after all, when one's apiary be-

comes large in numbers, this mode involves much labor. I have experimented to some extent, therefore, on out-door wintering. The following mode I believe will prove a success: I have set my colonies in rows of 9

each, making the row a little less than 16 feet from one end to the other, say 15 feet 4 inches, doing this in the summer in preparing for winter. Let the her in preparing for winter. Let the bives front the south, and the fly-hole of each hive be 5 inches from the ground; the back end of the hive a couple of inches higher. Take a comcouple of inches higher. Take a common fence-board, 6 inches wide and 16 feet long, and place it in front of the row, so as to leave a space 1½ inches in front of each hive, between the board and hive; saw a notch in front of each hive, 3 inches wide and I inch deep, for the reception of a tubular entrance, to extend from the flyinches wide, and long enough to reach the bottom board of the hive in front. Tack the half-inch strips to the top; next tack on the bottom. This form a communication from the inside of the hive to the outside, through which the bees can pass at any time when the weather is mild enough for them to fly. A foot plank, 16 feet long, set up on the top of the fence-board above the winter fly-holes, forms the balance of the front of this winter receptacle. Two more such boards forms the back. placed 3 inches away from the back ends of the hives. Nail the front and back at the ends to pieces of scantling: put in end pieces to fit, and nail to the

put in end pieces to fit, and half to the same corner pieces.

You now have a tight box 16 feet long, 18 inches high in front, 2 feet high at the back, and 28½ inches wide in the inside, without a bottom. This rests upon the ground, around the Sornine hives, and when the entrances around in its interests that of chaff characteristics is the predict full of chaff. are put in, is to be packed full of chaff are put in, is to be packed full of chaff in front, rear, underneath, and be-tween the hives, up to and even with the top of the honey-board. Take off the honey-board, and spread over the whole top of the frames a coarse cot-ton or linen cloth, to keep the bees from flying out when the top chaff-box is removed. When frame the synet is removed. Make a frame the exact size of the top of the hive, 2½ inches deep, and tack on the under side the same kind of a cloth for the bottom, and then fill this box with chaff and and then fill this box with chaff and set it upon the hive, in contact with the other cloth. Fill all the spaces between the top boxes, and the back and front, with chaff also, and the hives are now completely isolated from the weather, except by the tubular fly-holes, which are only 3x2 inches, and 6 inches long. 6 inches long.

Cover the outside box with any kind of a lid that will keep out the snow and rain, but have it so that the lid can be raised on any sunshiny day, when it is desirable to have the bees fly out for an airing. On such a day raise the lid and propit up, so that the sun can shine in upon the cloth coverings of the bives in full force. Then lift off the top boxes of chaff, set them in any convenient place to dry out the dampness, and let the sun's rays fall dampiess, and let the sun's rays far directly upon the cloth coverings above the frames. This will warm up each colony in a few moments, also evaporate all the dampness in a few hours, and give the bees their necessary airing at the same time.

At the approach of nightfall replace the top boxes of chaff, make all sung again by leveling off the chaff, close the lid, and your bees are in good condition for another winter nap of 6 or 8

The top chaff box affords all the upward ventilation necessary, while the bees are quiescent in their semi-torpid state; and the long tube will not let sufficient frost enter to accumulate in

the combs.

The above is the only chaff casing which I would trust, in as severe a season as last winter. In the place of chaff, one could substitute dry leaves, sawdust, oat hulls, tan-bark or fine chip-manure, or any other substance which is a good non-conductor of heat. and a good absorbent. In case the bees need feeding during winter, put a half inch thickness or more of grana har men the charges of more of ghan mediately over the cluster of bees, set the chaff box over it, and the breath of the hees will slowly dissolve it, and they will suck the syrup through the cloth as they need it, and any surplus will be stored by the bees within reach

the cluster. In the above outside easing and chaff In the above outside easing and chair filling, I have combined all the excel-lences of the various hives, and means of protection for out-door wintering, that I have ever seen suggested thus far, and at the same time secured the requisite means of disposing of damprequisite means of disposing of damp-ness, which accumulates in winter from the breath of the bees. In short, it converts the whole nine into com-plete frost-proof hives, prevents moldy combs, and secures the requisite heat, so that the colony can reach any part

of their stores without being chilled.

The entire cost of such casing, beside the work, will not exceed 33 cents

For the American Bee Journal. Bacteria and Bee-Bread.

WM. F. CLARKE.

I have the greatest respect for Mr. Heddon's opinions, and it is with no small diffidence that I step into the arena to break a friendly controversial lance with so formidable an antagonist. But it seems to me his article on "Pollen Detrimental to Wintering," in the AMERICAN BEE JOURNAL of Sept. 7, is very vulnerable at several points. No doubt the motto several points. placed at the head of the article in question is a true one, and "in our common ignorance all have an equal right to guess;" but until absolute proof is obtained, let us remember that we are only guessing.

that we are only gnessing.

This, it seems to me, Mr. II. forgets, for no sooner has be announced his new "gness," than he becomes almost, and then apparently quite cerin that he is right. He "stands 10 to in favor of his new theory, and in the course of a few lines, waxing more confident, finds "it comforting to feel satisfied," flatters himself that "a step satisfied," flatters himself that "a step has been taken up the hill of science proceeds to argue on the basis of 'allowing this to be the cause." He says: "I have settled down on the belief, strong and positive." Now what proof does Mr. II. furnish in support of his consumption-of-bread theory?

theory?

1. That the maccountable theory? 1. That the innacconntable phenomenon of Smith's bees all dying, while Jones' treated the same, and only 3 miles distant, all, or nearly all live, is yet on our hands, and he thinks his new theory will solve it. But fails to show how it does so. 2. ". preference for honey during all that period when bees must void no excrement, except by sensible or insensible perspiration, is a fixed fact." Variation from that rule, he thinks, is the cause of dysentery. I would ask, is there any period during which bees "void no excrement?" During the pe-riod of rest they void very little, but is it not generally conceded that the ridges of dust which fall on the bottom board during winter, consist of dry feces? Probably, when wintered in perfect condition, bees obtain all relief they need in this way

L. C. Root, in his new edition of Quinby's Mysteries, page 255, men-tions a case of wintering so satisfactorily, that the bees, though impris-oned from Nov. 47 until May 3, voi-ded no feees in a liquid state on being set ont. Did those bees wholly abstain from the use of There is no proof of it. 1 It is not that bees void no feces during winter, but that their diet is so wholesome, and that their diet is so wholesome, and they come into a state so nearly dor-mant, that exercising but little, they eat sparingly and void only a small quantity of excrement, and that in so try a condition that it does not befoul

Mr. Heddon's argument based on the assumption that during a certain period "bees must void no excrement" except in the form of perspiration, is without force. They may and do void some excrement, but it is in minute dry particles that accumulate harm-lessly on the bottom board. I cannot suppose that Mr. II. considers these minute particles dried drops of perminute particles affect arops of perspiration. What huge drops they must he when they ooze out of the body of the bee, if, after evaporation has dried them, they are of the size we find them. 3. The third proof of his new theory is, that he has found no dead colony that had "not either plenty of bee-bread showing signs of late work with it, or brood in all stages, and generally both, but nearly always brood Observe the qualification in this last sentence. "Nearly always." "What, never? Hardly ever." This is a very weak place in the reasoning. I can understand that it may, and probably does interfere with successful winter-

per colony. This is much cheaper than double—chaff hives, and ten times as effective as a protection.
Wilton, Iowa, Nov. 8, 1881.

with the color of erally than accords with that state of quiescence which we know to be so desirable, but, inasmuch as some col-onies died that had no young brood, the argument becomes inconclusive. A chain is no stronger than its weak-est link. There is another weak spot in this argument. It is that every dead colony showed signs of having been including in bee-brend. I prebeen indulging in bee-bread. sume they also showed signs of having been eating honey if there was any. Mr. II. assumes what he sets out to prove, viz: That eating bee-bread is detrimental to bees. 1, for one, am not convinced of this. They may, from certain causes, have eaten too freely of it, but to assume that beebread is poisonous on this account, is as unwarrantable as to conclude that fruit is unwholesome to human beings, because some eat too much of it. and become sick. Moreover, we know that bees in storing cells with pollen, fill them out and seal them with honey. May not a dead colony with plenty of bee-bread showing signs of late work with it bridge hose plant this kind. with it-having been doing this kind of work, viz: getting the honey separated from the bee-bread?

I am not quite clear whether Mr. II. considers the use of bee-bread to any extent, however small, injurious to mature bees. I am inclined to think he does, because he says: "Some method of causing the bees to abstain method of causing the bees to abstain from eating pollen during all that period when they are obliged to semi-hibernate, is what I most desire." Total abstinence from pollen, would seem to be Mr. H.'s new rule for successful wintering. If so, I am constrained to differ from him. I incline to the opinion that as hay, straw and other coarse kinds of food are necessary to the best health of horses and cattle and as outmeal porridge. Grasary to the best heatth of norses and cattle, and as oatmeal porridge, Gra-ham flour and the like are good for man, so there may be a necessity for bees to use a proportion of bee-bread. I am aware that there is a difference of opinion among bee-keepers on this point, some thinking that bee-bread is never used by mature bees, except they are driven to it by impending starvation.

The analysis of pollen would suggest that there may be elements in it that are beneficial to mature bees. It contains nitrogen, carbon, hydrogen contains introgen, carbon, hydrogen and oxygen. Seven per cent. of it is albumen, and there is quite a percentage of fat in it. Honey is no doubt the most refined and concentrated food for bees. The current idea is that they cat nothing else during the height of the marking respectively. that they cat nothing else during the height of the working season, though the Scotch verdict, "not proven," at-taches to that opinion in my mind. But if in the press of hard work they eat only honey, it may be that their case is like that of a horse when their case is like that of a horse when put to his greatest exertion of strength. Then for a short time he may be fed almost wholly on grain, but he must soon return to a partial hay diet, or he will be totally ruined. I cannot prove that bee-bread is a useful and necessary part of the diet of mature bees, but I strongly incline to this view, and see the motto at the head of Mr. II.'s article, "Who shall decide when doctors disagree?" Mr. II. thinks bee-bread the cause of dysentery, while other eminent bee-keepers concur with Mr. Von Morlott, who says that "dysentery does not occur among bees in summer, because they among bees in summer, because they have an abundant supply of pollen, and can fly out at all times." If pollen

and can be one at a times. It points the prevents dysentery in summer, does it cause the disease in winter?

Well, we have got rid of the bacteria. Mr. II. has lifted that mysterious dread from off our minds, and ve all feel more comfortable. The consumption-of-bread theory " is not

"consumption-of-bread theory" is not so terrible an affair as the invisible and impalpable bacteria.

Notwithstanding Mr. H. has "settled down" on his new belief, "strong and positive," I venture to advise him to go slow. I cannot think it would be good policy to eliminate the pollen from our hives next November. It would probably be well to see that our stances." As Mr. D. is a man of much

colonies have both honey and white sugar syrup. Possibly, a varied diet is good for bees, as well as for some is good for bees, as wen as for some higher orders of beings. It is ours to see that there are stores. We must leave their consumption to bee-in-stinct and bee-appetite. Mr. II. seems to fear that bee-bread may sometimes be more attractive to bees than honey I doubt it. Provide them with both, and if they partake of any bee-bread, I think it will be from some felt necessity. When porridge, beef steak and hot rolls are set before me for breakfast, I feel strongly tempted to give the porridge the go-by, but I know that it is good and necessary for me. Perhaps bees are in this respect as wise as I am; I know that in many as wise as 1 am; 1 know that in many directions they are far wiser. I have no doubt bees like honey better than any other article of diet; they always act as if they did. With plenty of honey, if they at bee-bread, I think it has a Lort puriles. it is as I eat porridge, from a sense of

This matter of wintering sorely taxes our best brains. While so much perplexity hangs around it, let us heed John Bunyan's maxim, "to preach only what I know." For all that he is so strong and positive, Mr. II. does not know that pollen, more strictly, bee-bread, is detrimental to winter ing. Some careful experimenting will be necessary before we dare lanuch our apiaries out into winter on this on aparties out the owner of this theory. But there are several things we do know. We know that successful wintering depends very much on timely fall preparation. We know that there is a temperature and a quietude which brings bees into a semitorpor highly conducive to safe win-tering. We know the use of the division board in contracting space to the occupying and warming capacity of a colony. There is one point which I am inclined to think is not so well known as it should be, and that is the importance of widening the spaces between the combs in the center of the If the frames are kept their usual distance apart, the bees cannot cluster in sufficient numbers between them to generate the desired amount of heat. Oversight of this has, I believe, caused the death of many colonies. Probably we shall find out by-and-by that the secret of successful wintering does not lie in any new theory, whether of hacteria, bee-bread or anything else, but in a careful con-formity to all known conditions. We may keep the whole law except in one point, and that in a particular season, may be the hinge on which the question of success or failure turns. In no pursuit is wide-awake attention to de-tails more necessary than in beekeeping.

Listowel, Ont., Sept. 9, 1881.

### Three-Band Test for Italian Bees.

E. A. THOMAS,

On page 285 of the Weekly Bee JOURNAL, Mr. G. M. Doolittle says: "We must conclude that the window test is sufficient, or else that no certain purity exists to the long-continued home of the Malian bee." It seems to me that there is evidence seems to me that there is evidence enough to prove that there are black bees in Italy, and if so it may readily be seen that some of the queens im-ported from Italy may be hybrid; and if hybrid queens have been imported, what is the use of trying to make Italians out of them by applying the window test? It seems to me Mr. Doolittle is getting this matter down Perhaps I take the a little too fine. Perhaps I take the opposite extreme when I say that bees that will not stand the most severe test, and show the three orange-col-

experience, this would imply that on each side are two stringers 10 feet there are no such bees. I have colonies in my apiary that will show the Commencing at back end of the room, mes in my aparry that will show the three vellow bands at any period of life, from the time they get dried off after emerging trom the cell, until they are too old to fly. I have also seen such colonies in the apiary of Mr. Theodore James, North Adams, Mass., and I know of several others who have such bees. The bands are not onite so light-colored on the very who have such bees. The bands are not quite so light-colored on the very old bees, still they are there as plain as day. Although I think the age of as day. Although I think the age of the bee has something to do with its markings, still I should consider bees that had to be filled with honey and placed on a window in the sun, as im-

I am surprised to see Mr. D. take the position he has, on account of the effect it will have on those who are not very well acquainted with Italians. Such might be led to believe that bees having black blood in them were all

I cannot see how there is any danger of applying too severe a test, and it seems to me that the danger lies more in the opposite extreme. Beemore in the opposite extreme. Bee-keepers cannot be too careful in test-ing queens, and all bees that will re-quire one of Sam Weller's "patent double-million-magnifying gas micro-scopes of hextry power" to determine whether they are pure or not, should be got rid of as soon as possible, and when such stock is got rid of, we may hope to improve the race.

Coleraine, Mass.

For the American Bee Journal.

### How I Winter My Bees.

J. H. ROBERTSON.

To best illustrate my method of wintering bees, we will take hive No. I, which stands about 4 inches from the ground, the entrance some lower than the back; made from pine lumthan the back; made from pine limited ber 7g of an inch thick. Is inches long, 12 inches deep and 12 inches wide, inside measure. The bottom board projects 4 inches in front, and is securely nailed to bottom of hive; entrance, 13 inch wide and from 6 to 10 inches long. Around the top of the hive less I inch is an inch band; cover or top is some larger than outside of hive, resting on band; no paint; the hive contains 8 frames, all worker combs running from entrance to back of hive; over frames is burlaps cover. The comb from entrance to back of five; over frames is butlaps cover. The comb ranges from 2 sheets of foundation worked out this season to combs 15 to 20 years old. These contain 15 to 25 lbs, of sealed honey, some unsealed, quite a quantity of pollen, and very little, if any, brood. The queen is a more vigorous dark Italian, and less. untle a quantity of ponen, and very little, if any, brood. The queen is a pure, vigorous dark Italian, and less than 2 years old. The hive is fairly boiling with young, healthy matured bees, and so full of them that if you lift the corner of the cover they boil in the production of the cover they boil in the production of the cover they boil in the context of the cover they boil the cover they boil in the cover they boil in the cover they boil in the cover they boil in the cover they boil in the cover they boil in the cover they boil in the cover they be a cover they be a cover they be covered to the cover they boil in the cover they boil in the cover they boil in the cover they be covered to the cover they be covered to the cover they be covered to the cover they be covered to the covered over, seemingly pleased to get a little

more room.

To insure success, we enforce these conditions on every colony by removing all light and empty frames, crowd-ing the bees on as few combs as they will cover well, using division boards. If but one comb it must be an old one 12 or 23 full of sealed honey, and from 4 to 5 holes through it. Place in cen-ter of hive with division board on each side, leaving  ${}^1{}_2$  inch space on each side of comb; cover over with burlaps and fill balance of hive with dry sawdust, always using full sized hive

for winter.

I have in my home yard a half score of rows 10 rods long, about 5x10 feet-from center to center of hive, where under my own supervision, every col-ony will fill these conditions with less than I score of division boards in use, than I score of division boards in use, and not one ounce of packing of any kind, we are ready for winter. I let their stand out until winter is fairly on us; then carefully remove the top, place a block over the entrance, load 15 or 20 on car and run to

long, 6 inches high, securely fastened. Commencing at back end of the room, I place my first hive about 12 inches from the walls, entrance to the center. from the walls, entrance to the center, on top place two pieces of lath cut the right length; on these, our next hive, two more pieces of lath and another hive, and so on until they are 6 feet high, filling up both sides—putting in every colony in the yard—leaving an alley in the center and room to pass all around both rows. After all are in, will guage the entrance with blocks as I think necessary. As soon as possible I will put 6 or 8 tons of ice in the front room, always keeping it well front room, always keeping it well filled and covering the floor with 2 or 3 inches of slowly moving water, the ventilators being so arranged as to ventrators being so arranged as to keep the air pure, and the thermome-ter in the neighborhood of 40; bor-rowing notroub'e if it occusionally rises to 50 or 60-, leaving them here from 140 to 150 days, requiring all the time, constant and careful attention.

As soon as the weather is favorable, I take them out, not over 1 or 2 car-I take them out, not over 1 or 2 car-loads per day, being careful to place them upon the stands they were taken from in the fall. I will now leave them entirely alone, not disturbing or handling them only when necessary; this we will know at a glauce when driver.

They have been confined so long they have forgotten all about civilization. For a few days after taking them out the greatest care must be taken to keep them from stinging us, which they usually seem bent on do-ing with a vengeance. I will now take nuclei and put them in colonies that are queenless, crowding them to working order as soon as possible. My loss in 6 years has been 2 per cent. of colonies put up in the fall, and  $1\frac{1}{2}$  per

cent, of queens. Pewamo, Mich.

### Canadian Bee-Keepers' Convention.

An interesting and profitable gathering of the bee-keepers was held in Lindsay, Ontario, Oct. 11th and 12th Lindsay, Ontario, Oct. 11th and 12th in the council chamber. Mr. S. Corneil was called to the chair, and Mr. C. Neads was requested to act as Secretary. There was a good attendance. It was resolved to form an association to further the interests of bee-keepers to farther the interests of bee-keepers in the Midland district included by the Central Fair Association. On motion. Messrs. W. G. Russell, C. Neads and S. Corneil were appointed a committee to draft a constitution and report the following evening.

Reports from those present were called for, which being summed up, show that the number of colonies now owned is 500, increased from 188 in

owned is 500, increased from 188 in spring; and that the surplus honey obtained was 16,240 lbs., 14,900 lbs. being extracted, and 1,340 lbs. in the

The best method of marketing the The best method of marketing the honey crop was then taken up and fully discussed. It was stated that much injury is often done by parties who, making bee-keeping altogether a secondary matter, bring their honey to the market as soon as taken in poor shape, and are obliged to sell for whatever is offered, thus breaking down the market at the start. The general opinion seemed to be that it was best not to rush the honey on the market not to rush the honey on the market too early. Most of those present wished they had their crop still unsold, as prices are advancing.

The next subject taken up was the different methods of wintering and their results. This was a very important discussion, and much valuable information was elicited. One method was to place the hives in a row on scantling, or raised from the ground a short distance in some way,

or dry sawdust, in fact, placing them in a large chaff bin outside, each hive, of course, having a shute from the en-trance, allowing the bees to fly whentraines, allowing the bees to fly when-ever the weather was suitable. Messrs. W. Hickson, John Calvert, A. E. Cal-vert, W. G. Russell, Arthur Russell and C. Neads were very successful last winter with this method. Mr. Carnegie, of the Peterboro Review, was present during the meeting and was invited to a sent at the table.

At the meeting on Wednesday even-ing, the report of the committee ap-pointed to draft a constitution was

rend and adopted.

The election of officers then took place and resulted in the election of pacer and testifica in the election of the following gentlemen to the differ-ent offices, viz: 8, Corneil, Lindsay, President; W. G. Russell, Millbrook, 1st Vice President; Mr. Hineman, Grafton, 2d Vice President; C. Neads. Gradon, 20 y 166 President; C. Neads, Lindsay, Secretary and Treasurer; A. E. Calvert, Reaboro, Thos. Hickson, Reaboro, and Arthur Russell, Mill-brook, Executive Committee.

was resolved that, whereas advanced bee-culture is comparatively a new industry in this part of the country, the importance of which has not heretofore been fully recognized, this association beg to suggest to the di-rectors of the Central Exhibition the propriety of giving greater encourage-ment by granting more liberal prizes,

and making a better prize list.

Resolved, That the thanks of this association be tendered to the Mayor and Council of Lindsay for their lib

chamber at our disposal.

Resolved, That each member be a committee of one to canvass for members for this association, and to send to the Secretary names of bee-keepers in their vicinity, or any in the territory covered by this association.

A question drawer was opened, and a committee appointed to reply to the queries. This elicited the following questions:

Would it pay to expose at this season of the year empty surplus combs? One reply was that if the combs were placed at some distance from the hives, the bees would clean them up and would not start robbing. Another opinion was that it was better to set them in the back part of the hive separated from the brood nest by a division bound sion board.

How to winter with the best results was the next question in the drawer. In addition to the methods given at the previous meeting, Mr. I. G. Moythe previous meeting, Mr. I. G. Moynes, of Fenelon, who has scarcely lost any bees during the last II years, gave his method of wintering his box hives in the cellar. His chief points were an even temperature slightly above freezing point, perfect darkness and no jarring, but above all, raising the hives one way two inches allowe the the hives one or two inches above the bottom boards for ventilation. If these points are attended to, it is not of so much importance whether the cellar is dry or not. We may state en passant that, after witnessing the bee-keepers' exhibit, Mr. Moynes has determined to reform next spring and determined to reform next spring and avaduage his love hives for more appeal. exchange his box hives for more mod-

exchange his box hives for more mon-ern appliances.

How would you transfer from box hives to frame hives and when, was the next question. As to the time, the answer was during fruit bloom, because the hives are then light, and there is something for the bees to gather. The process of taking bees and combs from the box hive and fixgather. ing them up snugly in movable trames mg them up study in movable traines was fully gone into, but a description in detail would be too lengthy here. Any one having such a job before him, can get full information in the books on bee-culture, any of which Mr. R. S. Porter will order on appliants.

Whether is natural or artificial swarming the best method of increase, came next in order. This called forth a most interesting discussion, both methods having very warm advocates. Against artificial swarming, it was urged that more attrainer, foat 15 of 20 of ear and run to bee house door.

The bee house is a frost-proof building, 48 feet long, 10 feet wide and 8 feet high; 6 feet from the entrance is a partition with a door in the center;

The bee house door.

In the minimation was eighted. One to be the was to place the hives in a warm advocates. Against artificial swarming, it was urged that more attention was required to prevent natural swarms than could be given by those not devoting their time exclusions.

sively to the business; but its advo-cates claimed for it a larger yield of honey. On the other hand, it was urged against natural swarming, that bees were sure to come out while the family were at church, or at other most inconvenient times, and if not promptly attended, they would go to the woods. Its advocates, while ad-mitting the necessity of a watch, claim that new swarms worked with so much vigor, that a larger yield of honey was obtained. This brought and a gamparison of what had been out a comparison of what had been accomplished by an advocate of each method. Thomas Hickson, of Ops, had 13 colonies in the spring, increased to 43, and took 1,600 lbs, of surplus honey by natural swarming. Joseph Russell, of Manyers, had 17 colonies in the spring, which he had increased to 65 by artificial swarming, and obtained 2,000 lbs, of surplus honey. These results were considered so nearly equal, that it was thought better for each to follow the method best adapted to his own particular out a comparison of what had been best adapted to his own particular circumstances.

The association sat till a late hour,

but everyone went away pleased with the discussions, and satisfied the time was well spent. The next annual meeting is to be held at the time and place of the next Central Exhibition.

#### Saunders Co., Nebraska, Convention.

On call of Rev. E. L. Dodder, a meeting of those interested in the culture of the honey bee was had at Wahoo, Neb., Oct. 8, 1881. Present,

Walno, Neb., Oct. 8, 1881. Present, 15 persons, all residents of this County. Rev. E. L. Dodder was selected as temporary Chairman, and Rev. J. J. Burtch, Secretary.

The object of the meeting was to consider, and if deemed desirable, proceed to the formation of an association in this County. tion in this County.

After due deliberation, by unanimous consent, the meeting proceeded to the permanent organization of the Saunders County Bee-Keepers' Assosamuers county bee-keepers Asso-ciation by the election of T. L. Whit-beck, President, Mrs. C. L. Stocking, Secretary, S. V. Decker, Treasurer and keeper of supplies. Members enrolled, 15.

 $\Lambda$  committee was appointed to draft a constitution to report at a subequent meeting to be called by the President.

Numerous valuable suggestions were made by those present, on the care and management of bees, Rev. E. L. Dodder, by request, de-

livered an excellent address, covering the entire subject of bee-culture, which was considered a rare-treat by those interested in the propagation and management of bees in the most approved and scientific manner.

The speaker has shown by the management of his apiary while residing in our midst, as well as by precept, that he is not only a bee-keeper, but a bee-master, and those who follow his instructions with judgment and care, must succeed. Adjourned.

### ADJOURNED MEETING.

The Saunders County Bee-Keepers' Association met in special session pursuant to call of President, at Wa-

hoo. Neb., Nov. 5, 1881.
The Secretary being absent, C. F.
Williams was chosen Sec. pro ym.
The Committee appointed to draft

The Committee appointed to draft a constitution, presented the same for action, which was adopted.

The officers of the association consist of President, Vice President, Secretary, Treusurer and keeper of supplies, who are elected annually.

Regular meeting, first Saturday in October and April of each year.

Any person may become a member of this Association on application and

of this Association on application and payment of 50 cents.

Office of Vice President being vacant, C. C. Turney was elected to that office for I year.

omce for tyear.

Additional members enrolled 5; whole number of members 20.

On motion, the Secretary was instructed to furnish each of the Iown NAL, with a copy of the proceedings. C. F. Williams, Sec'y pro tem.

# SELECTIONS FROM

Best llive for Comb Honey.—1 commenced last spring to keep a Bee Account Book, noting down everything count Book, noting down everything of consequence, which I shall keep for future reference. We had snow on Nov. 3, but it is all gone and my bees are now bringing in pollen. Please state in the Bee Journal which size of hive you think best for the production of comb honey. F. H. SEARS. tion of comb honey. F. H. Girard, Pa., Nov. 6, 1881.

[For comb honey nearly all agree that a shallow frame is best—we prefer the Langstroth.—En.1

Poor Honey Season. - The honey season in this section has been the poorest known for many years. No rain, to do any good, since June 10, till the 28th of this month. Waters lower than they have been for years: many of the streams are entirely dried up. Bees had to be fed to get them in condition for winter.

H. H. Brown.

Light Street, Pa., Oct. 31, 1881.

fIn the West there has been a superabundance of rain for the past month. To have had it equalized between the East and West, would have been more agreeable all around.—ED.]

Entirely Satisfied. - I had 5 colonies in the fall of 1880, and lost 3 last winin the fall of 1880, and lost 3 list whiter; they were wintered on summer stands. I have taken 130 lbs. of line section honey, and 12 lbs. extracted; increased to 7, all are well provided for winter. I am entirely satisfied over the result of last season's labor. I send my best wishes for the prosperity of the Bee Journal. I am much pleased with it and cannot do without it.

F. C. Gastinger.

Kenton, O., Nov. 2, 1881.

Honey from Alsike Clover. - After uniting a few weak colonies in too-spring, I had 136 colonies; sold 61 first class colonies and 2 nuclei, which left me 73 colonies to begin the season with. I worked 27 colonies for exfracted honey; have taken an average of 211 lbs, per colony. I put boxes on 20 young colonies, and have an aver-age of 40 lbs, each of comb honey. I run the rest of them for increase, and have this fall 147 colonies. Our bees had 18 acres of new seeding and 4 acres second crop of alsike clover to work on from which they gathered most of the honey. Basswood did not yield much honey this year.

(C. M. WOOLVER, Hallsville, N. Y., Nov. 6, 1881.

[ Here is a very good illustration that even in New York, where land is most valuable, it will pay to plant for bee pasturage. Had our correspondent not run for increase, and suppose only 150 of the 211 lbs. of honey were directly attributable to the alsike, he would have realized 10,950 lbs, from his 73 colonies, which, at 10c. per lb., would have brought the handsome sum of \$1,095 rental for 22 acres of clover-land.—Eb.]

The National Convention. -- I have The National Convention.—I have just finished reading that gem of an article by Dr. J. P. H. Brown, on the "Races of Honey Bees." To the sci-entific bee-keeper it is worth the price of a year's subscription to the Weekly of a year's subscription to the Weekly the Journal. I suppose this ends the proceedings of the National Convention, where a great many other splendid articles were read touching points on our noble and interesting calling. But notwithstanding all this, the National Convention did not come no to my expectations. When I read up to my expectations. When I read cut away by the little programme, and then the proceed-large greater numberings, I was disappointed. There ing them.—ED.]

seems throughout a great lack of interchange of views. Now, I consider the discussion of the various topics in the discussion of the various topics in hee-keeping the backhone of all beenneetings, whether local or National; but long articles, however excellent, crowd out other work. I do hope, in all future meetings throughout the country, this evil will be remedied by having shorter addresses and more discussion. Gro THOMESON GEO. THOMPSON. discussion.

Geneva, Ill.

f We quite agree with Mr. Thompson regarding the desirability of publishing more debate, but how can it be done without omitting the essays, or limiting their number to two or three? Much of this essay business is very monotonous to the general reader, and might, without loss to the public, be omitted from the published reports. Certainly, no editor would be excused by these essayists if he was to neglect publishing their productions in extenso, while giving an official report, and roreporter can do himself justice in giving sketches of debate, where his allofted space is already much more than consumed. We cannot see any way in which it can be done, except for the Society to employ a stenographic reporter, and publish the proceedings in pamphlet form.—ED.]

Spring and Summer Honey Plants.—Which are the most suitable honey plants (annuals) for early spring and summer? My soil is light sandy. Answer in Bee Journal.

Thos. R. Smith.

Leighton, Ala., Nov. 7, 1881.

(Catnip, motherwort and summer rape, ought to do well on your soil. Although a biennial, try a patch of sweet clover (Melilotus alba).—ED.]

Using Drone Foundation .-- I have 6 colonies of Italian bees; should I use drone foundation in each hive, and arone tonnautor in each nive, and how much? Had I 30 colonies, should I use it, and how much? Or, had I better use a larger quantity in only a few hives located in the center of the apiary. One colony had 12 lbs, of honey, I gave them a frame of granu-lated sugar camby a week ago, next the side-wall. The bees have been carrying it out at the entrance ever since. I removed the candy, and onefourth was consumed or carried out at the entrance. Did I get the candy too hard, or burned, or should I have waited until their stores were nearly consumed before I gave the candy? To another colony having 8 lbs. of honey mostly unsealed, I gave 2 frames of sealed honey, next the sidewalls. The bees carried the honey to the context frames stripped the frames. the center frames, stripped the frames of comb, and I think used it to cap over the honey. Why did they do so? F. M. CHENEY. South Sutton, N. II.

H'se no drone foundation, unless you have a particular strain that you desire drones from, in which case one or half a comb with drone cells will be ample, near the centre of brood nest. Nothing will be gained by placing this hive in the center of the apiary. Had you placed the sugar candy near the center, there would have been no necessity for the bees to carry it there; being granulated, the bees could not, without too much labor, liquefy it so as to carry it in their honey-sacs to the center. In winter, the moisture in the hive softens the candy so the bees can consume it. The combs of sealed honey might have been placed near the center. The cell-walls were cut away by the bees to give room for a greater number to assist in empty-

menced this season with 22 colonies, rather weak; increased to 33 by dividing, and bought 47. I now have 50 strong, pure Italian colonies, except one pure Cyprian, the head of the queen of which I intend to "pinch" early in the spring. The Italians are good enough for the increase the long early in the spring. The Hahans are good enough for me, i. e., the long, leather-collared ones. I have taken 700 lbs. of extracted honey of the finest quality, sold at 15 cts.; reared and sold nearly 200 queens, and have not quite done yet. There is plenty of honey in the hives to last through the winter.

J. S. Tadlock.

Kingsbury, Tex., Nov. 1, 1881.

Honey Cake.—At the request as printed in the BEE JOURNAL, I herewith give the recipes for the honey cakes that I presented to the Toronto Converting. 'onvention :

HONEY SPONGE CAKE.—Two-thirds of a breakfast cup of sour cream. enpsful of thour, an even teaspoonful of soda, I cup of butter, 3 eggs, 14 lbs. of soda, I cup of futter, seggs, 14 fbs. of honey. I tablespoonful of cinnamon, half tablespoonful of allspice, and a little extract of lemon; mix the spices with the tlonr; put the soda in the milk and stir well, that all the ingredients may thoroughly mix; heat the ake well for another 5 minutes; put ti in a buttered tin—bake from one-half to three-quarters of an hour. This is nice eaten warm. I used buck-wheat honey for those at the Convention.

GINGER CAKE.—Take 134 lbs. of honey, 14 lb. of butter, 115 lbs. of flour, 1 ounce of ginger, 15 ounce of ground allspice, 1 teaspoonful of carbonate of soda, 14 of a pint of sour milk cream if the distance of ground allspice, 2 organ, but the flour if you choose, 3 eggs; put the flour into a basin with the ginger and all-suign, mire them. spice; mix these together, warm the butter and add it with the honey to the other ingredients; stir well; make the milk just warm and dissolve the soda in it, and make the whole into a nice. smooth which shoul mooth paste with the should be previously which should be previously well whisked; pour the mixture into a but-fered tin—bake it from three-fourths to I hour; take the white of one egg and heat it up with a little sweet milk and take a feather and brush the top; this will give it a glossy appearance. This cake can be baked in 2 equal pietins. Mrs. J. G. A. Wallace. Brighton, Ont., Nov. 7, 1881.

[If some good sisters would make a honey cake for every Convention of bee-keepers, it would materially add to the interest. Anything to awaken enterprise and develop the uses for honey, must be advantageous to the bee and honey industry.—ED.

Why the Difference?—One year I had in my home aptary 60 colonies that ceased brood-rearing and honey and pollen gathering about August 15th. According to the best authorities, they Accouning to the nest authorities, they should have died off before spring from old age. Six miles away, in a swamp, were 24 colonies which gathered tall honey and pollen for six weeks later—these 1 bought. According to rule, these I bought. According to rule, they should have come through in prime condition. All were wintered in the same cellar from Nov. 17 to on the same cerair from Nov. 176 April 18. My home apiary, mostly old bees, spring honey, and little pollen, wintered well, and dwindled in spring 10 per cent. The swamp bees, with fall honey and pollen, wintered well also, and dwindled 60 per cent. The ways point of difference percenti-The only point of difference perceptible was that of frame—the swamp hives having frames 14 inches deep and the home hives being 112. Are we to blume the fall honey and pollen on which the swamp colonies wintered, or the difference in depth of frame; or the difference in depth of frame? If American bee-keepers will visit Toronto Agricultural Fair next fall, I have no doubt they will be somewhat astonished by the honey products exhibited there, as to quality and quantity.

I. C. Thorn, M. D. Streetsville, Canada, Nov. 3, 1881.

Italians are Good Enough .- I com- breeding in the swamp colonies; they had fresher honey, more pollen, and deeper frames to concentrate the heat in the center. We imagine that bees but seldom die from old age-certainly not in summer; but with everything the most favorable for wintering, the long, semi-dormant period is one of rest and repose, rather than debility and exhaustion.-ED.]

> Old Queens.-1 have several colonies of bees that have retained their drones. Supposing they were queenless, I opened one and found the queen all right. Please let me know through right. Please let me continue the BEE Journal why it is.
>
> C. BERKY.

Savannah, O., Oct. 3, 1881.

[The queens are old, and honeygathering and breeding having probably been kept up till quite late, a larger proportion of drones than usual have been reared.—ED.]

New Courage for Next Season.-Allow me to thank you for the very complete table showing the amount of plete table showing the amount of surplus honey, increase of colonies, etc., for 32 States. This table adds one more essential feature to the al-ready popular AMERICAN BEE JOUR-NAL, and no bee keeper that expects to keep pace with the rapid strides of our progressive pursuit, can think of getting along without it, and file of getting along without it, and file away for future reference every number that comes into his possession. The full report of the North American Bee-Keepers' Society, so recently held at Lexington, Ky., is a rich feast of great things which so many of us (though we could not be present), by our own quiet firesides, can be informed of all that was said and done through the columns of the Bee Journal. I will not comment upon any particular paper or speech read or through the column and particular paper or speech read or delivered before the Convention, but the way that it is "all good." The delivered before the Convention, bilt simply say that it is "all good." The bees are doing well in the mountains on goldenrod. A fine rain Oct. 25, gave us new courage, and renewed

confidence in the season of 1882.

A. W. OSBURN.
Los Angeles, Cal., Nov. 1, 1881.

"HELEN'S BABIES."-An entirely new edition of this famous book is in press, and will be published in a few days by T. B. Peterson & Brothers, Philadelphia, Pa., with a very handsome illustrated cover having portraits of Budge and Toddie, Martha, Mary and the Goat upon it. John Habberton, the author, has given Budge and Toddie world-wide celebrity; they have pleased thousands with their pranks, and will please thousands more, for it is simply impossible to resist their fascination. Orders should be sent in early.

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Wis., Nov. 30, 1881.

N. E. FRANCE. Sec., Platteville, Wis.

The Michigan State Bee-Keep-The Michigan State Bee-Keepers' Association, will convene at Battle Creek, on Thursday, Dec. 8, 1881. We have reason to expect one of the largest and most interesting meetings we have ever held. Let all arrange to be present. All District Associations should send delegates. Each person should come with their best experience in their bends, ready to bend perience in their hands, ready to hand it over to the others of the fraternity. Formulation rates are expected on ailroads. A. J. Cook, Pres.railroads.

T. F. BINGHAM, Sec.

[The difference in spring dwindling was probably attributable to earlier Texas, on Tuesday, April 25, 1882.

### Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts, each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoflice address, mention the old as well as the new address.

Those who may wish to change from other editions to the Weekly.can do so by paying the difference.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

An Agreeable Dressing for the Hair, that will stop its falling, has been long sought for. Parker's Hair Balsam, distinguished for its parity, fully supplies this want.

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bre-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the JOURNAL for a year tree. It will pay to devote a few hours to the BEE JOURNAL.

Women are Everywhere Using and recommending Parker's Ganger Tonic, because they have learned from experience that it speedily overcomes despondency, indigestion, pain or weakness in the back and kidneys, and other troubles peculiar to the sex.—

Home Journal, See adv. 44w4

if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.— Also, if you live near one postoffice and get your man at another, be sure to give the address we have on our list.

Why suffer such unspeakable tortures? Rheumatism has been conquered. Kendall's Spavin Cure is the victor. See advertisement. 44

We have a SPECIAL EDITION of the Weekly BEE JOURNAL Just as it will be published in 1882 (16 pages), for distribution at Fairs. Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OTTICE OF AMERICAN BEE JOURNAL, )
Monday, 10 a, m., Nov. 14, 4881. A

The following are the latest quotations for honey and beeswax received up to this hour:

#### CHICAGO.

HONEY. The market is lively and prices steady. We quote light comb honey, in single comb hoves, isotate; in larger boxes 2c, less. Extracted

BEESWAX Prime quality, 186/22c. At., H. NEWMAN, 972 W. Madison St.

HONEY—The supply is full, and trade is lively. We quote as tollows. White comb, in small boxes, 150-217c. Extracted, white, 100-11c., dark, 76-10.
BEESWAX—Prime quality, 21 ye 23c.
THORN & Co., 11 and 13 Devoe avenue.

#### ST. LOUIS.

HONEY.—In fair demand—Comb firmer at 2006 22c—a lot of 23 brayes sold at the latter figure. Strained and extracted rather slow at 9ac 12dgc, inside prior for round lots. Sate 16 bbls. (\$5000 lbs. net) on Thirrsday, at 10. BEESWAX—Selfing lightly at 19ac 20c. BEESWAX—Selfing lightly at 19ac 20c.

#### CINCINNATI.

HONEY—Is in good demand here now, I quote: Good comb honey, in sections, is worth 180/20c, on arrival. Extracted, 760c, on arrival. BEESWAX —180/20c, on arrival. I have paid 25c, per lb. for choice lots. C. F. MUTH.

HONEY.—1-pound combs are a desirable pack-ge in our market, and a large quantity could be old at 190-20c, according to quality. BEESWAX—P ime quality, 25c. CROCKERG & BLAKE, of Chatham Street.

#### SAN FRANCISCO.

HONEY-Supply is in excess of the demand at prices current. Several hundred cases arrived this week and there are advices of more still to come. We quote winte comb, 16620c.; dark to go (d. 108, 4c. Batracted, choice to extra winte, 194,10c.; dark and candied, 76 SC. BEESWAX-25620c. STEAINS & SMITH, 43 From Street.

### BALTIMORE.

HONEY.—But little on the market, and prices re not quoted.
BEESWAX.—Southern, pure, 216623c.; Western, mre, 216622c.; grease wax, 11c.—Bultimore Market

#### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb, sections, 22@25c.— Indianapalis Stock Review.

### PHILADELPHIA.

HONEY.-The supply and demand are alike nominal. BEESWAX - Best | Ught | 23@25c.-Philadelphia Merchants' Guide.

### CLEVELAND.

HONEY—We report the market quite active; about sales this week of could honey in 1 pound sections have been made at 22c, and two pound sections at 20c. Extracted has taken a start, and we report trade quite active in small packages, 30 pound in cause especially, at 12c, per 1b. Extracted in libbs, continues dull BEESWAX—2002—22c.

A. C. KENDEL, 115 Ontario Street.

# The Bee-Keeper's Guide;

### MANUAL OF THE APIARY,

By A. J. COOK, Of Lousing, Professor of Entomology in the

State Agricultural College of Michigan.

#### 320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual o the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full defineation of the anatomy and physiclogy of the honey bee, dustrated with many costly wood engravings— the products of the Honey Bee; the races of bees; tull descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated - and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that

no bee-keeper, however limited his means, can afford to do without. It is tully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

Read the following opinions of the Book;
All agree that it is the work of a master and of real value.—E Aprentiure, Paris.
I think Cook's Manual is the best of our American works.—bewis T. Colby.
It appears to have cut the ground from under turne book-makers.—Britch Bee Journal.
Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apary. J. P. West.
I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E, II. WYNKOOP.
This book is intst what geryone interested in

Prot Cook's New Mannal of the Apiary than from any other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who outsins it, will ever regret having purchased.—Mich. Far.

Is a masterly production, and one that no beekeeper, however limited his means, can afford to do without.—Nebraska Farmer.

To all who wish to engage in bee culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Montreello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The reflest reward awnits its author.—A. E. WENZEL.

My success has been so great as to almost astonish myself, and funch of it is due to the clear, disinterested information contained in Cook's Mannal.—Will, VAN ANTWERP, M. D.

It is the latest book on the bee, and treats of both the learned home with their bandaments. It is effective to the containment in the cook of the clean of them.

ual.—W.M. VAN ANTWRIC, M. D.
It is the latest book on the bee, and treats of both the bee and inves, with their implements. It is of value to all beer raisers – Ky. Live Stock Record.
It is a credit to the author as well the publisher. I have never yet met with a work, either French or Torean, which I hake so much.—I 'Albie Bill' Bots, either of the Bulletin D' Apiculleur, France. If not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—Democrat, Pulaski, N. Y.
We have nerused with great pleasure this pade.

enemies of bees.—Democrat, Pulaski, N. A. We have perused with great pleasure this nade means of the bee-keeper. It is replete with the best intornation on everything belonging to appenditure.—To all taking an intere t in this subject, we say, obtain this valuable work, real it carefully and practice as advised. Agriculturist, Quebec.

and practice as advised. Agriculturist, Queuec. This book is promounced by the press and leading see-men to be the most complete and practical iterates on bee-caliform in Europe or America; a scientific work on modern bee management that every experienced bee-main will welc me and it is essential to every amateur in bee-caliform. It is anadsomely printed, neatly bound and is a credit to the West.—Western Agriculturist.

They were an indeptibility the most on allege.

to the West.—Western Agriculturist.
This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the aparty. There is no subject relating to the culture of bees left unto cheel, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowlede of aparities which he uses admirably to promote and make popular this most interesting of all occupations.—American Inventor.

It may safely be reconsisted.

interesting of all occupations.—Américan Inventor It may safely be pronounced the most complete and comprehensive of the several minuals which have recently appeared on the subject of bees and their handling in apaires. The studies of the structure of the bee, the different varieties, the points of minuagement, extending to the smallest decads, are all of high and practical value. Prof. Cook has presented the latest phreses of progressive bee-keeping, and writes of the themes discussed in the light of his own experience. Pactic Rural.

the light of his own experience. Pacine Raral, Of the many excellent works which we have eximined on bee-culture, we consider Prof. Cook's the most valuable for the study of those who consupiate going into the business or are already keeping bees. If thoroughly studied, and its teachings conformed to, by the apairst, who excresses a reasonable degree of common souse, he or she cannot fail to achieve at least a reasonable degree of success. The author at resses binself to the work with a degree of enthusism which curries the reader with him to the end. Konsas Farmer. Cook's Manual of the Abuny holds in America.

the reader with him to the end. Kansas Farmer, Cook's Manual of the Apuny holds in America the same high rank that is necerted in Germany to the book of which Dierzon is the author; the only difference being that Prof. Cook's Manual combines the protoundness of the German pastor with the superiority of the practical Ahierican. He refers in several instances to Dawin; and does not belong to that class which hates everytaing that is foreign, for he speaks of German naturalists with great reverence.—German Freidenker, Milwankee, Wis.

WEEKLY—(52 numbers) **\$2** a year, in advance Three or Six Months at the same rate.

SEMI-MONTHLY-The first and third numbers of each month, at \$1.00 a year, in advance.

MONTHLY—The first number of each month, at 50 cents a year, in advance.

Any person sending a club of six is entitled of an extra copy (like the club) sent to any address esired. Sample copies furnished tree.

Remit by money-order, registered letter, express or bank draft on Chicago or New York, payable to our order. Such only are at our risk. Checks on local banks cost us 25 cents for collecting.

Free of postage in the United States or Canada. Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

### Demand for Pure Extracted Honey.

From a recent number of the Farmer and Manufacturer we clip the following interesting item:

A commercial exchange says that e American honey trade with Great Britain is growing vapidly. A recent English order calls for 58,000 onepound cans of pure extracted honey.

Yes, and soon we will have ready foreign sale for every pound of pure extracted honey we can spare. The size and style of package is perhaps the most significant portion of the above item, as they indicate that the honey is wanted to retail for family consumption. Heretofore, the greater portion of extracted honey sent to Great Britain has been used for manufacturing purposes; now, however, since it is becoming a family staple, its popularity and the demand will be almost illimitable.

Again, it corroborates the policy the BEE JOURNAL has long advocated, viz.: That for a retail trade, neat tin eans and pails, ranging from 1 to 10 lbs., will be most eagerly sought for by the small consumer. Properly put up, of irreproachable purity, American extracted honey will in the near future become more popular abroad than the beautiful comb honey which has challenged their admiration, and at more remunerative prices.

### Sweet Clover as a Weed.

Mr. H. S. Hackman, of Peru, Ill. writes us the following welcome letter, dated the 15th inst. :

Please flud inclosed flowers of the sweet clover, picked from the road-side, on the prairie, yesterday, 14th inst. Sweet clover, as a weed! Although it has been growing in our roads, on waste land, along railroads, and on our hill-sides for 25 years, it does not seem to get into the fields, except where water has carried the seeds into low places.

I suppose I owe my wonderful summer success largely to the sweet clover. We had the hottest and driest season we ever had—no rain from June 15 until Sept. 15. The hotter and drier 15 until Sept. 15. The hotter and drier the more honey, seemingly. My loss last winter was 163 out of 165 colonies. last winter was 163 out of 165 colonies. I bought 8, and commenced this season with 10 colonies; my first division was June 12th. I divide by moving a strong colony, and start a nucleus in its place, with a full hive of combs and one frame of brood. This season I subdivided the nuclei when the queens were ready to hatch, say from 12 to 14 days, by giving each a brood comb again. In this way I have increased from 10 to 71 colonies, which could again. In this way I have increased from 10 to 71 colonies, which could only be done by dividing and subdividing. My hive is what I will call a systematized Langstroth, 14x14, and 1134 inches high, inside measure, holding of the colonies of the colonies. ing 9 frames. From a number of nu-clei, started June 12, July 6, 9, 17, etc., I extracted 60 lbs. of honey from the upper story, in September. Total honey crop for 1881, 1,000 lbs. extracted, 200 lbs coinb honey, and bees all strong and well supplied. and well supplied. I work on the tiering up plan. I have taken 40 full sheets of brood from my only surviving Italian colony, and yet it occupied 4 stories, containing 36 frames, and a case of sections again the middle of September. My other colony (blacks) wave not much helping this. Each I work on the tier were not much behind this. Each gave me 60 lbs. of extracted honey, which was taken off in September, after it was all finished.

From the time maple and fruit trees blossomed—say, May 1—until Sept. 15, we have had a constant flow of honey. Our principal honey-producing plants are fruit trees, white clover, basswood, sweet clover, wild cucumber and heartsease.

Seventy-one colonies from 10, and 1,200 lbs. of honey! Extraordinary! And yet, with Mr. Hackman's continnous honey flow, and his intelligence to make the most of it, his success this season can be made a matter of common occurrence. His intelligence can be acquired by most of us through thoughtful reading and practical experience, while the continuous honeyflow can be much more speedily and easily obtained. There are but very few locations in the Northern or Central States that are not already supplied with maples, fruit trees, white

clover or basswood (and each of the Southern States has some substitute for these), and judicious planting can easily be made to supply the balance of the season.

For most locations nothing will be found so available as sweet clover. Blooming early, as it does, it will divide the attention of the bees with white clover; a portion fenced off will afford a succulent, nourishing pasture for horses, cattle and calves till July 1st, or it can then be mown for bay. and be again allowed to sprout up anew and bloom continuously until winter, cheerless and cold, has with its icy embrace overcomes it. With but little care it can be made to bloom and yield nectar, except when rains are falling or during the prevalence of strong, adverse winds, from the middle of June till past the middle of Octobercertainly as long a period as our impatient little workers can utilize it; nor will it then cease to "waste its sweetness on the desert air," but after the advent of winter, when all else has passed into " the sere and yellow leaf," its modest flowers will waft a fragrant good-bye to the bee when on its last flight, and leave pleasant memories for its long winter dreams.

We thank Mr. Hackman for his testimony, corroborating that of many others, that it is not an obnoxious Many have abstained from planting it because of the foolish and unfounded prejudice against it. On the confrary, it can be used to advantage as an exterminator of obnoxious weeds. Where dog-fennel pollutes the evening air with its nauseating stench, there scatter the sweet clover seeds and harrow them in; where ragweeds, wild buckwheat and burdocks make the fence corners and roadsides look hideous and slovenly, scatter the seeds and make the weary traveler glad in future years when its fragrance greets him, and you, reader, will feel grateful when you send the BEE JOURNAL your crop report reading tike the above -"120 pounds of honey per colony in the spring, over 600 per cent. increase, and bees all strong and heavy with honey." It depends on yourself to do so, not the bees.

Some time in October we were sent a purple specimen flower for identification, but the letter with the name and address of the sender has been mislaid. Prof. Cook says it is a the BEE JOURNAL on this subject. mallow, probably escaped from cultivation, as it is undescribed in Gray.

### Dr. Tinker's Golden Honey Plant.

We are frequently in receipt of letters of similar import to the following, which we have received from Mr. Louis Hofstatter, Louisville, Ky.:

Please give the common name of the so-called golden honey plant. It may be growing near many bee-keepers who will send money for the seeds, and who will send money for the secus, and by being posted through the proper channel—the BEE JOURNAL—could save their money, or invest it according to the value of the plant for their

We are not aware of any common name for the plant, and have no definite knowledge regarding it except that imparted from time to time in Dr. Tinker's correspondence. Prof. Cook, whom we have addressed for the common name, kindly answers there is none "except Actinomeris; it is a composite plant, near Coreopsis." How far it may be desirable to have it growing in the vicinity of farms and orchards we cannot say, nor do we know regarding its adaptability to certain soils and climates.

Early recognizing the vital importance of encouraging the cultivation and development of every species of honey plant, in order to determine the most available for certain soils and localities, as well as to secure a continuous honey flow, we have gladly availed ourselves of every opportunity for observation, and have taken every occasion to impress upon the apiarists of America the benefits of planting for honey. It should not be satisfactory to them that Dr. Tinker finds golden honey plant most desirable for his locality in Ohio, nor that Mr. Dodds is enthusiastic over cleome for Iowa, while Mr. Hackman attributes his wonderful success in Illinois to sweet clover. Planting, and what to plant, are problems which every beekeeper should, and eventually will, solve for himself, if he would make the most of his surroundings with a view to the greatest success.

The production, care, and sale of extracted honey," is a subject of much importance, and we are promised a series of articles on it from the pen of Mr. James Heddon, to commence in January next. That is the staple article, and to it we give special and critical attention. We are glad to welcome Mr. Heddon to a place in He has had much experience, and his articles will be valuable.

Floral Offering. -- Mr. E. Hoyt sends us a sweet clover bouquet from Highland, Madison county, Ill., gathered on the 16th inst., for which he has our thanks. We called our last flowers of the season on the 17th-of course, they were sweet clover. We want this fact borne in mind: That sweet clover can be made to bloom continuously, from the middle of June till as late as the bees can fly, and the honey from it is second to none.

We are sometimes asked who our authorized agents are? Every subscriber is such an agent; we have no others, and greatly desire that each one would at least send in one new subscriber with his own renewal for 1882. The next few weeks are the time to do this. We hope every subscriber will do his or her best to double our list for 1882.

Premiums. - Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2.-a copy of "Bees and Honey."

- 8, -an Emerson Binder for 1882.
  4, -Cook's (Bee) Manual, paper.
- 6.-Weekly Bee Journal for I year.

Or they may deduct 10 per cent in cash for their labor in getting up the club.

Another Explorer in Search of Forelgn Bees,—Sig. J. Fiorini, an Italian, and Messrs. D. A. Jones and Frank Benton, Americans, have, at great cost of money and hardships untold, obtained Cyprian and Syrian bees. and the latter has visited Ceylon and Java in search of Apis dorsata and Apis florea, and now Mr. T. B. Blow, an Englishman, is to start on a similar errand as will be seen by the following item from the British Bee Journal for November:

Mr T B Blow of Welwyn Herts expert of the Hertfordshire Bee-Keep ers' Association, intends to visit the East with the object of importing bees of the various Eastern countries. In this, Mr. Blow is animated with a patriotic feeling, as he thinks it is not desirable that English bee-keepers should be behind their American cousins. For some time past large con-signments of Eastern bees have been forwarded to America, and it is said they are much appreciated both for their working powers and their greater prolificness. Mr. Blow hopes to be able to bring over a large number of colonies from Albania, Dalmatia, Smyrna, Cyprus and Syria, and expects to start very shortly.

It is amusing to know that this journey is justigated by a "patriotic feeling," for "it is not desirable that English bee-keepers should be behind their American cousins!" As they were not in advance of Americans in this affair, where else could they be, "but behind?"

A Liverpool circular says that nearly 900,000 barrels of American apples have been landed this fall, and that good fruit is always salable and the demand without limit. The demand for American honey is also almost " without limit."

### MISCELLANEOUS.

Formed an Association.—The beekeepers of Marion Co., Ind., have lately formed themselves into a Society, as will be seen by the following from the Indiana Farmer:

A number of the prominent bee-A number of the prolitient bee-keepers of this county, met in the rooms of the State Board of Agricul-ture, pursuant to the call of C. S Schoueld, Vice President of the State Association, for the purpose of organizing a County Association. Sylvester Johnson was made temporary Chairman, and Frank L. Dougherty, Secretary protein. An organization was perfected, with the adoption of a suitable constitution, with rules and regable constitution, with rules and reg-ulations for the government of the so-ciety. The following officers were elected: President, Sylvester John-son; Vice President, Mrs. Cass Rob bins; Secretary, Frank L. Dougherty; Treasurer, Mrs. Stout. In a promis-cuous conversation, it developed that the bee-keeping industry in this pant at the State is in a fair condition deof the State is in a fair condition despite the drouth of last summer, there being quite a fair yield of honey reported. The meeting adjourned to meet on Saturday, Nov. 12, at the same place, at 1:30 p. m.

Detecting Glucose in Honey,-Prof. A. J. Cook, writes to the New York Tribune concerning some tests of adulterated honey:

I then tried the lime test as given by Dr. R. C. Kedzie, in his valuable report (see State Board of Health Re-port of Michigan, 1874, page 33). The behavior was in every case alike, as I added the oxalic acid. Evidently, glucose manufacturers had suc ceeded in removing all the lime. I next tested for that most burtful sub-stance, sulphuric acid. Every sample of honey remained perfectly clear as 1 added the nitrate of baryta, but every sample of glucose hung out a flag truce. Each called for quarter hrowing down a white precipitate. We have here two points of interest first, the presence of the poisonous sulphuric acid in these samples, which to all appearance was very fine. Surely, these are no lit food for man or bees these are no lit food for man or bees Secondly, we have an easy test for sulphuric acid, which, if not always present, is one of the most injurious substances when present, to be found in this abominable stuff, glucose. We have only to take a little intrate of baryta, and add to the suspected honey. If it remains clear, we surely know that there is no sulphuric acid present, and probably it is pure honey. But if it turns milky, it is to be thrown aside as containing glucose. be thrown aside as containing glucose, which in turn contain dreaded sulphuric acid. turn contains the justly

What a Honey Show has Done for Canada.-The Stratford, Ont., Beacon, remarks as follows on the result of the honey show at Toronto:

The busy bee occupies a larger place among the wealth producers of the countrymen than is generally supposed. Bee-keepers are invariably looked on as enthusiastics, and their pursuit smiled at as a sort of hobby that pleases them and don't do anybody any harm, except the unfortunates who happen to get stung. Yet the honey crop is an important item in the material wealth of this continent, and the total production aggregates an enormous amount. Glancing The busy bee occupies a larger place gates an enormous amount. Glancing through a number of the American BEE JOURNAL, a lively paper published in Chicago, we found a tabulated statement of the honey product tor 1881, which fairly astonished us. ted statement of the honey product tor 1881, which fairly astonished us. The figures were admittedly incom-

plete, indeed, the editor claims that they do not represent more than a 12th of the season's crop. Yet the surplus of the season's crop. A et the surplus honey accounted for by actual pro-ducers was no less than 9,467.622 lbs., worth at a low valuation over a million and a half of dollars. Canada stands third on the list, with a production of 1.173,625 lbs.

Regarding the profit of bee-keeping, there can be no doubt. The average rate of increase over the whole continent was 71 per cent., that of continent was 71 per cent., that of Canada being 91 per cent., while the amount produced by each colony of bees was 69 lbs. in the United States, and 96 lbs. in Canada. The splendid display of honey in all shapes at the Toronto Industrial Exhibition, called the attention of thousands of people to the subject of bee-keeping, who had hitherto not given it a thought, and the test of secretary with the test of the result will probably be a great increase in the number of apiarists crease in the number of apiarists next year. The simplies honey is now almost all exported, there being a constantly growing foreign demand. The home market is but scantily supplied as it is with the best grades of died, as it is with the best grades of butter and cheese, but there are few persons who have not a sweet tooth and who would not buy honey in considerable quantities if it were presented to them in neat packages and in nice condition. The demand is even now far greater than the supply, and could be increased almost to an indefinite extent.

The Honey Season in England, Scotland and Ircland,—The London Hosticultural Journal, gives the following summary of the honey season in Great Britain for the year 1881.

In the south of England and in the East Riding of Yorkshire, in Lincoln-German Ocean, bees on the whole have done well, and, so far as I can learn, the bee-keepers in those parts are satisfied with their barvest of honey. The bee and honey exhibitions in London and at Louth, Lincolnshire, were considered good and satisfactory. In many other parts of England, bees, during the hot weather in June, gathered great stores of honey, and thereby created great interest in apiarian circles and expectations of large profits; but in the flush and glut of honey from white clover, the weather became bad and did not improve till the clover season ended; and as hives were then full of bees, and as bees in summer need and consume much food, their large stores were soon made less During the last half of July and all August, bees lost weight very fast. Though the season has been encoura nonga one season has been encouraging from some points of view, it cannot be considered a first-rate one for honey in some of the midland and northern counties of England. The mainty of the honey taken, however, has been excellent.

The Scottish bee-keepers, who, dur-

ing the last dozen of years have been favored with some good seasons tor noney, while the English have had to contend against some very unfavorable ones, have this year been more un-fortunate than we, for the honey season in the north has been a failure. Even on the moors in Scotland this year, bees gathered little, if any honey at all. In the north of Eugland no heather honey has been obtained this

From Ireland, I have not had any particulars as to the success or non-success of bee-keepers there this year. I have seen some Irish honey of this season good enough of its kind, eviseason good enough of 1ts kind, evidently gathered from the yellow weed of cornfields, known by the name of Ketlock or field-mustard. This plant yields rather clear honey, with a greenish or yellowish tint, and does not taste well beside honey gathered from from the programme development. from fruit trees and clover fields. Though the honey of Ketlock is not first or second-rate, yet fie'ds of Ket-lock in the neighborhood of an apiary

fore the white clover comes into

flower.

We are glad that ISSI has given English bee-keepers some very good honey and great encouragement to look hopefully forward to future years.

Popularity of Comb Foundation .-Prof. A. J. Cook, in the New York Tribune, remarks as follows:

The use of comb foundation is finding favor abroad as well as at home. A British writer says, from experience the past season, that, "as a rule, colonies left to build their own comb. failed to more than half fill the bives, while even late August colonies on foundation, are as good as any." I tried the foundation in 1875, when first sent out by John Long, and then said it was a great discovery, and would revolutionize our methods in the apiary. Comb foundation has be-come a commercial staple in the United States, and the enterprising apiarist does not think of doing without it. Like many other recent inrentions, it is of very great use, and is doing its part to accelerate the pro-gress of this, perhaps, the most pro-gressive of manual labor pursuits.

The Texas State Bee-Kecpers' Convention will be held at McKinney, Texas, on Tuesday, April 25, 1882.

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, (Monday, 10 a. m., Nov. 21, 1881. )

The following are the latest quotations for honey and beeswax received up to this hour:

#### сителдо.

HONEY-The market is lively and prices steady. We quote light comb honey, in single comb oves, 18@210; in larger boxes 2c. fess. Extracted

BEESWAX - Prime quality, 186022c. AL. H. NEWMAN, 972 W. Madison St.

### NEW YORK.

HONEY—The supply is full, and trade is lively,
We quote as tollows: White come, in small boxes, 180, 202; dark, in small boxes, 150, 170. Exracted, white, 100, 110; dark, 70, 90.
BEESWAX.—Prime quality, 219,00,230.
THORN & Co., 11 and 13 Devoe avenue.

### CINCINNA''L

HONEY—Is in good demand, here now.
I quote: Good comb honey, in sections, is worth
isse20c, on arrival. Extracted, resecon arrival.
BEESWAA.—18822C, on arrival. I have paid
20c, per lb. for choice lots. C. F. MUTH.

### BOSTON.

HONEY.—1-pound combs are a desirable pack-ge in our market, and a large quantity could be old at 200-20c, according to quantity. BEESWAX—P incequality, 25c. CROCKER'S BLAKE, 36 Chatham Street.

### BALTIMORE.

HONEY, -But little on the market, and prices are not quoted.
BEESWAX - Southern, pure, 21@23c.; Western, pure, 2109 22c.; grease wax, 11c.-Bultimore Market Journal.

### INDIANAPOLIS.

110NEY.—New, in 1 or 2 lb. sections, 22@25c.— Indianapolis Stock Review.

### PHILADELPHIA.

HONEY,-The supply and demand are allke nominal.
BEESWAX — Best light 23@25c,—Philadelphia Merchants' Guide.

### SAN FRANCISCO.

HONEY—A sale of about 1/30 cases of choice extracted is reported at 84c, for export, an this may be said to very closely represent the extreme views of shippers. In a rebal way 18c, be, is realized, but sell, rs are more momerous than buyers. We quote white comb, 16c, 30c, dark togo d, 10g, 14c. Extracted, choice to extra white, 82[60]0c, dark and candied, 78c, BEESWAX—23c, 25c, STEARNS & SMITH, 423 From Street.

### ST. LOUIS.

HONEY.—Steady, with sale for all offered at quotetions; comb at 1860-290.; strained and ex-tracted, Sac 1800- top rates for choice put up in small packages suitable for retailing, BEESWAX—Selving B. http at 1960-296. R. C. Green & Co., 177 N. Main Street.

### CLEVELAND.

HONEY-We report the market quite active; all our sales this week of comb hones in 1 pound sections have been made at 22c., and two pound sections at 25c. Extracted has taken a start, and we report trade quite active in small pickaxes, 35-pound the cans, especially, at 12c. per lb. Extracted in bbis, continues dull BEESWAX-90ac29c.

A. C. KENDEL, 115 Ontarlo Street.

#### The Three-Band Test Again.

G. W. DEMAREE.

Mr. Doolittle's article on page 285 AMERICAN BEE JOURNAL, discussing the subject indicated by the above caption, I think deserves more than a passing notice. For, if a writer of the abservation and experience of Mr Doohttle, after discussing the subject at some length, apparently decides to have the matter unsettled so

far as he is concerned.

I presume the question is fairly an open one. He commences the dis-cussion by quoting Language found in cusson by quoting language round a tormer article of mine bearing on this subject, and gives Mr. A. l. R oot's answer to it, viz: That "such is the test that must be applied to the progeny of some queens imported directly from Italy in order to see the three yellow bands." Why does not Mr. Doolittle answer the question him-Doolittle answer the question limself? He is as competent to do so as Mr. Root is. I believe it is true that he has not written a book as the latter gentleman has done. Good old Job expressed regret in pathetic language that his adversary had not written a book. I suppose Job thought that if his adversary had written a book, he would therefore have been mable to wriggle and twist about, when he had would therefore have been amable to wriggle and twist about, when he had him in a close place. Air. Root has written a book, and when he gets into trouble, he must abide by what is found in his book. Mr. Doolittle is at more liberty to shift grounds and wait

more morely to sinit grounds and wait for something to turn up.

Mr. Root is doubtless correct when he says "that the progeny of some queens directly from Italy must be queens directly from fany must be placed on a window in order to show the three yellow bands." And he might have gone further and told us "that the whole of the progeny of some queens imported from Italy do not show the three-bands at all, for the simple reason that they are not there." I have seen at least one such imported queen, and others can bear

testimony to the same fact.

But Mr. Root contends that just so a queen hails from Italy, she is pure ex necesitute rei. Of course if this view of the case is accepted, we must have some test that can be adapted to the

some test that can be adapted to the bees, and I know of nothing better than the window test.

In the spring of 1880, I prepared a small room so as to be made perfectly dark, except a window 10 inches square, and while my bees were working on the maple, I tested a great number of them, and I found that the preparest hybrids would show the third meanest hybrids would show the third band in splotches, and broken lines, and in some cases in mere specks. Will gentlemen tell as just how much Will gentlemen tell us just how much of the third band should be visible to pass the bee as "pure?"

Mr. Doolittle discusses the subject

pass the bee as "pure?"

Mr. Doolittle discusses the subject logically and conservatively, but he leaves it unsettled so far as his views are concerned. It is true he says: "I claim every bee should show the three-bands while standing on the combs, to be such bees as I should want to breed from." Right here I agree with him to a dot. I meant no more than that by the expression "under all circumstances." If he had stopped here, there would be little doubt as to his position. But he concludes by saying: "As far as my experience goes, I have vet to see the queen whose progeny show the three-bands under all circumstances."

It may be obtuseness in me, but I am unable to reconcile the two statements. Perhaps friend Doolittle can do better with them than I can. At any rate, it appears that he has never had the pleasure of seeing the linest specimens of the yellow race of bees. Mr. Dadon, thinks that I am eager to

sure him that he is mistaken in his ideas concerning my position relative to the several races of bees. I am the enemy of no race or type of bees under the sur. I can handle and make subservient to my will any bees I ever saw. But there is room for selection, and I want the best that can be had. It seems to me that any man looking coolly at the language used by me, when noticing the deadly thrust aimed when noticing the deadly throust affine by Mr. Dadant, at the untried stran-gers from the Island of Cyprus can see that my intention was to joke and worry him. But he asks me if it "would have been more honest to keep on selling them without saying a word about their irrascibility?" I answer, certainly not; and further, that if he has been advertising and selling if he has been advertising and selling to his customers a worthless thing, tomesty demands that he should not only give warning, but refund the money in every case where he has made a sale. What would you think of a man who would sell you an article and then notify you that the thing was worthless, and that you had better that it have some time keep. was worthless, and that you had better let it alone, and at the same time keep your money? I am only supposing a case, for Mr. Dadant has done no such thing. The Cyprian queens that he has sold are worth the price he charged for them. If pure, they are in no sense, except the good trait of quietness, inferior to the Italians, and in some respects they are superior to them.

Mr. Dadant seems to think because Mr. Dadant seems to think because I keep a small aprary, and have bought no bees from him, I draw upon my imagination when I write on the subject of bee-enlture. This is a remarkable conclusion. It is true, I keep a small apiary, and keep it for observation and study. Perhaps I can find as much time when not engaged in my professional duties, to study the habits and natural history of the bee, as Mr. Dadant can spare for the same Mr. Dadant can spare for the same purpose from the labors necessary in his line apiaries. I have heard of Mr. Dadant for a long time, and I owned have heard form I bell any browledge of bees before I had any knowledge of his existence. But time don't make men. It is brains and close applica-tion that fit men for the duties of life. whatever those duties may be. I take a broader view of the subject under discussion that Mr. Dadant is able to comprehend, at least it appears so.

To talk about the "leather colored" bees being a distinct type or strain of talians, is simply nonsense. I have yet to see the queen whose royal progeny do not show more or less the outcropping of the two so-called strains. Mr. Dadant says that I don't "speak from experience," because I have never bought a queen from him. This is the most remarkable of all the remarkable things that he has said while discussing this subject. Does Mr. Dadant pretend to say that bees of his importation differ materially from those imported by other persons from the same place? Why, bless his soul! With all my "eagerness" for war on the "leather-colored Italians," I have never seen the time since I commenced the culture of the yellow race of bees that I did not have Italians, is simply nonsense. I have yellow race of bees that I did not have the so-called leather-colored Italians in my apiary.—Have found it next to in my apiary. I have found it next to impossible to suppress them. Nothing less than the cruelty and craft of Herod the Great, who slew all the children from 2 years old and under, could suppress them.

If Mr. Dadant's customers had de-If Mr. Dadant's customers had demanded of him pure yellow bees, instead of ordering them under the flexible nomenclature Italians, he would not have been able to fill one order in a half dozen. This is why "some people" may suspect that the wonderful power called selfishness may move the best of men.

I hold that the hive bee (Apis meli-It may be obtuseness in me, but I am unable to reconcile the two statements. Perhaps friend Doolittle can do better with them than I can. At any rate, it appears that he has never had the pleasure of seeing the linest specimens of the yellow race of bees. Mr. Dadaut thinks that I am eager to make war on "dark Italians." I asfica), is divided into two distinct fam-

shape as possible. The two races are distinguished one from the other chiefly by their color; the one is yellow, and the other dark or black. Now, when we see bees of an intermediate color, do we not reason from cause to effect when we call them bybrids?

I have felt a deep interest in this subject, and while I may ma jocular way say some tough things. I have all due respect for the opinions of

### Pollen and Dysentery.

A. R. KOHNKE.

Prof. Cook's statement in No. 41 of the BEE JOURNAL, page 826, is as follows: "That pollen was in many cases injurious to bees in winter, as it had a tendency to unseasonable breeding, and hence was the cause of much spring dwindling," Put the other way: Spring dwindling is caused by unsea-sonable breeding, and that is induced by the consumption of pollen in moderate or immoderate quantities, which-ever way you may choose to put it. What I especially wish to emphasize is, that the bees did not take to unseasonable breeding on account of a moderate or immoderate consumption of pollen, and that the presence of pollen is not and cannot be the direct or inis not and cannot be the direct or in-direct cause of spring dwindling, espe-cially not of dysentery. Unseasonable breeding may be the cause, which in turn is the effect of a problematical cause. Even the expression, "msea-sonable breeding," I doubt very much as correct. I have seen bees rear brood by the middle of February in the protherstern part of Germany in the northeastern part of Germany, the winters there being as severe as in any part of Michigan or Wisconsin, though not much spring dwindling or dysentery is known in that part of the

ownery is known in that part of the country.

Now, I will take a step in the opposite direction, by saying that the absence or deficiency of pollen in winter causes dwindling and dysentery in spring, to prove which I will quote Berlepsch, who says as follows: "In 1865, for the sake of an experiment, I wintered a very strong colony without any pollen, but plenty of honey, and in the spring of 1866 it was the only colony among 70 which showed signs of restlessness and dysentery."

Youngstown, O.

### Facts About Honey Plant Culture.

W. T. STEWART.

Having had many letters of inquiry taving had many letters of inquiry concerning the plants named in my article read at the Convention at Lexington, I shink best to answer all at once through our much loved AMERICAN BER JOHENAL; by so doing, I can probably answer many queries that will benefit bee-keepers generally

erally.
The Simpson Honey Plant (or figwort) is very hard to propagate from the seed; the only successful way that I know of is to sow the seed in a rich plant bed early in the spring, and when well up, or in the fall, trans-plant in the field, 4 feet apart one way and 2 feet the other. It will not do to sow with wheat, etc. I have a fine lot of young plants this season in plant

Motherwort will come from the seed sowed broadcast with wheat, or any other way that is most convenient. orther way that is most convenient, provided the ground is loosened a little; nearly every seed will grow, too. It is best to sow early in the fall, but it will do any time in the warm season. I have millions of it now, 4 inches high, sown last September; it

Let us put the matter in as simple a it growing from the seed saved this

Melilot is best sown in the fall, but

Addition is best sown in the fair, but will grow any time or anywhere, except on a flat rock.

Motherwort, figwort and catnip are very easily cradicated when wanted no longer; at least so as not to interfere with any crop. Melilot will eradicate itself by not letting the seed vision.

ripen.

I have no seed of any kind to sell this year, having sown them all for my own bees. Next year I shall save seed to sow in other locations. I suppose some of the dealers have meth the for sale, as it is the most useful thing in the business. Ask A. H. Newman, of Chicago, Ill., for the seed, If you don't get the seed, get a few plants and raise your own seed; few plants and raise your own seed; that is the way I done it. Set the plants now, or in the spring either; melilot does not do very well to trans-

plant, unless very small.

The bee man within hearing of the bells of Eminence, that the Cyprians whipped out, mentioned in AMERICAN BEE JOURNAL of Nov. 2. is out on duty. He sent to D. H. Pike for some Albino queens, and killed his Cyprians, and 1 am right glad the thing hapand I am right gad the thing hap-pened before I got any of the blood into my apiarry, for it was only 3 miles away. Peace is again restored on this line about Eminence apiaries; only one man has the Cyprians now, near here, and the indications are that he will be cured next spring. Eminence, Ky., Nov. 5, 1881.

For the American Bee Journal.

### The Knowledge Possessed by Bees.

T. C. STARR.

Do bees know what is going on throughout their own hives, and eathey communicate with each other?

Last April I had occasion to transfer some bees from box hives to movfer some bees from box hives to movable frame hives; the latter were arranged for two sets of frames, upper and lower. In transferring, the combs were placed in the lower story, and the upper space left vacant, no empty frames being placed therein.

The bees were driven out of the old hive into a box, until the combs were transferred to the frames and placed in the bive, when the top, or movable

in the hive, when the top or movable corner was removed from the hive, and the bees shaken out of the into the hive on to the frames of honey and brood; the corner was then put on

the hive, and to all appearances the bees were doing well.

In about a week I examined the frames (from a side door in the hive), to see if the combs were fastened, in order to remove the transferring wires, when I was surprised to find many bees clustered and hanging to the corner of the hive, and on examination of the combs. I found no eggs therein, but some 15 queen cells already far advanced towards capping.

I then examined the cluster of bees hanging to the corner of the hive, and found they had started combs, every cell almost of which was occupied by eggs and larva, proving that the queen was in the eorner; that when shaken into the hive, she had crawled up-ward instead of going in among the combs covered with honey at the

There was only the one entrance to the hive, and every bee that went ont of the hive from the place where the queen was, had to go down through the combs and also return through them. If they can communicate with each other, why did they not entice the queen down among the combs? or, why did the bees among the combs rear queens, if they knew their queen vas only a few inches above them in their hive.

What is the difference between Italians and Palestine bees? We have quite a good many Italians here, in this part of the state, and I like them very much, but as our country and climate resembles Palestine so much, would it not be likely that they (Palestine bees) would still do better? I see they are highly recommended, but

have seen no description of them.

My bees have made no surplus honey, but are rearing broad now, and have honey enough to winter well, I think. I increased by natural and arthink titicial swarming from 20 to 37 colo-

The BEE JOURNAL is a most excellent paper, and I could not possibly do without it, many single copies being worth more than the year's subscription. Please put me down as a life subscriber, for I do not wish to miss a circle number. single number.

San Bernardino, Cal., Oct. 3, 1881.

### Moth-Trap Hives.

W. H. ANDREWS.

The following criticisms in a Southern paper is from the pen of a veter-

ern paper is from the pen of a veteran patent moth-trap vender:

I have noticed in the Louisiana Democrat a letter of Judge Andrews, of McKinney, Tex., copied from the AMERICAN BEE JOURNAL, in which a very ludicrons comparison is made between the depredations of buzzards upon cattle, and those of moths upon bees. He says: "Can we manage cattle so the buzzards will not destroy cattle so the buzzards will not destroy them?" I answer, yes; give them cattle so the ouzzards will not destroy them?" I answer, yes; give them good pastures in summer, spring and fall, and supply them with an abundance of forage during winter. Keep them fat, and there is little danger of buzzards. Now it is true that the Judge's so-called harmless moth self-during the strong and hardless. dom attacks the strong and healthy colony of bees; but unlike the buzzards, they do not wait for their prey to die. When the bees become weak, they are liable to be attacked by moths, while the buzzard feeds only upon carrion. The moth feeds upon the wax, while the buzzard feeds only upon carrion. The moth feeds upon the wax, depriving the colony of a receptacle for honey, and the queen of the cells in which to lay her eggs. The duration of life of a working bee is but 70 days, consequently, if the queen has no place in which to deposit her eggs, the colony soon will be exterminated in the pratural erder of things. the colony soon will be externibated in the natural order of things. When the hive is guarded by a "reliable moth trap," protection is afforded against these invaders of the hive, and as any impartial or unbiased mind will see, and admit, they may continue their according to the product of tinne their operations unmolested.
J. F. VAN HORN.
Alexandria, La., Sept. 15, 1881.

In reply, I have this to say:

In reply, I have this to say;
The Captain quotes (as a question propounded by me), "Can we manage cattle so that the buzzards will not destroy them?" And he answers, "yes," and proceeds to tell us how it can he done. Now the course of the Captain's position is that unless cattle are tain's position is that unless cattle are thus managed, the buzzards will destroy them. Destroy cattle, Captain, or only eat up their comparatively worthless carcasses? But the Captain says: "Keep them (the cattle) fat, and there is little danger of buzzards." Then Captain, there is some danger, though our cattle are "strong and healthy." Now, you have traveled all over Texas, and likely know wherein this "danger," though little it be, consists. Tell us.

The Captain says further, "Now it is true that the judges, so-called, harmless moth seldom attacks the strong and healthy colony of bees, but unlike the buzzards, they do not wait for their prey to die."

colony of bees," I take it that the buzzards and the moth are about alike. comparatively harmless.

But the buzzard does not always "wait for his prey to die." I have seen him pluck the gleamy, sightless eye from its socket while the cow was yet alive; but this was only an innocent mistake on his part, for he thought she was dead—he thought she was surely "carrion." The Captain is right when he says "the buzzard feeds only upon carrion." and so he is when he says in the part senzard feeds only upon carriou." and so he is when he says in the next sentence, "the moth feeds upon wax, etc.. and he might have added, "and wax only." So I prove by the Captain, upon cross examination, that it is absolutely true that the wisest cattle man of Texas cannot "manage cattle so that the buzzard will not destroy them," for the reason that "the buzzard feeds upon carrion," not upon cattle, and in like manner, I prove that even Mr. Langstroth could not "manage bees so that the moth will not destroy them," for the reason that "the moth feeds upon wax," not upon bees, any more than the buzzard feeds upon the gamboling, bellowing ox.

neor than the observant reeses, any more than the observant reeses appoint the gambolling, bellowing ox.

And I prove also that the moth is only a bee-moth, "so-called," for it does not feed upon bees, but "upon the wax," and I will add, whether "the wax," be inside of a bee hive, or at the top of a charge, or in the contract of the on the top of a church spire.

The Captain says: "The moth feeds upon the wax depriving the colony of a receptacle for honey, and the queen of the cells in which to lay her

Now, with full confidence in my position, and due respect to all, I challenge Captain Van Horn, and all the other itinerant moth-trap venders of North America, to show that the moth ever trenched upon the precincts of the brood chamber, or even encroached

the brood chamber, or even encroached upon the confines of the comb occupied by the colony.

The Captain says: "When the hive is guarded by a reliable moth-tray, etc." I do not desire to infringe upon the right of the patentee of this statement, unless it be an infringement to say that the great Creator of all things (except moth-traps), in His infinite wisdom, ordained before the foundation of the world that no such thing as "a reliable moth-trap" should ever be invented, much less, patenever be invented, much less, paten-

### Experience of a Beginner.

PROF. S. J. ROBBINS.

I like the BEE JOURNAL very much. I look for it with more interest than any other I take. I bought 10 colonies of bees last spring. I rode many miles to find them, that I could buy at annes to and them, that I could buy at any price, for bees nearly all died about here last winter. Most of the bees I bought were in box hives. Mrs. R. and myself transferred them to movable comb hives. They were all weak colonies when we bought them. They seemed to be very thankful for their new homes, and built up fast; we did not allow them to swarm. we did not allow them to swarm. They made comb honey enough to pay for themselves and their new hives and all the comb foundation, tools, and all the comb foundation, tools, bee papers, etc., and quite a little margin left. I put two-pound sections on the hives for them to work in. After they were filled and glassed, Mrs. R. papered the boxes nicely, and they looked very attractive. I sold most of the honey at 25 cts. per lb.; some of the dark at 22 cts. per lb.; could sell much more if I had it. This is not called a good honey year; the drouth cut off all fall supply. My bees are in good condition, except one colony, which has no queen. I have been expecting one since July. I sent for two and got one. I would like toask if my experience is common among bee men. In July, I sent to a queen-breeder for unlike the buzzards, they do not wait for their prey to die."

Now, if fat cattle are in "little danger of buzzards," and if the "moth ger of buzzards," and if the "moth seldom attacks the strong and healthy are the common among one men.

In July, I sent to a queen-breeder for the trong light (drone's semen) white with royal jelly (drone's semen) white in the larval state."

I packed some of my bees that way in the larval state."

I would like to have Mr. Robinson the queens this week." One came, seplain how this "drone semen" is stands through the whole winter. I

when her bees began to mature, they all proved to be drones. I took her out and killed her, after advising with out and khot act, word came again:
"I will send you? queens very soon."
One came, not two. It is introduced One came, not two. It is introduced and doing finely. I am now unable to get any answer from the man, whatever. And again in July I sent to an activities of the property of the control o ever. And again in July I sent to another party, who edits a monthly bee paper which I subscribed for, and would take if I could get it (the September number not having arrived yet), for nuclei colonies of bees, according to his advertisement. I did not get an acknowledgement of the money. I wrote several letters and sent one telegram, all of which were not answered. After 30 days I sent to the postmaster who paid the money order, and with his help, I got the money back. What I wanted to do was to get nuclei and queens to use in money back. While I willied to do was to get nuclei and queens to use in dividing. As it is, I have worked faithfully from July till now in two directions, and have only been able to get one barren and one fertile queen I live 3 miles from the post office, and 4 miles from express office, and I have traveled miles enough expecting to find those bees to have paid for several colonies, if I had been allowed mile-age. Now if this is the ordinary way age. Now if this is the ordinary way men do business who rear bees, I want to know it. Will some one please tell me through the JOURNAL about what are the appearance and good quali-ties of Hungarian bees? Penfield, N. Y., Oct. 7, 1881.

[Such things are very reprehensible, and any queen breeder who does not till his orders promptly, or at least reply to inquiries after receiving the money for queens or bees, should be driven from the business, giving place to honest and honorable men.—ED.]

For the American Bee Journal.

### Description of Cyprian Bees.

L. A. LOWMASTER.

Cyprian bees are very light colored, the ground color being a yellowish brown; the three orange-yellow bands are broad; the 4th, and even a 5th are broad; the 4th, and even a 5th yellow band being generally visible when the bees are well tilled, while the underside of the abdomen is yellow to the tip, which is black; the cresent-shaped shield on the thorax, between the bases of the wings pointing forward, is very prominent and yel-

Between Cyprians and Italians, when not filled with honey, there seems to be little difference as to size and shape, but when both have their

seems to be little difference as to size and shape, but when both have their honey sacs distended, I think the Cyprians are longer, and presents a slightly more slim appearance.
Cyprian queens average smaller than Italian queens, and have long, slender, nicely-pointed abdomens. The diligence of the Cyprian is at least equal to the Italian; indeed, as regards economy within the hive, the former have the preference, because they are less inclined to build dronecomb. In their purity they are certainly more beautiful than the handsomest Italians. Those who visit my apiary are always much surprised when strong colonies of these beautiful bees are opened, and masses of bees roll out so peacably. When rightly handled, they are neither more nor less inclined to sting than the Italians. Italians.

In the collecting of honey the Cyprians are very diligent. They appear to be discreet in the occupation of combs, already built with the broad and honey, and only after that to de-yote themselves with full zeal to the

vote themselves with thir zear to the building of new comb.

On page 268 of the American Bee Journal, Mr. C. J. Robinson, said:

"I claim, as set forth in a former article, that queens are impregnated with royal jelly (drone's semen) while in the lawred state."

bees get it? According to his theory, bees get it? According to his theory, drones from a pure Italian queen would be pure blacks, if the "drone semen" was from black drones; and if the queen mated with a pure Italian drone, the bees would be pure Italians, and the drones would be pure blacks. This would be a fearfully mixed up progeny! Suppose that there were no drones until the queen wassealed up and none of the "semen" could be obtained, then, of course, the queen would lay no eggs that would queen would lay no eggs that would produce drones. We could not rely upon the purity of the drones from an Italian queen. We want facts, not guess-work.

Belle Vernon, Ohio.

### For the American Bee Journal. Pollen for Brood-Rearing.

C. J. ROBINSON.

Prof. Cook, in the AMERICAN BEE Prof. Cook, in the AMERICAN BEE JOURNAL, says that "breeding can only be carried on when there is pollen in the hive." This statement datly contradicts one made by me, on first page of the BEE JOURNAL for June 29th. I there say: "They are certainly wrong who say that pollen is indispensable to the raising of young bees." It now should be determined whether Prof. Cook made an erroneous statement relative to pollen being about the professional contraction. statement relative to pollen being absolutely necessary as a nourishing diet softlery necessary as a nourishing flet for larvae brood, or whether I am guilty of the error. Both statements, pro and con, stand upon the pages of the BEE JOURNAL as recorded facts, and one or the other should be wiped out. I do not presume to know how Prof. Cook's base belows without verying

Cook's bees behave, when rearing brood, but I do know that my bees Cook's bees behave, when rearing brood, but I do know that my bees raise brood, when required, without a particle of pollen; and I venture the assertion again that any and all domesticated bees, other conditions being favorable, will rear brood just as readily and equally as well without pollen, as with it. It is not a difficult experiment to test the question at issue. I offer the testimony of one reliable witness to coroborate my side of the issue, and then rest my case, allowing it to go to the jury (readers) to pass upon, and award their verdict in favor of the party in the case whose statement is correct and true.

Prof. Hasbrouck, the witness offered, says: "I have had, as an experiment, abundant of brood raised by bees shut up on new comb and fed on refined sugar syrup, when they could not possibly get a grain of pollen from any sonrce." This is given in the Bee-Keepers' Magazine for December, 1880, page 265.

This evidence closes on my part, unless Prof. Cook in his defense sets up a cross action and affirms new issues; in that event I may offer re-

up a cross action and affirms new issues; in that event I may offer rebutting evidence. I hope that Prof. Cook will not allow the case to go by default on his part, nor attempt to

rove an alibi. Richford, N. Y., Aug. 26, 1881.

For the American Bee Journal. Packing Bees for Winter.

R. L. AYLOR.

Bees in line condition for winter; I did never have my bees in as fine condition for winter as I now have them, since I have been in the bee business. I have packed them with from 25 to 35 lbs. of fine honey all sealed over, and without any cider in the hive, as there

were but few apples in this neighborhood for bees to store cider from.

My way of packing bees this winter is with 3 sticks laid across the frames. is with 3 sticks and across the frames. X inch square, coffee sacks on top of the frames and sticks well fitted around, and two of the outside sacks on top of it, closing the entrances except about one and one-half inches for them to pass, as opportunity may afford, and for ventilation.

I worked some of my bees that way

only lost 3 colonies out of 21, and some abnormal condition, and the queen honey producing counties of Southern ony tost of colonies on of 21, and some donormal condition, and the queen hive, with plenty of honey to have wintered them, had it only turned warm enough for them to have changed their cluster to where the honey was; but it was too cold, and starvation was the result.

This was a rary room honey was as the either of their characteristics, I should consider it very much against them. With honey

This was a very poor honey year, as the drouth burnt the white clover up just as it was about to bloom, and hees gathered no honey from that source; they did well on linden for about 12 days; the goldenrod was also burnt up the same as clover, but my bees stored enough of it for winter.

stored enough of it for winter.

I have 18 colonies this fall; they gathered about 700 lbs, of surplus honey, and I have sold nearly all of it at 15 and 20 cts, per pound. It is no trouble for me to sell the extracted honey at my store for 15 cts, per lb, while comb honey drags at 20 cts, per lb. So next year I will run them for extracted altograther, as my custom extracted altogether, as my custom demands the extracted in preference to comb at the same prices.

Waterloo, Ky., Nov. 14, 1881.

For the American Bee Journal.

### Distinctive Features of Cyprian Bees.

W. J. DAVIS.

I have watched with much interest all that has been published in the Journal about the Cyprian and Palsouth AL about the Cyprian and Patestine bees, probably the more so from remembering the verdict of both American and European apiarists of the ill-favored Egyptian bees.

While I would be glad to see any improvement in our bees that will add

desirable traits, either in the way of beauty, docility of temper, or in-creased stores, it is well to remind bee-keepers not to act rashly, and the precipitous haste with which the new intried varieties are scattered through the land, speaks more loudly of our

enterprise than our discretion.

For the past 15 years I have been breeding the Italians exclusively, and have been breeding for the "coming bee." While I have not deemed it necessary to make public every step taken, or the granual gained, yet as taken, or the ground gained, yet as the years have come and gone, they have left their lessons, and much of anticipated results of careful breeding. I have well nigh obliterated the vindictive temper of other years, so that my family and visitors can walk through my bee garden with safety. I open my hives without the use of smoke, and show the queen, combs and their contents to visitors, both male and female, and I do not recall a the past season. Unlike one of your correspondents, I breed no queens from cross colonies.

The proper age of queen to breed from, the strength and longevity of her worker progeny, are important factors in the calculation, as also length of tongue. The latter I determine, not by stretching the measuring line upon the lightle of a bee-corpse, but by the actual telling work done on the blossoms of real glover. It has on the blossoms of red clover. It has been a matter of surprise to me, that any one who has visited fields of red clover when in bloom, in any locality where Italian bees are kept, should question their ability to secure honey from that source.

There is a vast difference in the intelligence of bees. Pure Italians more readily understand their surroundings, and accommodate themselves to circumstances, than black bees, in the state of the surroundings of the surroundings. as in artificial swarming, change of entrance to hive, or in uniting colo-nies, and in many other ways. They know when to commence, and when

know when to commence, and when to cease rearing brood.

In your issue of Nov. 9, Mr. E. A. Thomas says "that his Cyprians have 4 and 5 combs of sealed brood and larva." That may do for his locality, but here in Western Pennsylvania, near 42° North latitude, I should say we want no unhatched brood in our hives on the first of November and if hives on the first of November, and if I should find one of my colonies with

as the ultimate object of bee-keeping, I will here remind bee-keepers, that very late or excessive breeding at any time will not be traits of the "coming

Youngsville, Pa., Nov. 17, 1881.

### California District Convention.

Met at Los Angeles, Cal., Sept 8, 1881, the President, J. E. Pleasants,

The minutes of the last meeting

The minutes of the last meeting were read and approved.

The following were admitted to membership: W. W. Bliss, S. N. Wickoff, C. N. Swenson, R. Hall and J. H. Book. Mrs. Wickoff was made an honorary member.

Mr. Haskell stated that he had not received the draft of the Constitution.

received the draft of the Constitution and By-Laws from the former Secre-tary, and on motion, Mr. Levering, as the committee, was granted one day

further time.

Mr. C. N. Wilson moved to elect officers on Friday and to hold the meetings annually during the fair week, instead of semi-annually. Carried.
Mr. Haskell's report as committee

on quotations of extracted honey was read and placed on file.

The finaucial report was submitted, showing \$1 due the Treasurer.

Adjourned to 10 a. m.

### SECOND DAY.

Called to order by the President: the Secretary being absent, J. W. Wilson was elected Secretary pro tem.
C. N. Wilson moved that the Secretary be instructed to have circulars

printed relative to strained and ex-tracted honey, including the report of Mr. Haskell, and furnish each of the leading papers of the Pacific Coast with a copy.

The report of the Committee ap-

pointed to draft a law relative to the protection of bees from foul brood, was read and adopted.

The constitution and by-laws were

The constitution and by-laws were criticised, and a committee consisting of J. W. Wilson, C. X. Wilson and Robert Hall was appointed to draft new ones, embodying the main ideas of the old ones, but amending where defective, and to report to the next meeting. meeting.

Adjourned to 2 p. m.

### AFTERNOON SESSION.

The President called the meeting to order and Mr. Levering moved to post-pone the election of officers until to-morrow morning. Carried. J. W. Wilson moved to postpone all

essays until to-morrow a.m. Carried.
The Association authorized Mr. N.

I should find one of my colonies with the amount of brood he speaks of at that date, I would say they were in an interest of the amount of brood he speaks of at that date, I would say they were in an interest of the speaks of at that date, I would say they were in an interest of the speaks of at the speaks of at the speaks of at the speaks of at the speaks of at the speaks of at the speaks of at the speaks of at the speaks of at the speaks of the speaks of at the speaks of the speaks of at the speaks of at the speaks of the speaks of at the spe

California, for the purchase, and sale of honey.

Moved by Mr. Swenson, and ear-

ried, that a copy of the above be sent to the British Ber Journal for publication. Adjourned to 10 a. m.

#### MORNING SESSION-SEPT. 10.

President Pleasants called the meeting to order, and the minutes of pre-vious sessions were read and ap-

The memorial of the Board of Trade with bill for the prevention of adulteration of food and drugs, was presented by Mr. Levering, who moved that a copy of such be sent to each of the County Associations of Southern California, to Food at the writer the sent to be sent to each of the County Associations of Southern California, to Food at the writer the sent to be 
ifornia as far as they will go.

President Pleasants then delivered his annual address, as published in the BEE JOURNAL for Nov. 9, on page 357, for which he was accorded a vote of thanks. It was ordered to be of-fered for publication in the Scmi-Tropic and other city papers.

The election of officers resulted as

follows: J. E. Pleasants, President; J. E. Pieasants, President; J. S. Harbison, J. Anderson, J. W. Wilson, Wm. Muth-Rasmusen, R. W. Wilkins, Frank Flint, S. N. Wickoff and Mrs. E. W. Steel, Vice Presidents; W. W. Bliss, Secretary; Robert Hall, Transparer, Adjourned to 120 p. Treasurer. Adjourned to 1:30 p. m.

#### AFTERNOON SESSION.

President Pleasants called the Association to order, and J. W. Wilson asked how many colonies of bees could be kept in one place to advan-

R. Bailey gave his experience from 1868 to the present time; he found that he obtained about as much honey from 200 colonies of bees as he did from 400. on the same grounds.

W. W. Bliss thought that 75 colonies was enough to be kept on one section of land.

Mr. Wiekoff said they had not enough

bees yet to over-stock his vicinity.

Mr. Levering said it was an unsettled question; he doubted the over-stocking theory, especially in this country.
C. N. Wilson thought it depended on the locality; he was of the opinion

that 150 colonies to the square mile, was enough on San Fernando range.

An essay was read by J. W. Wilson, a strained and extracted honey, for which he received a vote of thanks from the Society, and was requested to furnish a copy to the Semi-Tropic California for publication.

C. X. Wilson proposed a discussion on honey-producing flowers, which was on honey-producing flowers, which was participated in by himself and others; he recommended the planting of the black cassia, as it blooms the second year, and is a good honey-producing tree. He next recommended the planting of the blue gum, as his observations have convinced him that it is a large honey-producing tree, and not injurious to the bee; it blooms very early in the spring; he also recommended the planting of sweet corn, and next mignonette. He exhibited and next mignonette. He exhibited a specimen of the Dortlesia, an insect that is thought to be a formidable enemy to the orange tree and to other honey-producing plants.

Mr. Hall recommended the planting

of sunflowers. C. N. Wilson said that the seeds are good for chickens, and the stalks make good kindlings.

good kindlings.

Mr. Bailey said he had good success with buckwheat and mignonette; he gave the latter the preference.

Mr. Anderson said the wild horehound, from what he had seen, was a good honey-producing plant, and easily raised; he had also sown buckwheat in July Augustand in July, August and September; none produced honey except that sown in September.
C. N. Wilson thought that we might give it a trial.
Mr. Bliss inquired if any one had tried white mustard?
Mr. Wight found that he had this

Mr. Wickoff said that he had this year, with good success.
C. N. Wilson recommended planting

Mr. Bliss exhibited his comb foun-

Art. buss exhibited the comb foundation mill and explained its use, which was quite interesting.
C. N. Wilson offered the following resolution, which was adopted:
Resolved, That a vote of thanks be tendered the Council of the city of Los Angeles, for the use of their hall during the present session of the District Bee-Keepers' Association.

Adjourned to meet at the eall of the President.

W. W. Bliss, Sec.

### Michigan Bee-Keepers' Association.

The 13th annual meeting of the Michigan State Bee-Keepers' Association, will be held in the City Hall at Battle Creek, on Thursday and Friday, the 8th and 9th of December. The time and place makes it convenient for those who wish to attend the ient for those who wish to attend the annual meeting of the State Hortisummar meeting of the State Horti-eultural Society, which convenes at South Haven, the three previous days of the same week. The Michigan Central, Chicago & Grand Trunk, Detroit, Grand Haven & Milwankee, and the Grand Rapids & Indiana Rail-rouds well sall tightets to monkers et roads will sell tickets to members at excursion rates. To secure reduced fare, all must have certificates, which can be furnished by the President, A.

can be furnished by the President, A. J. Cook, Lansing, Mich. Arrangements are made with hotels for fare at from 80 cts., to \$1 per day.

The meeting promises to be the largest and the best ever held. All bee-keepers are cordially invited to be present. Bee-keepers are requested to bring samples of honey, apparatus, and articles of interest to apiarists. The following programme has been The following programme has been

arranged:

THURSDAY FORENOON.

"Italian bees," S. K. Marsh,
"The new bees," D. A. Jones,
"Shall we continue to import queens?" Discussion opened by A.

#### AFTERNOON.

"Bees and grapes," H. D. Cutting "Mistakes of bee-keepers," Dr. E

B. Southwick.
"Honey as food," Dr. J. H. Kellogg. "The future honey market,"

Newman.

EVENING. "Crumbs from the table of the National Convention," President's ad-

" Adulteration," Dr. J. H. Kellogg. " Apiarian implements," Hon. A. B.

Cheeney.
FRIDAY FORENOON. "Rearing and selling queens," W.

Z. Hutchinson. "Foundation." James Heddon. Address, A. I. Root.

### AFTERNOON.

"Foul brood," C. F. Muth.
"Extracted honey," Chas. Dadant.
"Hints," T. F. Bingham.
Election of ollicers and reports.

### EVENING.

"Wintering," O. O. Poppleton, D. A. Jones, C. F. Muth, and others. Miscellaneous questions. A. J. Cook, Pres.

T. F. BINGHAM, Sec.

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Nov. 30, 1881. N. E. FRANCE, Scc., Platteville, Wis.

# SELECTIONS FROM

Bees in Good Condition. - I now have Dees in toolic condition.—I now have 25 colonies of bees in good condition for winter. The Bee Journal just suits me.

John Ferstel.

Ingletield, Ind., Nav. 12, 1881.

Bees Show Signs of Dysentery.—My bees are now fixed for their winter quarters on the summer stands, but several show signs of dysentery which 1 believe that I cannot account for. I believe that the cause is this: Owing to the drouth of this season and the scarcity of honey producing flowers, the bees kept up a promeing nowers, the nees kept up a continual hum over the broken and mashed melons, which were scattered throughout the country by thousands. This district is becoming famous for muleur-griging and burn forceful it will melou-raising, and I am fearful it will prove disastrons to the bees. prove dististions to the bees. One station alone, near me, shipped 550 cars this season. Why is it that bees consume such a vast amount of water during a scarcity of honey? I have made a note of this on several occasions. I am located near a lake or mande a mocated near a lake or marsh, which is under water the year round. It is filled up with flag, weeds. etc., which do not produce honey. Is there a honey plant or seed that can be sowed in spring or fall, that will germinate and grow in the water? 1 perminate and grow in the water is believe. I have fertilization in a unit-shell. Will test it thoroughly this coming season. J. Smith Head. coming sesson. J SMITH Benton, Mo., Oct. 31, 1881.

[Your surmise regarding the cause of dysentery is undoubtedly correct and we see no way to obviate the dif ficulty, unless you extract closely at the close of the melon season, and give the bees a winter supply of good honey or sugar syrup. It may be that during a scarcity of honey the bees use more water in thinning the feed for larvæ. but we doubt it. On your marshy ground try hydro-piper, known also as marsh-smartweed and blackheart We do know that it will grow in standing water, but along the Illinois, Ohio and Mississippi river bottoms, and other places subject to frequent and protracted floods, it abounds largely. It gives a generous though late supply of beautiful amber honey. Plant it in the fall. If it will not fill the want we know of nothing that will. Why not give the public your method of fertilization, and let them experiment with it too; they might remedy defects you would overlook?-Ep.]

Bereaved.-You will see by the fol lowing notice from one of our county papers, that I have recently passed through a dark cloud of affliction No. I cannot say that I have passed through it, for it hangs like a pall over our home now,

"Mrs. John H. Martin died quite suddenly after a short illness, of heart disease. The funeral services were disease. The funeral services were held in the Baptist church, Monday, Oct. 31. Rev. Mr. Ernst, of the Congregational church, at South Hartford, of which she was a member, of ficiated, assisted by Revs. A. A. Watson and R. Campbell. She was held in high esteem by all who knew her, and her death will be mounted by a large circle of relatives and friends. Her social and amiable qualities have endeared her to her many friends in endeared her to her many friends in this vicinity. She will long be re-membered as a zealons and devoted Christian—a warm and geni d friend, and a loving and faithful wife."

My wife was sick barely 2 weeks, My wife was sick barry 2 weeks, when death relieved her of her sufferings, and the pure Christian possed across the river where all is peace and joy.

J. H. MARTIN.

joy. Hartford, N. Y., Nov. 12, 1881.

The Chicago Convention and Honey Report.—I regret very much my inability to attend the Chicago Bee Convention, in which I purposed to exhibit some of the best of my prize most some of the best of my prize queens and their progeny, but the constant rain and cold, cloudy weather prevented. Is not October with a prevented. Is not October entirely too late in the season for such exhibi-tions? Why not have the next some tions? Why not have the next some time in September of next year? My report for the year 1881 is as follows: Being away from home last fall and winter, my bees were left upon their summer stands, and all died, 35 in number. In April, I purchased one imported colony, and 8 others. From these 9, I have increased to the number of 52 colonies thus fall, all my 35 old hives being refilled with bees, giving them the old combs from last year, and 8 colonies over. I have also year, and 8 colonies over. I have also taken 440 lbs. box honey, and 120 lbs. extracted honey, a total of 560 lbs. This gives an average of 6214 lbs. per colony, for each of the nine that I commenced with. E. L. Buiges.
Wilton Junction, Iowa, Nov. 8, 1881.

Honey Cake.—Having noticed in the Money Cake,—Having noticed in the AMERICAN BEE JOURNAL a request for a recipe for honey cake, I send you the following; the boys pronounce the cake made by it excellent: One pint of flour, I tablespoonful of butter, I tenspoonful of soda. 2 tenspoonfuls of tenspoonful of soda. 2 tenspoonfuls of cream tartar, and honey sufficient to make a thick batter; spread about an inch thick, and bake in a hot oven.

A SUBSCRIBER.
Louisiana, Nov. 15, 1881.

Apiary Record Book.—I endorse Mr. E. A. Thomas' letter in the BEE IOURNAL, to the effect that you ought to get up a small, handy book to keep record of each hive and for use erally. It strikes me as a capital idea. FREDERICK C. BOWDITCH. Boston, Mass., Nov. 14, 1881.

Unexpected Good Luck .- After 78 the most fearful and destructeve drouth ever witnessed by the olderst man now living in this State, I write you a few notes by way of report from this section of the bee world. Thank the Lord! if he does afflict us sometimes, he always blesses us at his sometimes, in always besses as at the own good time. I came through the long, cold and dreary winter with 6 colonies as weak as ever pulled through by mursing, feeding and warming by mursing, feeding and warming Soon as peach and apple bloom came fully ont and spring fairly opened, a most incessant rain set in, that entirely lestroyed the poplar and most of the white clover. Then came the linder bloom which was rich and abundant, but lasted only about 5 days. On the out lasted only about 5 days. On the 29th of June set in the unparalleled brouth of 78 days. During the mouth brouth of 78 days. During the mouth of May I made 4 artificial swarms, inof May I made 4 artificial swarms, in-troduced Italian queens, etc., making my number 10 colonies. They were all full and booming with young bees, should and eggs, when the drouth came in and cut everything off. My buck-wheat just liferally burned up; one wheat just merany burner up, on cre did not produce half a grain of honey. Lexamined a few of my best colonies the last of July and list of August and did not find 5 lbs. of honey in the whole apiary. I shut up the August, and did not must have a fine the whole apiary. I shut up the hives, shook hands with them, saying "Good-bye, 'Liza Jaue!" Yes, right there and then I went into "Blasted Hopes," as A. I. Root would say. But glorious! I found them full up to-day. giornous! I found them full up to-day, I had to put on another story with frames, to give them more room. You never saw bees work stronger in May and June. They lie out and roar all night, just as they do in the flow of ooplar and linden. I inclose a specimen of the wonderful, little, insignificent bloom that has done this wonder. men of the wonderful, little, insignificant bloom that has done this wonderful thing! We call it aster. There is the greatest profusion of it on all the glades and pasture lands. The bees get something from smartweed and goldenrod, but this little plant is a world-beater. Heretofore the bees have not gathered much from it, but this season it is our great stand-byour salvation for the bees. Please give me the name of the flower. I could extract a quantity of honey, but am

fearful from last winter's experience irass and pastures are fine fruit trees are taking a second growth. If frost holds off 20 days our bees will be ready for winter, and be in better condition than we ever had them since J. A. Burrow, I can remember. Santa Fe, Tenn., Oct. 4, 1881.

[The flowers sent are asters. While in attendance at the National Convention, Oct. 5-7, we observed large quantities of asters in bloom through the central portions of the State of Kentucky, and a copious flow of honey was the general report.—Ed.]

The Drouth and Feeding.-I had 10 colonies in the spring, which increased by natural swarming to 23, and gathby natural swarming to 23, and gathered over 300 lbs, of combinency. The season was pretty good for a short time, but we have had such a sever drouth that bees have not done anything the state of the season. thing since the middle of July: I have been feeding inside the hives since the need reeding fisher the fives since the middle of September, and have them in pretty good condition for winter On looking over one of my young col-onies about the middle of August, 1 found it had a fertile worker, and seeing an article in the BEE JOURNAL of and an article in the body of state and Aug. 10, by E. A. Thomas, explaining how to get rid of fertile workers. I tried it and succeeded. They have tried it and succeeded. They have reared themselves a queen from brood I gave them, and are in good condition now, with brood in all stages. he most, or like all, I must say that I

like the BEE JOURNAL very minch.
A. RICKENBACHER.
Gehenna, O., Nov. 14, 1881.

Dividing Colonies Late in the Season. -At some distance from home, lately I was asked by a gentleman to see his bees. On doing so, I found that he had allowed some full colonies to be nad allowed some full colonies to be divided, each half colony being placed on about two frames of their own comb. containing 2 to 3 lbs. of honey and a little broad, with frames of comb foundation to fill the remaining space This was done about the first week in October, on the theory that by feeding the article called diamond drip, the half colonies would build up to proper strength for wintering. I saw these bees about 10 days after they were di-vided, when some had deserted the hives, some had queen cells, and in a few cases as much as one frame of foundation was drawn out, and about thalf filled with sealed brood. Where the fed article was sealed it had the appearance of light comb honey. I advised the gentleman to form colonies. for winter by uniting the fragments that were left, but I did not know what to say about leaving them to depend mainly upon the diamond drip for winter supplies. If you will inform us on this point, and also tell us what you think of dividing as late as Oct 1st, under any circumstances, you wil confer a favor.

J. E. PITMAN. confer a favor. J. E. Pin Marlboro, Va., Nov. 2, 1881.

IIf diamond drip is made from pure cane sugar, bees will winter on it very nicely; if it is a glucose fraud, we would not trust it. We can see noth ing to gain, and everything to lose, by dividing so late. Possibly the portion containing the queen might survive the winter; but we do not think it

probable that the queenless parts can rear queens in time for winter reinforcements. Under no circumstances would we divide later than  $\Lambda$ ugust. Ep.1

Oregon for Bees and Honey .- After a prosperous journey of 17 days, l am here in a mild climate with my am here in a mild climate with hy family, where I expect to try my old profession of keeping hees. I have seen very few in the State, as yet. I have not talked with any bee men yet as I have just arrived. When I look as I have just arrived. When I look fround some, I will say what I think of it as a honey State.

DAVID RICE.

Albany, Oregon, Nov. 7, 1881.

Fertile Worker. - In July I found my old Italian colony queenless, with plenty of bees and honey, but no eggs or larvæ. I obtained a tested Palestine or larvæ. I obtained a tested Palestine queen, and introduced her on the 28th. She commenced laying on the 3d day, and on the 20th of Sept. I found 13 queen cells, all capped, but no eggs, a few large larvæ, thousands of brood ready to hatch, and the old queen gone. I took off all the queen cells, for I had no drones in my apiary. The hive was crammed full of beautiful Palestine bees. Do you think the old queen would have swarmed out and left this late in the season? On the 1st of October I obtained another queen, and when I examined the hive before inroducing her, I found, to my surprise, roducing her, I found, to my surprise, thousands of eggs, with from 1 to 8 in a cell. I searched through 4 times, but failed to find the egg-laver, so I blaced a new hive on the old stand, setting the old hive back about 2 feet. I then smoked them beavily, took the I then smoked them beavily, took the frames and combs out, brushed the bees all off into the old hive, and put he combs and frames into the new bive. I filled the old hive with empty frames, except one comb which had no eggs in it. All this time the bees were swarming back to the new hive on the old stand. I then moved the old hive away some 30 feet, and by lark all the bees had returned to the new hive except about a pint, which were clustered on the comb in the old nive. Next morning I found the comb five. Next morning From the combex4 inches) nearly filled with eggs. I lipped the comb. bees and all in a tub of water, and killed all. On the 3d of October I introduced the queen. She commenced laying the 3d day after, and the bees then cleaned out all the first library leaves and her bread is Fertile worker eggs, and her brood is now about all hatched. She is now retired for the winter.
R. M. Osborn,
Kane, Ill., Nov. 5, 1881.

[It is not probable the old queen swarmed ont so late, and left the hive "crammed full" of bees.—Ed.]

Bees in Good Condition .- The old colonies are in good condition; late swarms, that are not looked after, will swarms, that are not looked after, win lie before spring. I do not think here is within 75 per cent, of the colmies in this county there were four years ago. Lamsold out to 15 colonies in good shape; sold 80.

J. H. Shimer.

Hillsboro, Ill., Nov. 17, 1881.

Tulip Tree Plants.—Please answer the following through the BEE JOURthe following through the BEE JOUR-NAL: How many pounds each of cat-ip, figwort and motherwort are re-pired to sow an acre, when sown together as recommended by W. T. Stewart, in the BEE JOURNAL for Oct. 19? 2. Where can I get the tulip poplar in quantities? We are always inxiously looking for the next number of the Berg Loughal and very highly of the Bee Journal, and very highly orize it; cannot see how any one that keeps bees can afford to be without it.
J. E. Pryor.
Arbor Hill, Iowa, Nov. 11, 1881.

11. If sown broadcoast, one pound ach will be a great abundance; if in Irills, much less. The figwort will be best sown in forcing-beds and transplanted in rows.

2. We do not know. Parties able to fill orders, will probably advertise in time to make arrangements for spring planting.—Ed.]

New subscribers for the Weekly BEE JOURNAL, for 1882, will have all the remaining numbers for 1881 free from the time the money is received it this office. Therefore, the sooner hey subscribe for it, the more they will obtain for the \$2.

It will pay to devote a few hours n getting up a club for the BEE JOURNAL. Read the list of premiums on mother page, and take advantage of the fall gatherings to get up clubs.

### Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbou Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists Langstroth, Dzierzon, and the Baron of Berlepsch.-Price 25 cents each.

 $\hfill \begin{tabular}{ll} \hfill \$ 

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

An Agreeable Dressing for the Hair, that will stop its falling, has been long sought for. Parker's Hair Balsam. sought for. Parker's Hand distinguished for its purity, fully sup-

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them. expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the Journal for a year free. It will pay to devote a few hours to the Berg Lournal. the BEE JOURNAL.

Women are Everywhere Using and recommending Parker's Ginger Tonic, because they have learned from experience that it speedily overcomes despondency, indigestion, pain or weakness in the back and kidneys, and other troubles peculiar to the sex.-Home Journal. See adv. 44w4

It would save us much trouble if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—
Also, if you live near one postoffice and get your mair at another, be sure to give the address we have on our list.

Why suffer such unspeakable tor-tures? Rheumatism has been con-quered. Kendall's Spavin Cure is the quered. Kendall's Spavin C victor. See advertisement.

We have a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

Important to Grocers, Packers, Hucksters, and the General Public. THE-

# King Fortune-Maker, A New Process for Preserving all Perishable Articles, Animal and Vegetable, from Fermentation and Putrefaction, retaining their Odor & Flavor.

"OZONE-Parified air, active state of oxygen."-WEBSTER.

s Preservative is not a liquid, pickle, or any of the old and exploded processes, but is simply and to QONE, as produced and applied by an entirely new process. Ozone is the a tisequite pruche crystalstance, and possesses the power to preserve animal and cycluble stanctures from decay, ery sits nothing on the face of the earth liable to decay or spoil which Ozone, the Erreservative, will not preserve for all time in a perfectly fresh and palatable

There is nothing on the face of the carch Habie to decay or spoil which Ozone, the new Preservative, will not preserve for all time in a perfectly fresh and palatable condition.

The value of Ozone is a natural preserver has been known to our abler chemists for years, but, until now, no means of producing it in a practical, mexpensive and simple manner, lave been discovered. Mero copic observations prove that decay is due to septic marter or minute age and its develop and feed upon animal and vegetable structures. Ozone, applied by the Prentiss method, setzes and destroys these germs at once, and tims preserves. At our offices in Cincinnation in the seen almost every article that can be toought of, preserved by this process, and every visitor is welcome to come in, taste, smell, take awas with min, and test in every way the incritisol tizone as preservative. We will also preserve, free of charge, any article that is brought or sent prepaid to us, and return it to the sender. FRESH MEATS, such as beef, mutton, voil, pork, poultry, xame, dish, &c. preserved by this method, can be shipped, subjected to atmospheric changes, and return to this country in a state of perfect preserving.

FRESH MEATS, such as beef, mutton, voil, pork, poultry, xame, dish, &c. preserved by this method, can be shipped, subjected to atmospheric changes, and return to this country in a state of perfect preserving. The process of the preserved of the preser

s, change in the slightest particular in the appearance of any article thus preserved, and no oreign or unnatural odor or toste. The process is so simple that any child can operate it successfust as a main. There is no expensive apparatus or machinery required with different articles, such as eggs, meat, itsu, etc., can be treated at one time, without

as well and as so cession.

A room lined with different articles, such as eggs, meat, itsu, etc., can be treated at one time, we additional trouble or expense.

16 In fact, there is nothing that Ozone will not preserve. Think of everything you can that is intole to sour, decay or spoil, and toen remember that we guarantee that Ozone will preserve it in exactly the constitution you want it for any length of time. If you will remember this, it will save asking questions as to whether Ozone will preserve tils or that article—it will preserve anything you can think of.

There is not a township in the United States in which a live man cannot make any amount of money, from \$1,000 to \$10,000 a year, that he pieuses. We desire to get a live man interested in cach county in the United States, in whose hands we can place this Preservative, and through him secure the business which every county ought to produce.

# FORTUNE Awaits any Man who Secures Control of OZONE in any Township or County.

Bowen, Marion, Ohio, has cleared \$2,000 in two months; \$2 for a test package was his fir tin-

A. C. Bowen, Marion, Ohio, has cleared \$2,000 in two months; \$2 for a test, package was ins or timewhoods Brothers, Lebanon, Warren County, Ohio, made \$6,000 on eggs purchased in August and sold
in November; \$3 for a test package was their first investment.

F. K. Raymond, morristown, Belmont County, Ohio, is clearing \$2,000 a month. In handling and sellling Ozone; \$3 for a test package was his first investment.

D. F. We deer, Charloite, Eaton County, Mich., has cleared \$1,000 a month since August; \$2 for a test
package was his first investment.

J. B. Gaylord, so has alle street. Chicago, is preserving eggs, fruit, etc., for the commission men of
Chicago, charging 156, per dozen for eggs and other articles in proportion. He is preserving 1,000 eggs
per day, and on his business is making \$3,000 per month clear; \$2 for a test package was his first in
vestment.

per day, and on its cusiness is making \$5,000 per mount clear; \$2 for a test puckage was his first investment.

The Cincinnali Feed Co., 498 West Seventh Street, is making \$5,000 a month in handling brewers, and, preserving and shipping it as fee to all parts of the country. Malt capresserved sours in 24 hours; preserved by Ozone, it ke ps perfectly sweet for mouths.

These are instances which we have asked the privilege of publishing. There are scores of others Write to any of the above parties and get the evidence direct.

Now, to prove the absolute truth of everything we have said in this paper, we propose to place in your hands the means of proving for yourself that we have not calaffined half enough. To any person who doubts any at these statements, and who is interested sufficiently to make the truth, we will pay all traveling and hotel expenses for a visit to this city, if we fail to prove any statement that we now made.

### HOW TO SECURE A FORTUNE with OZONE

A test package of Ozone, containing a sufficient quantity to preserve one thousand dozen e.g.s, or the ratticles in proportion, will be sent to any applicant on receipt of \$2. This package will enable applicant to pursue any line of tests and experiments he desires, and thus satisfy himself as to the traordinary merits of ozone as a Preservative. After having thus satisfied himself, an had time to sk the field over to determine what he wishes to do in the luture—whether to self the niticle to others to confine it to his own use, or any other line of podge which is best suited him and to his town poor county—we will enter into an arrangement with him that will make a fortune I r him and give good profits. We will give exclusive township or county priv leges to the first responsible applicant or orders a test package and desires to control the business in this locality. The man who secures introl of Ozone for any special territory, will enjoy a monopoly which will surely such him.

Out the day pass until you have ordered a Test Package, and if you desire to secure an exclusive vinege, we assure you that delay may deprive you of t.f. ir the applications come in to us by scores ery mall—many by telegraph.

For a time of secure of the expense of charges for return of money. Our correspondence is very large; we have all can do to a stend to the shipping of orders and giving attention to our working gents. Therefore, cannot give any attention to letters which do not order uzone. If you think of any article that you of out the Assurage of the preserving, remember we goarantee that it will preserve it, an matter hat I is.

what it is.

REFERENCES—We desire to call your attention to a class or references which no enterprise or firm based on anything but the soundest business and highest commercial merit could secure.

We refer, by permission, as to our integrity and to the value of the Prentiss Preservative, to the following gentlemen: Edward C. Boyce, Member Board of Public Works: E. O. Eshelby, City Comproller; Amos So th, Jr., Collector Internal Revenue; Wuisin and Worthington, Attorneys; Martin H. Harrell and B. F. Hopkins, County Commissioners; W. H. Cappeller, County Auditor, all of Cincinnath, Hamilton County, Ohio. These gentle are each familiar with the merits of our Preservative, and know from actual observation that we have without question

### The Most Valuable Article in the World!

The \$2 you invest in a test package will surely lead you to seeure a township or county, and then your ay is absolutely clear to make from \$2,000 to \$10,000 a year.

Give your full address in every letter, and send your letter to

# The Bee-Keeper's Guide;

### MANUAL OF THE APIARY,

By A. J. COOK, Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 fine Illustrations.

---:0: ---This is a new edition of Prof. Cook's Manual o the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months — a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and per-sistent research. It comprises a full definention of the anatomy and physiology of the honey bee, Illustrated with many costly wood engravings— the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shruhs, etc., splendidly illustrated and last, though not least, detailed instructions for the various manipulations necessary in the aplary.

manipulations necessary in the aparty.

This work is a musterly production, and one that
no bee-keeper, however fluided his means, can
afford to do without. It is fully "up with the times"
on every conceivable subject that can interest the
aplarist. It is not only instructive, but intensely
subject that any discount is a subject to the form of the subject to the s interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value. -L Apiculture, Paris.

Tthink Coo is Manual is the best of our American works. - Lewis T. Col.By.

can works,—LEW is T. COLW.

It appears to he cent the ground from under future hook unders.—Brite h Rec Journal.

Prof. Cook's valuable Manual has been my consent gaide in my operations and successful management of the aphry.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who outsins it, will ever regret having purchased.—Mich. For.

Is a masterly articultion and one that no bees.

It, will ever regret having purchased.—Mich. Für.

Is a masterly production, and one that no beekeeper, however limited his means, can afford to
do without.—Ni-braska Furner.

To all who wish to engage in bee culture, a
manual is a necessity.—Prof. Cook's Manual is no
exhaustive work.—Herald, Monticello, Ill.

With Cook's Manual I am more than pleased. It
is fully up with the times in every particular. The
richest reward awaits its author.—A. E. WENZEL.

My success has been so kreat as to almost aston-ish myself, and nuch of it is due to the clear, dis-interested information contained in Cook's Mac-ail.—WM VAN ANTWERP, M. D. It is the latest book on the bee, and treats of both the bee and nives, with their implements. It is of value to all bee-raisers.—Ky, Live Stock Record.

value to all bee-raisers. - Ky, Live Stock Record.
It is a credit to the author as well the publisher.
I have never yet met with a work, either French
or forein, which I like so much.—L'Alaise DU
Buts, editor of the Bulletin D'Apiculteur, France.
It not only gives the matural history of these indinatrious insects, but also a thorough, practical,
and clearly expressed series of directions for their
minagement; also a botanical description of honey
producing plants, and an extended account of the
enemies of bees.—Democrat, Pulnski, N. Y.

We have perused with great pleasure this vade mecan of the bee-keeper. It is replete with the best information in everything belonging to app-culture. To all taking an intere t in this subject, we say, obtain this vabuable work, rend it carefully and practice as advised.—Agriculturis!, Quebec.

best information on everything belonding to apticulture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised. \*Agriculturist, Quebec.\*
This book is pronounced by the press and leading bee-men to be the most compute and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welc me and it is essential to every numbeur in bee-culture. It is handsomely printed, neatly bound and is a credit to the West. \*Wistern Agriculturist.\*
This work is undoubtedly the most on op'eto manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left unto-ched, and in the compilation of the work Prof. Cook has bad the advantage of all the previous knowlede of a pairists which he uses admirably to promote and make propular this most interesting of allocationaphons. \*American Inventor\* It may safely be pronounced the most complete and comprehensive of the several manages which have recently appeared on the subject of bees and their handing in apairies. The studies of the structure of the bee, the different varieties, the various bee products, and tolowing those the points of management, extending to the smallest denils, are all of high and practical value. Prof. Cook has presented the latest phases of progressive bee-keeping, and writes of the themes discussed in the light of his own experience. \*Pacific Rural.\*

Of the many excellent works which we have examined on bee-culture, we consider Prof. Cook's the most valuable for the study of those who contemplate going into the business or are already keeping bees. If thoroughly studied, and its teachings conformed to, by the apartist, who exercises a reasonable degree of common sence, be or she cannot fail to achieve at least a reasonable degree of senting sense humself to the work with a decree of co

### THE KANSAS BEE-KEEPER,

Published Monthly at Columbus, Kan., A new sixteen-column bee paper, devoted entirely to the test interests of boney producers; dealers in Supplies and breeders of Queens and Bees Will be sent to any address one year torouly thirty cents. We club with the Weekly American Bee Journal for only \$2.15. Sample copies free. Address, SCOVELL & ANDERSON, 28wtf Columbus, Kansas.

### FARMERS' HOME JOURNAL,

FARMERS HOME JOURNAL,
A weekly paper devoted to Agriculture,
and kindred subjects. The Farmers' Home
Journal represents the large class of fine stock
breeders in the Ono Valley, and the great tobacco
sections of Kentucky, indiana and Teamessee;
also, is the Organ of the Kentucky Hortcultural
Society and of the Kentucky State Bee-Keepers'
Association. It is an old-established farm and trestate paper, and popular among its subscribers.
Terms of subscription, \$1.50 per voir. Send for
sample copy. Address, Farmers' Home Journat, Lonisville, Ky.

### PARKER'S GINGER TONIC

ABBONIA, MICH.

Ginger, Buchu, Mandrake, Stillingia, and many of the best medicines known are combined in Parker's Ginger Tonic, into a medicine of such varied powers, as to make it the greatest Blood Purifier and the Best Health & St reutch Restort Ever Used. It cures Rheumatism, Sleeplessness, & diseases of the Stomach, Bowels, Lungs Liver & Kidneys.

Parker's Hair Balsam.

# ITALIAN BEES Books for Bee-Keepers.

Sent by muil, postpaid, on receipt of price, by THOMAS C. NEWMAN. 974 West Madison Street, CHICAGO, ILL,

Rec-Keeper's Unide; or, Cook's Minutal of the Aphrey. Entirely re-written, elegantly illustrated and tally 'up with the times' one every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can aford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Ree-Keeping, by L. G. Root-The anthor treats the subject of bee-keeping so that it cannot (ai) to interest all. Its style is plain and forcible, making all its renders realize that its author is master of the subject.—\$1.50. Novlee's ABC of Bee-Culture, by A. I. Root —This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25; paper, \$1.

hose more-advanced. Clotto, \$1.25; paper, \$1. King's Ree-Kecpers' Text-Hook, by A. J. King.—This edition is revised and brought down to be present time. Clotto, \$1.00; paper, 75e. Langstroth on the Hive and Honey Hee This is a standard scientific work. Price, \$2. Hiesaed Rees, by John Allen.—A romance of see-keeping, till of practical information and on tactous enthusiasm. Clotto, \$1.00.

Briessed Rees, by Jinn Allen.—A full and contagious enthusiasm. Cloth, \$1.00.

Wees and Boney; or, successful management of the Aphrey, by Thomas G. Newman.—This embraces the following subjects: Location of the Aphrey Honey Flants—Queen Rearing—Feeding —Swatmans—Dividing—Transferring—Quieting and Handling Bees—Marketing Linux, etc. It is published in English and German.—Price for either edition, \$40 cents, postpaid.

Bzierzon Theory:—presents the fundamental principles of beesculture, and furnishes the facts and arguments to demonstrate them. 15 c.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, in the nature, and Honey classes, thousand, a furnishes for the Honey Cakes, Chookes, Puddings, Fonn, Wines, etc. and Honey as Medicine with many useful Recipes, It is intended for consumers, and should be scattered by thomsands, creating a demand for honey everywhere. Published in English and German.—Price for either edition, \$6c; per dozen, \$50c.

Wintering Bees.—This contains the Prize Essiys on this subject, read before the Centennial Bee-Keepers' Association. The Prize—\$25 in gold—wisawarded to Prof Cook's Essay, which is here given in till. Price, \$10c.

The Hive I I se—Being a description of the hivr is sed by G. M. Doolittle, Price, \$5c.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

contains many useful hints.—Price 15c.

Practical Hahrs to Rec-Recepers, by Chas,
F. Muth; 32 pages.—It gives Mr. Muth's views on
the management of bees, Price, 10c.

Food Adulteration; What we eat and should
not eat.—This book should be in every family, and
ought to create a sentiment against adulteration of
food products, and demand a law to protect the
consumer against he numerous health-destroying
adulterations offered as food.—200 pages—50c.

adulterations offered as food. 200 pages 50c.

Kendall's Horse Hook. — No book could be more useful to horse owners. It has 37engravings illustrating positions of sick hoses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Ropp's Ensy Calculator.—These are handy tables for all kinds of userchandse and interest, it is really a lightfulng calculator, well bound, with shite and pocket. Cloth, \$1.1 Morceo, \$1.50.

Chicken Cholera, by A.J. Hill.—A treatise on its cause, symptoms and cure. Price, 25c.

It is really a lightning calculator, well bound, with shate and poeket. Cloth, \$1.1, Morocco, \$1.50.
Chicken Cholera, by A. J. Hill,—A freatise on its cause, symptoms and cire. Price, 25c.
Moore's Universal Assistant, and Complete Mechanic, contains over 1,00,000 Industrial facts. Calculations, Processes, Trade Secrets, Legal Rems, Basiness Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Clvid and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Mine, a, Metallingists, Assayers, Pambers, Gas and steam Fitters, Bronzers, Gilders, Metal and Wood Workers of every kind,
Builders, Mannfacturers and Mechanics. 500 Engineers, Metal work, Mechanical Movements, Plans of Mills, Roots, Bridecs, etc. Arrangement and Speed of Wheels, Pulleys, Drums, Bells, Saws, France, Mills, Roots, Bridecs, etc. Arrangement and Speed of Wheels, Pulleys, Drums, Bells, Saws, France, Mills, Roots, Bridecs, etc. Arrangement, and Speed of Wheels, Pulleys, Drums, Bells, Saws, France, Mills, Roots, Briders, etc., Springer, Mills, Roots, Briders, etc., Springer, Mills, Roots, Briders, Briders, Mills, Roots, Briders, Briders, Mills, Roots, Presses, etc., Strength of Teeth, Shafting, Briding, Etching, Belting, Etching, Presses, etc., Strength of Teeth, Shafting, Finishing, Engine Building, Repairing and Operating, Settling of Vulves, Eccentries, Link and Vulve Motion, Steam Packing, Pipe and Boller Covering, Scale Preventives, Steam Hearling, Ventilation, Gas and Water Works, Hydraulies Mill Dans, Horse Power of Streams, etc., On Blast Furnaces, Iron and Steel Manufacture. ### CHICAGO, ILL., NOVEMBER 30, 1881.

No. 48.

Published every Wednesday, by

### THOMAS G. NEWMAN EDITOR AND PROPRIETOR,

974 WEST MADISON ST., CHICAGO, ILL.

TERMS OF SUBSCRIPTION:

WEEKLY-(52 numbers) \$2 a year, in advance.
Three or Six Mouths at the same rate.

SEMI-MONTHLY—The first and third numbers of each mouth, at \$1.00 a year, in advance.

MONTHLY-The first number of each month, at 50 cents a year, in advance.

Auy person sending a ciub of six is eutitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

Remit by money-order, registered letter, ex-press or bank draft on Chicago or New York, pay-able to our order. Such only are at our risk. Checks on local banks cost us 25 cents for collecting.

Free of postage in the United States or Canada. Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

### American-Italian Bees in Japan.

Mr. R. Mayerhoeffer, Taschivitz, Austria, sends us the following translation of a letter received by him from Japan:

Since 1877 the Italian bees are imported to this country from America, and manipulated in a hive of American style. The characteristics of these bees are: more vigorous, larger in size, bees are: more vigorous, larger in size, and the amount of honey gathered is much greater than from our native bees. Their culture is spreading year after year to every district in Japan adapted to bee-culture. I am sorry to say that the Italian bees are often deverged by the chimney swallows until voured by the chimney swallows while on their flight. I think this is caused by their large size.

This country has furnished Italian bees for Japan, New Zealand and Australia, and it only awaits our perfection of the "coming bee," to exchange queens, bees and compliments with our Italian friends. Last spring we were consulted by a Swedish gentleman in the selection of a sample hive, sections, foundation, etc., for introduction into Sweden, and but a little time will elapse ere our bees and apiarian implements will be familiar objects throughout all Christendom.

The United States have shipped and Japan, where it has found a ready market at fair prices, and been a popnlar article of consumption with the have more bees than you wish to keep, next week.

better classes. Properly developed, the Celestial Empire will furnish a market for every pound of honey that can be produced on our Pacific coast. nor will the introduction of American-Italian bees into China and Japan injure the traffic, but will, rather, have a tendency to stimulate it.

### Extravagant Economy.

The above reflection was suggested to us not long since, when we saw a large lot of beautiful honey put up in all sorts of odds and ends, intended to represent sections. The apiarist evidently had these sections on hand, or bought them at half-price, and in a spirit of wasteful frugality determined to use them rather than pay a fair price for a neat, attractive section. He undoubtedly lost enough time in assorting and arranging them to have paid for a good article. His economy cost him just four cents per pound on bis honey.

It is extravagant economy to delay ordering hives, sections, foundation, etc., till the last moment, or till they are needed for use, for frequently a dealer finds it impossible to fill all orders promptly when they are held back till the last moment, and then accompanied with the parenthetical request, Send at once, I want it bad." By ordering in a dull time, better figures can generally be obtained, more satisfactory work will be performed, and you can take advantage of your odd time to prepare them for use, and to remedy defects, if any exist. Very frequently a few days delay occasioned by this questionable economy will result in a light honey harvest, or the loss of a few swarms of bees.

It is extravagant economy to delay providing pasturage for your bees till a season of dearth comes on, or until you are painfully persuaded your locality is over-stocked with bees. By taking time by the forelock, nature will assist you in extending your pasturage when most needed in the future. and will furnish the seeds for doing so free of charge.

It is frequently extravagant economy to buy the lower priced articles, simply because they are sold for less money. The cheapest in price are often most expensive in experience.

If you expect to be a solicitor of public patronage of any kind, it is extravmany tons of extracted honey to China agant economy to practice a "maspublic to discover your merits. If you | We will give particulars and prices

let the world know it through a liberal advertisement. If you have a really meritorious hive you wish to supply to bee-keepers, "push it;" advertise the hive and its merits. If you are a manufacturer or dealer in supplies, let those who read papers devoted to your specialty know it. If you expect to rear queens and bees for the market, provide yourself with good stock and place yourself prominently before the public as ready to accept its favors. and return an honest equivalent therefor. Do not boast of more than you expect to do, but certainly tell all you can perform. It is extravagant economy to wait for the busy season before you begin advertising, for your business will never be brisk till you are known. Again, during a dull season readers have more time to ponder overyour advertisement, to correspond | honey that can be produced, for cash. with you, and to form an estimate of your business integrity.

During the past autumn we have circulated fifty thousand copies of a Special Edition of the BEE JOURNAL, at fairs, conventions, etc., among those who have heretofore read no paper devoted to bees and honey production in the new and improved methods. We are now daily receiving clubs of subscriptions from these persons, and have been for months past. These will all have to be supplied with bees, queens, hives, sectional boxes, comb foundation and all the necessary appliances for the apiary, during the next few months, and most of them know nothing of dealers in these articles, except what they will glean from our columns in future. Here is an inviting field for supply dealers to oecupy, if they advertise early.

TO the ground that she married a foreigner, in violation of the will of the Duchess of St. Albans, Baroness Burdett-Coutts-Bartlett, President of the British Bee-Keepers' Society, has been compelled to surrender her halfinterest in the banking-house. This takes from her income about \$700,000.

The editor of the BEE JOURNAL expects to attend the Michigan State Convention at Battle Creek, Mich., on Dec. 8, 1881. From present indications it will be an interesting meeting.

We have received sufficient encouragement to now definetely promise to get up the apiary record book terly inactivity" and wait for the that has been so generally called for.

### Selling Honey for Cash.

As another evidence of honey being a staple article, Mr. House, on page 380 of this BEE JOURNAL says:

"We have had the pleasure of see-We have had the pleasure of seeing men traveling the country buying tor cash. This, no doubt, is owing to the earnest work and diligent effort on the part of the heavier producers in this State to concentrate our honey, and we are now reaping our reward."

We do not quite agree with Mr. House in some details of his article, but on the whole it is a valuable and timely production.

Yes; "earnest work" will be rewarded, in every direction while we are endeavoring to make honey astaple article. It is only a question of time when traveling men will be securing the country, buying all the Our faith in the future of honey as a staple article, like butter, cheese and eggs, is strong and invincible. To this we have devoted our time, energies and means, and we are fully aware that all our "earnest work," as well as that of our co-laborers, will be rewarded. Let us all be wide awake —for "the day of prosperity" for our chosen avocation is just dawning.

Melting Combs into Wax,-Mr. Jos. Sayler, Fairmont, Neb., writes: "Will you please to give the best method of making old comb into wax, where parties have no extractor ?"

Warm your combs slightly, so as to press into solid, compact balls, fill a coarse sack with these balls, put all in a boiler, and nearly fill with water, first having put strips of wood in the bottom of the boiler to prevent burning; place heavy weights on the bag to keep it down and press out the wax fast as melted, which will rise to the top, and must be skimmed off and put into a vessel for eaking. If there is much sedument in the wax, it can be melted again without water, when the dirt will settle at the bottom. Many use about a tablespoonful of sal soda to five gallons of water in melting the comb.

We are sometimes asked who our authorized agents are? Every subscriber is such an agent; we have no others, and greatly desire that each one would at least send in one new subscriber with his own renewal for 1882. The next few weeks are the time to do this. We hope every subscriber will do his or her best to double our list for 1882.

#### MISCELLANEOUS.

The Effect of Bee and Honey Shows. -A correspondent in the London Horticultural Journal, says:

I can state without fear of contradiction that never in the memory of man has there been such a desire to man has there been such a desire to keep bees as at the present time. In this district people have been so en-couraged in bee-keeping as taught through the tents, that the agents in the north of Ireland have had to repeat their orders again and again for peat their orders again and again bar-frame appliances, as Messrs. G. Neighbour & Sons could testify. Further, new manufacturers have started in all parts of the country; and besides all this, I have almost daily applications for instructions concerning the bar-frame hive. As regards sectional supers, nothing could be more taking supers, nothing count be more taking than they are, and those who exhibit them at shows are pressed all day to dispose of them, while on the other hand, few "spear the price" of a glass super 21 lbs. at 2s. per lb., or a big, straw skep filled with honey, brood, brookpead etc. bee-bread, etc.

Honey at the Arkansas State Fair. The Little Rock Democrat gives the following list of premiums awarded for honey at the State Fair:

Best package comb honey in the be marketable shape, 5 lbs. or more, W. Hipolite, Duval's Bluff, \$5.

w. Hiponte, Puwai s Biuli, \$5.
Best package extracted honey in the best marketable shape, 5 lbs. or more, Stacy Pettit, Fort Smith, \$5.
Best crate of honey in comb, 25 lbs.,

W. W. Hipolite, Duval's Bluff, \$20.
Best colony of bees, movable comb
hives, F. J. Young, Little Rock, \$10.
Best 5 lbs. beeswax, Mrs. E. H.
Chamberlain, Little Rock, \$2.
Post prophing for extracting honey

Best machine for extracting honey,

Stacey Pettit, Fort Smith, \$2. Best bee hive, W. W. Hipolite, Duval's Bluff, diploma.

Bee-Culture as a Business.—Mr. G. W. Demaree, gives his views on this subject in the Farmers' Home Journal. as follows:

Bee-culture is yet in its infancy. It is only about 20 years ago the Rev. L. L. Langstroth, by his invention of the movable frame live, laid the foundation of scientific bee-culture, and soon after Mr. Wagner commenced the publication of the American Bee Journal, the first paper devoted exclusively to bee-culture ever published in this country. With this state of things, this country. With this state of things, one would suppose that the business would have moved right along, but not so. People had been educated to look on bee-culture as a "little business," and called it "fussing with bees," till ignorance and superstition had taken too deep a hold to be rooted out so easily. The paper was so poorly supported at the start, that the enterout so easily. The paper was so poorly supported at the start, that the enterprise was abandoned for a time, but was revived about the year 1865 or 1866, and after the death of Mr. Wag-1866, and after the death of Mr. Wagner (than whom no man was more highly esfeeded among the bee fraternity), the paper fell into the hands of Thomas G. Newman, whose learning and enterprise soon made it a great success. This paper is now issued weekly, and is as ably and accurately edited as a majority of the best papers in the country. There are now 8 or 10 papers published in the interest of bee-culture, while nearly all the agricultural papers begin to realize that the people want information on this subject. And doubtless this class of papers hereafter will give a due part of their space to the subject of bee-culture, and thereby many persons will be reached who never see a bee paper. paper.

In an age like the present, when universal peace prevails, and men are multiplying rapidly on the earth, new occupations, new methods of earning an honest living must necessarily be encouraged. Millions of pounds of precious nectar secreted by the honey producing flora, goes to waste every year for the want of the busy workers to collect it and prepare it for the use of man, and for the want of skillful apiarists to control and direct the busy workers. Let no man say he can find nothing to do to get a living.

How Cyprian Bees Behave in England.—The editor of the British Bee Journal anoted some American complaints about the ferocity of Cyprians. and adds:

The last extract coincides exactly with our experience, and we can go even further. On several occasions bees that have crept between the folds of our clothing (which they are very prone to do), have, when liberated at night, attacked us by gas-light, when other bees would have been only too glad to escape if it were possible to

Care of Surplus Honey .- Prof. A. J. Cook in the New York Tribune, writes as follows on this important subject:

Last evening, Mr. Samuel Hilbert came to me and dolefully asked: "What shall I do with my honey? It has all soured." "You, an old beekeeper, mean to say that you have put your honey in a cellar or other damp, cool place? Didn't you know better?" "Yes, but when I took off my beautiful white I make honey. I was betiven. ful white June honey, I was driven with work, and so harried it into the nearest place, which happened to be the cellar." This incident furnishes a text for an opportune article on the a text for an opportune article on the care and management of surplus honey. The wise bee-keeper will remove his comb honey just as fast as the bees cap it over. Let it form the highway of travel for the bees but for a few days, and its beauty is gone. Take it off as soon as it is capped and it will regard the capped and it will rival the snow in whiteness, and must tempt irresistibly the buyer. and must tempt irresistibly the buyer. Secondly, put the honey in a dry, warm room. It the temperature is even 100-F, it will be all the better. In such a room the honey will not gather moisture, or "sweat," as it is called, and there will be no trouble from souring. In winter, the warmth keeps the comb from becoming brittle, and may be more safely handled. e, and may be more safely handled. Extracted honey should not only be

kept in a dry, warm room, but in open vessels covered with cotton cloth, so the moisture, in case it was extracted before it was thoroughly cured, would escape. If this precaution is surely heeded, there is little (my experience says no) danger in extracting before the honey is capped over, beginning just as the capping is commenced. This saves no little time and labor. If extracted honey is kept in a temperature of from 80 to 100 F. it will not granulate. Granulation, however, does not injure the honey; in fact, it is one of the best tests of its purity. To reliquefy candied honey, we have only to heat it. If we are careful not to raise the temperature above 180° F. raise the temperature above 180° E., it will lose none of its excellence. To do this easily, place the crock or can containing the honey in a vessel of water, placing something on the bottom of the vessel so that the crock may not touch the bottom and become too much heated. Now if the water in the vessel is not permitted to boil, there is little danger of the honey boil, there is little danger of the honey being injured.

Care should be taken that the bee-

moth does not injure the comb honey after it is removed from the hive. If eggs are on the comb, they will hatch and possibly ruin the honey. Their work is detected in the little particles of wax seen on the face of the comb. The safe way is to place all the comb, one week after its removal from the hive, when all the eggs will be for their labor in getting up the club.

hatched, in a close box or in bottomhatched, in a close box or in bottom-less hives, placed one above the other, then to a smoker in full blast add a tablespoonful of sulphur, and place the funning smoker in the top of the box or in the upper hive; as the sul-phurous fumes are heavier than the air, they will roll to the bottom and suffocate the worms. This is cheaply done and may save much loss and disdone and may save much loss and disappointment.

Let the honey be thoroughly graded as it is put on the market; let it be in clean crates, so made that every pass-er-by shall be enticed, as he sees through a glass not darkly, the tempting honey; let there be no possible chance for the honey to leak, and dischance for the honey to leak, and dis-gust the dealer, and always see that every grocery-man in the vicinity has a supply of this most beautiful and wholesome article of food constantly on hand. The best way to manage sour honey is to heat it till it boils. which kills the plant-germs which cause the fermentation; then feed it back to the bees. In the process of restoring the honey seems to have regained its previous excellence.

### Mitchell's Suit Dismissed.

The Indiana Farmer gives the following information concerning the suit which N. C. Mitchell instituted against it, placing the damages at \$5,000, and which is now dismissed:

In March, 1880, a correspondent wrote us in reference to a certain hive on which a patent was claimed by the above party, or his agents, and the threatened prosecution for the use of division boards. We answered that the hive being offered was not the original one on which a patent had been granted, and that any one found advocating the same would bear watch one found adwas public property and could be used by any one; that the party alluded to had been exposed frequently through the various bee journals, hence the suit. We asked for evidence of any crooked dealings on the part of these parties, and the amount of evidence which has been sent us freely confirms our statement. We wish to return thanks to our many friends all over the land for their kindness in furnishing the preponderance of evidence. We do not wish to make war on any one, but we believe it our duty to protect our readers as far as possi-ble from all kinds of swindling schemes, and we propose to do it so far as is in our power, let the cost be

what it may.

The patent bee-hive business has been a curse to the bee-keeping interest all over the land, and since the movable frame is now public property we strive to convince all beginners that they do not need any kind of a that they do not need any kind of a patent hive. Most of them are very complicated, and have many useless appendages, defeating the very object for which they were intended. They look very attractive and work nicely at a fair, but with a colony of bees in them, all their movable and adjustable parts become glued firmly together with propolis, and to loosen them jars them and makes the bees hard to control. Beginners, especially, should trol. Beginners, especially, should adopt some simple form of a movable frame hive, and use them until they become familiar with the nature of the bees, and they will soon learn that the less complicated the hive the more satisfactory the results will be.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2,-a copy of "Bees and Honey."

" 3,-an Emerson Binder for 1882,
" 4,-Cook's (Bee) Manual, paper.

Or they may deduct 10 per cent in cash

6.-Weekly Bee Journal for I year.

### A Religious Newspaper.

We desire to call the atlention of our readers to one of the greatest newspapers of the age—one that sethe best writers in this country and Europe, regardless of expense; has the best and fullest book reviews nas the best and fullest book reviews of any paper in the country; has able articles upon financial subjects; has departments edited by specialists and devoted to fine arts, music, science, religious intelligence, missions, school and college, news of the week, hymn notes, the Sunday-school, legal and sanitary questions, Biblical research (something that cannot be found in any other newspaper in the United (something that cannot be found in any other newspaper in the United States), farm and garden, insurance, weekly market reports, etc., in fact, a newspaper fully suited to the requirements of every family, containing a fund of information which cannot be had in any other shape, and having a wide circulation all over the country and in Europe. We refer to The Independent, of New York. "The largest, the ablest, the best." See advertisement in another column, and send a bostal card for a free specimen copy. postal card for a free specimen copy.

New subscribers for the Weekly BEE JOURNAL, for 1882, will have all the remaining numbers for 1881 free the remaining mumbers for 1881 free from the time the money is received at this office. Therefore, the sooner they subscribe for it, the more they will obtain for the \$2.

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, Monday, 10 n. m., Nov. 28, 1881.

The following are the latest quotations for honey and beeswax received up to this hour:

#### CHICAGO.

HONEY-The market is lively and prices steady. We quote light comb honey, in single comb boxes, 18@22c; in larger boxes 2c. less. Extracted

BEESWAX - Prime quality, 18@22c. Al. H. Newman, 972 W. Madison St.

### NEW YORK.

HONEY—The supply is full, and trade is lively. We quote as tollows: White comb, in small boxes, 18e 22e; dark, in small boxes, 16e,17c. Exracted, white, 10e,11c; dark, 7ae,1c.
BEESWAX.—Prime quality, 21#26236.
Thorn & Co., 11 and 13 Devoe avenue.

### CINCINNATI.

HONEY—Is in good demand here now. 1 quote: Good comb honey, in sections, is worth 1842/20c, on arrival. Extracted, feete, on arrival. BEESWAX.—1842/20c, on arrival. I have paid 20c, per lb. for choice lots. C. F. MOTH.

### BOSTON.

HONEY.—I-pound combs are a desirable package in our market, and a large quantity could be sold at 239-22c, according to quality.

BEESWAN—Prime quality, 25c.
CROCKER & BLAKE, 57 Clatham Street.

### BALTIMORE.

HONEY.—But little on the market, and prices are not quoted.
BEESWAX.—Southern, pare, 216-23c.; Western, pare, 216-23c.; grease wax, 11c.—Baltimore Market formatic.

### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb, sections, 22@25c.— Indianapolis Stock Review.

### PHILADELPHIA.

HONEY.-The supply and demand are allke nommal. BEESWAX — Best light 23@25c.—Philadelphia Merchants' Guide.

### ST. LOUIS.

HONEY.—Steady, with sale for all offered at quotations; comb at 186022c.; strained and ex-tracted, 86,125c.—top rates for choice put up in small packages suitable for retailing, BEESWAX—Selling lightly at 19629c. R. C. GREERA CO., 117 N. Main Street.

### SAN FRANCISCO.

HONEY—Supply of comb is light, but equal to requirements at present asking rates. The market is not glutted with extracted, but holders find buyers extremely scarce who are willing to pay the prices asked.

Processive white comb. 10620c; dark to good, 10@ processive white comb. 10620c; dark to good, 10@ 14c Extracted, choice to extra white, 83610c; dark and candied, 76.8c. BEESWAX—256.25c.
STEAMNS & SMITH, 423 Front Street.

### CLEVELAND.

HONEY—We report the market quite active; all our sales this week of comb honey in J pound sections have been made at 22c, and two pound sections at 23c. Extracted has taken a start, and we report trade quite active in small packages. 30-pound tin cans, especially, at 12c. per lb. Extracted in bbis, continues dull BEESWAX—200622c.

#### Imported Krainer Bees.

J. M. SHUCK.

I have just received from Herrn, Michael Ambrozie, Legenfeld, Krain, Austria, a full colony of Krainer bees. These bees are to me great beauties, being nearly black with white stripes. the white probably due to hairs, as they all seem to be young bees. They arrived yesterday after a voyage of 26 days, and although the combs were smashed, the bees were lively and only a few dead. I am not certain that the qeeen is alive, but she probably is, as she enstomarily survives the colony through almost any number of mis-

through almost any number of mishaps.

The hive to me is a curiosity, being made of tough, hard, rough boards, about 24 inches long inside, 14 inches wide, and 5 inches deep; top and bottom nailed with odd-looking handmade nails, wooden pegs and wire nails; no frames inside; combs had been built diagonally, and were tilled with dark-colored, thick, rich honey, about 20 pounds. It was quite a task to open this hive, but 1 did it, and found the Krainers lively, good natured, and so fond of honey that they all soon had their fill.

Their flight seems to be very strong,

Their flight seems to be very strong, Their flight seems to mean and I am inclined to think their large as compared with the Italians. It seemed odd enough to see these mounseemed out enough to see these monitain bees flying very freely to-day, with the mercury at 45°, when not a wing was to be seen about my other hives. I have no Krainer bees for nives. I have no Kramer nees for sale, and if I succeed in keeping them till spring, will rear no drones from this queen next year.

Des Moines, Iowa, Nov. 22, 1881.

### Bee-Bread Injurious in Wintering.

JAMES HEDDON.

As I have the near future laid out for much hard work of this kind, I will hasten to reply to the article of the Rev. Mr. Clarke, on page 364 of the BEE JOURNAL for Nov. 16. I am glad he has attacked my theory, and if proves to me that bee-bread is not the main cause of our greatest drawback, I shall have occasion to thank him again and again.

again and again.

It is true I stand 10 to I in favor of the pollen theory; but as long as the I remains the "gness" also remains. It may be possible that I "waxed too confident," enthusiastic and warm upon the milest the said of the confident," enthusiastic and warm upon the subject, but, after all, such a weakness is, to say the worst, a moral one, and to be too full of earnestness hypocrisy and deception is not so very bad, is it? With a possession of it and enthusiasm to leave any room for bad, is it? With a possession of the first named propensities, and the absence of the last, we will get at the truth by-and-by.

unaccountable phenomenon? of the total destruction of a whole apiary over there, and the success of this one over here, proves conclusively that the causes of the effects above named are entirely different, and it is an error to look for them in the realm cold, or confinement, or any other of cold, or commentent, or any other condition that is common with both places. I believe that the pollen theory solves the problem because, first, a few miles intervening changes the

amount, quality and position of bee-bread in the hives.

Second. Close observation of the pollen condition of the remaining hives and dead bees, argues that pol-len-eating is the cause of dysentery. My knowledge of chemistry and the chemical properties of pollen are too limited to allow me to prove that this wintering problem, men substance cannot be eaten in large experience are ready to take t quantities during conlinement with-

out sickening the bees, but other evidences cause me to "guess" that such is the fact. I see no knowledge betrayed in Mr. Clarke's able essay that convinces me that he has any evidence to the contrary.

I have long supposed that bees did discharge small dry pellets when win-tering successfully, but I simply shut that phenomenon out of the considerthat phenomenon of the consideration, because I can see no bearing that it has upon the subject. In nearly all of our most successful cases of wintering, our bees void a liquid feces, wintering, our bees void a liquid teets, and we hardly stop to consider this "dry" technicality; had I said "no liquid excrement," the argument would have remained the same, with the chance to quibble a little left out.

If "two-thirds of the food eaten by the property of the property

man passes from the system through sensible or insensible perspiration, we have every reason to believe that it does from the bee in a much greater proportion. At all events, we have seen the need of upward ventilation and cushions to take care of the excess of the first named matter.

There is no proof, either way, in reard to what Mr. Root's bees did or gard to what did not eat, so why mention the matter

at all?
True, an ox-chain is no stronger than its weakest link, but this rule has no bearing upon a collection of proofs, for teachers of logic have said: teachers of logic have said: "Aever back up a strong argument with a weak one; the diplomatic and cun-ning will attack this weak point, ut-terly ignoring the strong ones that may amply prove your position, and thus defeat you in the minds of your hear-I quote the above, not as having any bearing direct upon the wintering of bees, but to show that so able a logician as Mr. Clarke can possess the weakness of error, or the unfairness to wish to put my arguments in a false

But I will try to show that the weak point is not there. I said that the dead colonies either left plenty of beebread showing signs of late work with it, or brood in all stages, and generally both, but nearly always brood. Mr. Clarke quotes this "nearly always," as though the exceptional cases had a bearing against my argument. My theory is that the consumption of pollen causes the dysentery, and my ob-servation was that *all* dead colonies servation was that all dead colonies showed signs of using it one way or the other, either in connection with brooding or without, but "nearly always" in connection with brooding. Mr. Clarke will stick fast if he tries to get through any hole in that part of the part of my argument.

He says that "inasmuch as some colonies died that had no young brood. the argument becomes inconclusive."
He misunderstands; the argument is not based on young brood at all, but not based on young brood at all, but the winter consumption of bread by the old bees (whether that consump-tion is induced by handling the bread in feeding larvie or otherwise), and I made the statement that in my caremade the statement that in my careful observations I had noticed that "neary all those that died had brood in all stages," to give the idea that the greatest cause of pollen-eating by the older bees came from brood-rearing. Let us examine almost the first position assented to by Mr. Clarke. quote:

"I can understand that it may and probably does interfere with successful wintering to have brood-rearing ear-ried on too late. It necesitates a good deal of nurse-work, and more activity generally than accords with that state of quiescence which we know to be so desirable."

"We know;" why, Mr. Clarke, I only said I "gnessed." I stood loto I. I dare not say "I know" too much about that "quiescent" state, for see the opinion of so careful an observer as Mr. Chas. Dadant, in BEE JOUNNAL of Nov. 9, page 351. 1, return your of Nov. 9, page 354. I return your advice, "go slow." Recant; be as modest as I was in the article you attacked, and say "we guess." Remember, whatever you may say upon this wintering problem, men of large experience are ready to take the argu-

But what are we to understand by the above statement? That in Mr. Clarke's locality bees carry on broodrearing in the fall, after the commencethat ever the rule anywhere? He seems to mistake the condition of things. This brood that we find is spring brood, and not fall.

I did not say, nor assume, that beebread was poisonous, and because I believed that such portions as the bees often indulged in were the cause of dysentery, why should Mr. Clarke drag in this venomous word 'poison," any more than I should, because he admits that eating "too freely" of it might perhaps cause trouble? If it should cause trouble in the the word "poison?" If that trouble should cause trouble should a use the word "poison?" If that trouble should be claimed by me to reach as far as dysentery, even unto death, should Mr. Clarke set up a straw man of "poison" to combat? Is it not as easy to answer what I wild as what I easy to answer what I said, as what I did not say? Men do not, as a rule, eat poison, but they still continue to partake of food that causes intestinal diseases, unto death.

I thought I had made it clear that I believed that the eating of bee-bread by the older bees, during continued confinement, was the cause of dysentery, compared with which, as a cause of our loss of stock, all other causes combined fade into insignificance.

I think I need waste no time in re plying to Mr. Clarke's claim that he is of the opinion that pollen is necessary (or may be) for the most successful wintering of bees. I see that he is not capable of convincing me, through my reason, that nitrogen, carbon, hydrogen and oxygen are so arranged in the gen and oxygen are so arranged in the bread that it is (under the conditions I have named) necessary or even wholesome to the bees. Hives compared to honses, and bees to cows and horses, are in my mind rather poor comparisons. Horses, like other large animals, are governed by the same laws with results among respectively. laws winter and summer. Not so with bees at all. He asks, "If pollen pre-vents dysentery in summer, does it cause it in winter?" From the first cause it in winter?" From the first part of the proposition 1 dissent, to the latter I answer, yes. Never mind Mr. Von Morlott, whoever he may be, but demolish us one at a time, please.

1 think Mr. Clarke underrates himself when he says that bees in "many things are far wiser" than he. I may things are far wiser that he. I may be in error in this regard, however, and will "go slow," making no rash statement to get picked up on; but 1 am sure that the successful results arising from bee instinct are not born of knowledge at all. If from knowledge, the bees really may be, and according to him are his superiors sometimes at least, for he says that though he knows that porridge is good and necessary for him, he is strongly tempted to give it the go-by, though he is sure the bees will only take that which is best for them.

I explained fully that I thought they are layer only when the facilities for

ate bread only when the facilities for getting at, or the attraction of the quality of the honey was against them. Finally, Mr. Clarke comes to a serious close by telling us what we do know. I will not occupy space by quoting them, for we all know that we cannot them, for we all know that we cannot control temperature unless in special repositories, and we have further demonstrated that, one year with another, said repositories have little or nothing to boast over the changeable out-door position.

We also know that "quietude" is an effect, and not a cause. We do not know that those who use, or pretend We do not to use division boards succeed any better than those who do not; but we do know that in spite of any and all sorts of "fall preparations," dysentery

sorts of "fall preparations," dysentery claims whole apiaries for its own "Spreading combs" has also signally failed, to our certain knowledge.

I never had, or pretended to have, any "bacteria," but only threw out a bacteria hypothesis. All those who believe in the detrimental effects of cider honey and all fermented honeys among which is Mr. Chas. Dadamt, are bacteria-ites, are they not? What is the offermentation but bacteria? If I unlittle.

derstand the primary principle of chemistry correctly, wipe out of existence bacteria, and fermentation and decomposition are things of the and decomposition are timings of the past only. Did any one think that I made bacteria? All I did was to suppose a new species of this well-known race of microcoxi, and say, "let us reason together," hoping to possibly point in a direction where some man of more ability and time point in of more ability and time might find the evil genius. No one ever answered any argument upon that hypothesis, but a few spent all their force trying to identify the supposition with me as an assertion.

Now, many of those who believe the pollen theory" absurd and false, are working hard to settle it firmer with me than it belongs, while those who corroborate the theory never mention my name. Such charities are com-

If the future years of experience should positively demonstrate that bee-bread, nitrogen, carbon, hydrogen, oxygen and all combined, was the real cause of dysentery, will you, Mr. Clarke, couple it with my name with the same carnestness you do now? I feel that you will, and I will return the favor by trying to keep in its proper place any discovery you may be directly or indirectly the parent of, if ry such circumstance ever happens. Dowagiae, Mich., Nov. 19, 1881.

For the American Bee Journal.

#### Size of Frames and Hives.

J. S. DUNCAN.

I commenced the season with five frames. Not satisfied with the small frames. Not satisfied with the small frames, I adopted one 10x15, calculated to hold six 5x5 sections; the hive is for exclusive side-storing, and has a conventive for 11 frames (16x214x11). a capacity for 11 frames (16x21x101s) a capacity for 14 frames (16x21x10½) when worked for extracted honey, or 3 frames of sections on each side of brood nest. I allowed natural swarming; one absconded; after this I caged the queen and hung her where the bees were settling, but very soon they were all in the air again, leaving about a quart of bees with the queen. Even the action of the heav street the From the action of the bees after the excitement of swarming and loss of the queen, it is evident that they lose all recollection of their old home, as they are liable to go into any hive, or several hives, making great confusion among the surrounding colonies.

In queen-rearing I had a case similar to that described by your Kansas correspondent, on page 118. I formed 3 colonies with ripe queen cells; ex-amined them next day and found the cells all open, while one of the queens had a comb partly filled with eggs. On examining the comb I found it had been cut open, the intruder being a queen I had doubts about, as she had been in another hive 16 days and had not commenced laying. I examined the hive this queen was in after leaving the others, and picking her off the comb threw her into the air to test her wings; she circled around the yard several times, and on returning went into the wrong hive, was accepted, and has proved to be a very good queen.

My honey carriage is a small hive mounted on a boy's express wagon I bought for a dollar, and has all the conveniences required in an apiaryboxes for scrap wax, fuel, queen cages, nails, dissecting knife, veil, gloves, or anything that may be required; the cover of the box being a handy recording desk, racks for a smoker and ham-mer, and a comb-holder that does not revolve. It is not patented and never will be. It is more convenient than a will be. wheelbarrow; one great advantage is in having one hand at liberty to guard gainst any of those ferocious bees that may happen around.

My bees are all in fine condition, and any nees are all in one condition, and packed for winter on from 3 to 6 frames (according to size of the colony), with a division-hoard on each side and a thick cushion on top; did not remove the oil-cloth, but spread the frames a

I think it would be a good plan for correspondents to give size of frames and capacity of hive when writing about bees. It would give the editor and his readers a better idea of the writer as a bee-keeper, a great help to beginners, and might be the means of adopting a unitorm hive in America.

My profit from capital invested in ees is 40 per cent., all my investments being permanent, such as extractor, smoker, etc. My increase is 250 per cent., which pays me handsomely for the pleasure I have had with my bees, Browning, Mo., Oct. 27, 1881.

For the American Bee Journal.

### The Disposal of Honey.

GEO. W. HOUSE.

Since the publication of my article and the comments thereon in the American Bee Journal for Sept. AMERICAN BEE JOURNAL for sept. 14, I have again visited our larger eastern markets, and I am still more confident that the position I have taken on the subject is correct. Time. however, will tell.

I notice the editor on the first page of that issue takes exceptions to the desirability of centralizing the honey traffic, and says: "The proposed centralization or co-operation is impracticable, for the reason that the necessities of hee-keepers vary as much as do their ideas regarding hives, win-tering, etc. As a rule, the heavier producers have their outlets to mar-ket already established, or have had sufficient experience to be able to sell in job lots to the best advantage. These men of course would see no advantage to be derived from co-opera-tion, and would not jeopardize their established trade by entering into the scheme."
The only "necessities" that bee-

keepers have in marketing their products, is to realize satisfactorily on their consignments as quick as possi-ble. To best attain this point would be to sell for *cash*; and that is what I have been laboring so hard to perfect; see page 291. American Bee Journal, where I said, "when we can concentrate our honey, we shall be able to sell for cash, and we shall see buyers traveling the country to purchase ers traveling the country to purchase the test. Since that writing we have had the pleasure of seeing men traveling the country buying for cash. This, no doubt, is owing to the carnest work and diligent effort on the part of the heavier producers in this State to concentrate our honey, and we are now required our recovery. we are now reaping our reward.

One firm, in particular, with a capital of lifty millions of dollars, have decided to handle honey on a cash basis altogether, and undoubtedly they will endeavor to control that market to a certain extent. In doing control will be a control to the control of th so, they will be obliged to buy up the small consignments of honey finding their way into the hands of commission men who do not scruple at culting the prices. This is right, because they could not pay good prices, know ing that those small consignments would surely be closed out much below the market, thus having a tendency of lessening the prices, and working ruin to the firm making it their special business.

There are a very few commission houses in New York that make a specialty of our products. These men will co-operate in sustaining the prices. But of the many commission men, 99 out of every 100 have not the men, 99 out of every 100 have not the facilities for handling honey. They must necessarily have a special room or department for it, which fact is proved by the few making the husi-ness a success, besides many other little matters pertaining to the busi-

ness.

I do not understand why the editor should call this feature a "scheme, Centralization is important to the

to do this, we must encourage the buyer or middleman.

While in Boston, a firm told me they while in Boston, a firm tool me they could sell more honey, and it would command higher prices if the honey was contined to 3 or 4 wholesale houses. This firm are trying to control that market as regards prices, and they are right in their opinion, because there would not be that running from one commission house to another by the retailer, to pick up bargains that may be offered, and after-wards reporting the same to other houses in order to secure the same advantages.

one man should consign 1000 lbs. of honey to each of 10 commission merchants, in nearly every case you merchants, in nearly every case you would find that honey setting in plain sight where every passer-by would notice it. The retailer or grocer in passing along, sees honey in the hands of their commission men; the first idea that strikes him is. "Why, there must be a vast amount of honey in the market. What a splendid opportunity I shall have to buy cheap. But I must wait a while, for fear that the market will be glutted, and the bottom knocked out of the prices."

If the 1000 pounds were put into the hands of one man, the producer would realize on his consignment much sooner, and at far better prices, be-eause the retailer or buyer would feel safe in putting in his stock, knowing that the prices would not be cut, nor the market glutted.
While in New York, I found honey

in the hands of tea commission firms; flour commission houses; hop commission merchants, and so on through the list. I took the position of layer, and upon making inquiries under the pretense of desiring to purchase, I was enabled to get their manner of doing enabled to get their manner or business for us honey producers. If this was not a fair test, and the best way to obtain the real facts, will some please say what is? Men may one please say what is? Men may write, and men may theorize; but to obtain knowledge, we must have practical experience.

tical experience.

If you wanted to buy but a few crates or eases of honey, it could not purchased much under the market see. But I found that they were desirons of closing out the whole consignment, and to get it off their hands, would sell for 25 per cent, under the market. And again, not making a specialty of the business, they had no special place or department for the consignment, but it would be piled up among various other goods, and some out on the street, broken, leaky and

Reader, do you think this manner of marketing your products is satisfactory and business like? Do you think you would realize as much, or get returns any quicker? Or would it not be better for us all to have our though the better for us all to have our honey neatly piled up in a room where no other goods are kept, and arranged so as to compare favorably with the other consignments beside it, and in the hands of a thoroughly reliable and competent man, who has an established honey trade?

Reader, this matter rests with us; the sooner we perfect a system of marketing (concentrating our honey), the quicker will we see "wholesale honey merchants" springing up; when we shall be able to dispose of our pro-ducts for eash, and at good prices; fluctuating in price no more than any of the agricultural products.

On page 315, AMERICAN BEE JOUR-NAL, Mr. Heddon says: "Buyers are bears,' for it is to their interests to depress the wholesale price of honey. Commission men are the boney. Commission men are the bulls, for they are working for our interests, and hold up the prices to the

oest of their annity.

In this I cannot agree with Mr.
Heddon. It seems to me the above
quotation is right to the reverse of
what it actually is. I will give a case of actual occurrence that I happened

would not sell for less. Therefore he placed the honey in the hands of a placed the honey in the hands of a commission merchant, and before he was out of town, the honey was sold for 16 cents to the same firm that offered him 17 cents. That man, undoubtedly, will never sell on commission again, as that transaction cost him nearly \$100.00. Yet such transactions are of frequent accurrance.

actions are of frequent occurrence.

As a rule, the commission men are the "bears," because all the interest because all the interest they have in the matter is to get their per cent. of commission, while the wholesale dealer or middlemen are the "bulls," because it is to their interest to sell their own goods at the best posbecause it is to their interest. sible prices

From what I have seen and know by actual transactions, I cannot see how honey will bring more money to us put into the hands of the retailer through the commission house

my position on this question. There is no "scheme" about it, but simply the duty of each and all of us for the protection of our interests. I have no doubt said enough in this to clearly define my position in this cause, to the reader and all interested. When we each work for our own interests we work for the interests of each other. Therefore I shall stand firmly on this rock, knowing full-well that time will sustain me in this work for the interests and benefit of the fraternity.

I heartily endorse the action of the A MERICAN BEE JOURNAL in the issue of Nov. 16, in the denouncement of "glucose" and its "advocates." It is the duty of all our periodicals to pour red-hot shot and shell into the camps of those advocating "glucose" in any manner.

I am also pleased to see the Ameri-

CAN BEE JOURNAL again falling into line by encouraging debute, etc. This is what placed the BEE JOURNAL at the head 12 years ago. And it is that spirit that brought out many facts and

settled doubts in years gone by.

To get at facts, we must admit free discussion. Facts are more important than favors. To reach the real value, we must compare—add and subtract, till the actual result appears.

Whoever brings before the public a new article, or advances a new theory must expect, and ought to solicit critmust expect, and ought to some cricism, until all the points are brought out independent of theory. To oppose this shows a want of confidence in the merits of the article or question

Fayetteville, N. Y.

From the Farmers' Home Journal.

### The Yellow Italian Bee.

A. P. FARNSLEY.

When I was a boy, I was very fond of watching the bees. I would stand and watch them for hours, and never tire of seeing them going out and and watch them for notals, and never tire of seeing them going out and coming in laden with the pollen of the flowers. Now, my recollection is that these bees I took so much interest in when I was a small boy, were yellow, and had the yellow bands around the abdomen, like the Italians.

I remember when looking at them the negro men at dinner time would come to where I was, and talk to me about them, and about my fondness for them; and I distinctly remember one of the men used to tell me about the wild black bees that made their homes in the woods; and I remember when the bees in some of the hives changed to black bees, the man re-ferred to accounted for it by saying the wild bees drove out the tame ones, and took possession of their homes. Now, so vivid is my recollection of the cellow bees with their golden bands. that the first time 1 saw the Italians bees they reminded me of old friends of long ago, and by association I was carried back to the scenes of my youth, when I was as happy and free from care as the beautiful forms I was theavier producers, and equally important to the of actual occurrence that I happened of long ago, and by association I was carried back to the scenes of my portant to the lesser producer. They both are working for the same end, viz; to dispose of their products for spot cash upon delivery. To be able to witness:

A hec-keeper arrived in New York with 14,000 pounds of comb honey, He was offered 17 cents in cash for his so fond of watching going in and out of the hives.

Dr. Allen informed me that parties in Arkausas claim that they had the In Arkansas claim that they had the yellow bee with the bands long before the war. Aristotle describes very fully two kinds of bees—the yellow and black bee. The yellow bee was lost sight of for several centuries. They were discovered by one of Natschwick efficies when he caused the oleon's officers when he crossed the dps. They were introduced at that Apps. They were introduced at that time into France. Now, am I wrong in my recollection of the bees I watched in my youth, or is it possible that the Italian bee was introduced into Louisiana by the French when that country belonged to France, and that they migrated north till they reached Kentucky, or that they were brought from Louisiana here early day by persons here who annually visited New Orleans to trade? Men used to go from my neighborhood annually, before 1812, to New Orleans to trade. Some of my father's brothplaced in the retailer's hands through the wholesale honey house.

I think the editor has misunderstood

to trade. Some of my father's brothers went from here at a very early period, to Louisiana for that purpose.

Now, if the bees I watched when I was a small boy were Italians, or descendants of Italian stock, and if the vellow bees that were in Arkansas before the war were descendants of Italian stock, then the Italian bee was first introduced into this country when Lonisiana belonged to France.

I would like to hear from some of our Arkansas friends on this most in-teresting question, and also from others who know any thing about the others who know any thing about the yellow bees of 40 years ago. Especially would I like to hear from Mr. T. S. Kennedy and Gen. C. M. Clay, whose many opportunities for observing these insects will enable them to say something of general interest to the readers of your paper. The latter gentleman, while in Mexico in 1846, were have seen bees of that country. may have seen bees of that country.

For the American Bee Journal.

### Size of Hive for Comb Honey.

A. R. KOHNKE.

In answering a question of Mr. Sears, of Girard, Pa., as to the size of hive for comb honey, the editor of the BEE JOURNAL says that the Langstroth is the one he prefers. But he is probably aware that there are 2 sizes of that him improved the process. of that hive in general use, one of which holds 10 frames, which Mr. Muth, of Cincinnati, uses; the other being an 8-frame hive, Mr. Heddon prefers to the exclusion of all others.

To arrive at a correct size of a hive, we should first find out the desirable qualities of such. 1. The hive and frame should be shallow enough to prevent the bees from storing too much honey just above their brood nest in the brood chamber, and it appears to me that the Langstroth frame is admirable for this purpose. Second, the queen should have suffi-cient room to deposit as many eggs as she ean, besides leaving room enough for the bees to store honey and pollen for use in the broad chamber. This atter takes on an average about 2 inches under the top bar of each frame, being less in the middle and more on the ontside frames, or about more on the outside frames, or about  $\frac{1}{4}$  of each frame. One frame of comb 8x16 contains 6,400 cells; 8 frames, 51,200, and 10 frames, 64,000, three-fourths of which serve for brood rearing, or 44,800 and 56,000 respectively. Now I will leave this part of calculating, and commence at the other end,

Mr. Langstroth says in his book, "the queen lays 6 eggs per minute," which, to grant all the advantage pos-sible, I will admit to be the case at the sible, I will admit to be the case at the height of the honey season. But that would make 360 eggs per hour, and 8,640 per day; at that rate it will take only from 5 to 6 days to fill an 8-framer, and from 7 to 8 days a 10-framer, and the queen would lill, in 21 days (the time bees hatch from egg), 181,-140 cells, or 30 frames.

(the time bees lated from egg), 181,-440 cells, or 30 frames. Prof. Cook, in his Manual, puts it at 4 eggs a minute, or 5,760 per day, at which rate an S-framer would be filled in less than 9 days, and a 10-framer in less than 11 days, or 20 frames in 21 days. I do not think we

have such queens, though he claims that about 3,000 eggs per day is the average of a good queen. Berlepsch says he has seen queens deposit eggs at the rate of 6 to 7 per minute, but adds that such may be extra exertious of very fertile queens at the best honey season, and he puts the number of eggs laid by a good queen at 1,200 per day. At that rate she will keep only 5 frames full of brood. Now we all know that a queen will keep from 8 to 10 frames full, and then sometimes go to depositing eggs in surplus 8 to 10 frames 1mt, and then some-times go to depositing eggs in surplus boxes for want of room; at least 1 have had such. But I think we will be justified in saying that an average queen lays at a rate of from 2,000 to 2,500 eggs per day, less than one per

minute.
As it is preferable to crowd the bees a little to force them into the surplus arrangement, I think a hive—which is large enough to accommodate a queen targe enough to accommodate a queen which lays 2.000 eggs per day at her best, is the live we want. Multiplying 2.500 by 21 days, we get 52,500 cells, which the queen wants to keep her busy. Now, that is about what an S-framer will furnish, frames of standard Langstrothsize. As I stated above, 1 have had queens which would keep 10 frames filled with brood and still he in want of more room: but I have seen more hives of 10 frames where the honey on the outside frames remained from one year's end to the other, and not more than 7 or 8 frames filled with brood, which I, taken all in all, consider proof conclusive that an all, consider proof conclusive that an s-frame Langstroth hive is preferable to any other. To prevent the queen from entering the surplus arrangement on top, it is only necessary to use small sections 4½x4½; into these, the queens will rarely, if ever, go to depositing eggs, for the reason that she seems to object to too much wood in the brood department; if in additional control of the proof department; if in additional control of the proof department; if in additional control of the proof department; if in additional control of the proof department; if in additional control of the proof department; if in additional control of the proof department; if in additional control of the proof department in the proof department.

she seems to object to too much wood in the brood department; if in addition to small sections, the latter are put on a rack made of slats nailed together, so as to leave space enough between them for the bees to get through, such as Mr. Heddon uses, the queen will never be found in them.

In the summer of 1880, 1 put into several hives frames filled with sections a little larger than 3x3, in the middle of the brood nest, which I wanted to use to start some nuclei to raise queens. The wood of these small frames was very thin, not more than 1-12 of an inch, each Langstroth than 1-12 of an inch, each Langstroth frame holding 10 of these sections. But it did not work ; the queens would not lay their eggs in so much machinery; so I had to give up that plan, and learned the value of small sections, as to where they would do the most good, and where they would not.

Though I am not yet a member of the National Bee-Keepers' Associa-tion, I would propose to have the pro-ceedings, etc., of that body published regardings, etc., of that body published in pamphlet form of the size of the Bee Journal, to have it bound in with same year, published at the cost of the Association, and each member should be entitled to one copy, non-members paying to the funds of the Association a reasonable price for it Association a reasonable price for it. Youngstown, O., Nov. 21, 1881.

[All standard Langstroth hives contain 10 brood frames.—ED.]

For the American Bee Journal.

### Theories and Facts.

J. W. WHITE.

That was a severe criticism made on a distinguished man, a generation ago, when it was said of him that "he depended on his memory for his wit, and on his imagination for his facts." But he was not alone in his glory; a similar talent is frequently manifested similar talent is frequently manifested among men of every profession or business. I was once present at a consultation between several physicians. The conclusion reached was so manifestly absurd that I ventured to ask one of them the next day, "Is there such a thing in your profession as forming beforehand a theory about what is the matter, and then making one to three combs of brood on the 14th Association met at Lansing Republican we take the following record of proceedings:

The Cont

a diagnosis to suit it?" HIs answer was: "I am sorry to say there is just such a thing in our profession, and I have to acknowledge with shame that I have m this instance been a party in the business." Another consultation was held, and a different conclusion reached. In theology men have inherited their creeds from their parents and churches, and confirmed them-selves in them by arguments drawn selves in them by arguments drawn from nature and revelation; or, giving up their traditional beliefs, they run off into the wildest speculations. What a rare thing it is to find a man who is not wedded to some pre-conceived opinion, who is an honest inquirer after the truth, and who is willing to follow the inductive method of philosophy by getting his theory from the facts, rather than making his facts conform to his theory. Blind adherence to traditions, and the equally blind reception of speculations mistaken for truths, are the two great hindrances to the world's progress in drances to the world's progress in goodness and truth.

How is it with us bee-keepers? Are we making much progress in scientific bee-culture? Beyond the use of sec-tion boxes and comb foundation, what tion boxes and comb foundation, what do we know to-day that could not be learned from the Rev. L. L. Lang-stroth's book, written more than 25 years ago? Why do we not get to the bottom of the questions about winter-ing, dysentery and spring dwindling? Is it not because we are not close ob-servers and because we are not speculate to servers and because we speculate too servers and because we speculate too much, and observe and experiment too little? Let us try to get the facts, all the facts about wintering, dysentery and spring dwindling before us, and Keep them there, and then let us be shy of anything which does not har-monize or account for all the facts. I monize or account for all the facts. I will state some things that I take to be facts; if any of them are not facts, let them be challenged and the truth presented. In keeping bees 17 years I have not made notes on every point, and may be mistaken, but I think I may call the following a statement of facts:

The colonies which wintered well were not deficient in pollen. Good colonies which starved to death exhibothers when starved to death exhibited no signs of disease from the use of pollen or any other cause. Good colonies which were confined for months in the cellar, and were short of stores so that they had to be fed in March and April to keep them from starventies above the stores of diverse of diverse of the stores of the s starvation, showed no signs of dysen-tery brought on by using pollen to save their scanty stores of honey. After removing the bees to their summer stands, generally about the second week of March, I give them an overhauling and clean out their hives; healthy or strong colonies generally or always have at that time some young bees, and more or less brood in all stages; diseased colonies, which show signs of dysentery, have very little brood, generally none at all. Howean we account for this, if brood-rearing we account for this, it brood-fearing while the bees are confined tends to give them dysentery? In this latitude (about  $40!\cancel{2}$ ), where the apples bloom on an average about the 10th of bloom on an average about the 10th of May, the locusts about the 25th of May, white clover about the 1st of June, and linden about the 1st of June, and linden about the 1st of July, unless the brood-rearing is far enough advanced in March to fill three or four combs, the bees will not be strong enough in numbers for the honey harvest. The one drawback is, during March and April the weather is sometimes so rough that the bees cannot fly to get water, and without water they cannot rear much brood. I have never had a successful year where the brood-rearing was seriously interrupted in rearing was seriously interrupted in March, unless this year is an excep-tion, owing to the good fall pasture. Last spring the colonies had each from one to three combs of brood on the 14th of March, and none on the 14th of April. After that they filled up rapidly. The old bees died off about the first week of May, and if it had not been for the warm spell of weather about that the time much of the brood

early, and some way to supply them to sign the roll. C. Thompson and with water so that they can keep on W. C. Lankton became members of

without interruption.
In the winter of 1871-2, before I had In the winter of 1871-2, before I had heard of the bad effects of pollen and winter brood-rearing, and when I knew that they reared brood in February, I fed my bees for about 5 weeks in the cellar, a mixture of honey and flour to stimulate the brood-rearing. Did they rear brood? They did. Did they get dysentery? They did not. Did they do well the next summer? It was the best year I ever had. I would not advise others to follow my example that year, unless on a very example that year, unless on a very limited scale as an experiment. But with all these facts before me, it is not wonderful that when I read statements made so boldly that pollen and early brood-rearing produce dysentery, I find myself questioning something.

There is one thing more I would like to know. I see it stated that by hav-ing the hives well filled with brood in September and October, and thus hav-ing plenty of young bees to winter, we may prevent spring dwindling. This may prevent spring dwindling, seems to be a reasonable theory. the difficulty with me is to get my bees to do as I want them in this matter. One year ago I fed them to get them to rear brood, but for all I could do they slacked off early in September to 1, 2 or 3 combs of broad to each hive, and they would not enlarge the brood nest, and with October all brood dis-appeared. Yet I had no dwindling last spring. This fall we had the best last spring. This fall we had the best and most constant flow of honey from July till October I ever saw, the hives gradually gaining in honey all the time. But it was the same as the year before, brood-rearing slacked off in September, and disuppeared early in October. I have kept a record for years of the amount of brood in the hives at different times of the spring but until the last two years paid no attention to the amount they had in the fall. Who has a record of this kind? Who can tell us the number of combs of brood in each hive, say on August of brood in each hive, say on August 15, September 1 and 15, and October 1 and 15? Who can report the number of additional frames he got filled with brood by feeding after the bees had contracted their brood-nest in September 2. We would like to have the facts. We would like to have the facts. General talk about keeping the hives full of brood, without some figures and facts, may only make us skeptical. Milroy, Pa., Nov. 11, 1881.

### Central Michigan Convention.

The Central Michigan Bee-Keepers

the Association.

The President appointed Messrs.

The President appointed Messrs. White and Wood a committee to receive questions for the question drawer, and Prof. Cook, L. B. Baker and Mrs. F. R. Mattison, a committee to answer such questions.

An opportunity was given to any who desired to relate their experience in bee-keeping during the past season, and President Ashworth was called for. He knew but little about the hees, as he had been from home most of the summer. He had 16 colonies, and they were doing well.

Mr. Langton was a beginner. He bought a single colony a year ago last

bought a single colony a year ago last spring, and made up 2 from them. He let them have their own way pretty much. They have increased to 12 colmuch. They have increased to 12 colonies and have taken about 1,200 lbs, of honey. He used chaff hives, and asked if it was advisable to remove them to a sheltered position on the south side of his barn for winter. The general expression was that they should not be disturbed.

Mr. White had 9 colonies this spring, and from them and their increase had taken an average of 125 lbs. of comb honev

Mrs. Harrison used chaff hives and had taken about 300 lbs, from 3 colonies; was making arrangements to go into the business more extensively.

Mr. Wilson commenced the winter with 9 colonies, saved 7, and those have increased to 20. He extracted about 200 lbs. and had taken about 100 lbs. of section honey. Wintered in temporary chaff lives, which he has made in sections so that they can be taken off and packed away in the spring. Used 6 inches of oat chaff spring. Used 6 inches of oat chaff around the sides. The President said Mr. Mitchell, a successful bee-keeper, used clover

chaff.
Mr. Hanchett, of Leslie, had large Alt. Hanchett, of Desne, had large experience on a small scale. Went into winter quarters with 21 colonies and came out with 4, but thought it due largely to carelessness in not produe targety to caretessness in not providing for a severe winter. He packed with forest leaves and opened his hives about April 1; they suffered from spring dwindling. A neighbor lost a large number of bees by permitting them to take their first fly in the afternoon, and they were chilled. He discussed the question of ventilation and oil cloth covers, and the general expression was adverse to the latter.

Mr. Thomas, of Brighton, had a most unfavorable location for bees, but his experience had been diversi-tied. Used the simplicity hives and wintered on summer stands. A year ago he had 50 colonies of bees; in February had lost 6. In the spring he had 20 colonies which had increased to 80, and he had taken 1,850 lbs. of extrac-ted honey and 150 lbs. of comb. His bees had plenty for winter, and were in winter quarters.

At the afternoon session, which convened at 1:30 p. m., the attendance was still light. The President an-nounced a continuance of the experience meeting, but there was nothing forthcoming. Addresses were also called for without response, and members were then requested to write and furnish to the committee any question upon which they might desire information. mation.

Mr. Waldo was called upon for his

experience, and said his bees had done remarkably well. He started a year ago with 9 colonies, and now had 25 ago with 3 colonies, and now had 23 colonies, after selling \$44 worth of bees, and he had put them away with from 25 to 32 lbs. of honey each. He had sold at least \$50 worth of honey.

A. L. Baker, of Lansing, started with 2 colonies and now had 9 strong ones, having united 2 weak ones. He tad sold 125 lbs. of honey. This was his first year's experience.

his first year's experience.
Reuben Wood had last spring 36 colonies, but 14 of them were weak. He had sold 4 and had 66 left for winter, and had taken some 1,500 lbs. of surplus honey. The bees were in good condition; he kept them in cellar last

packing was discussed, and Prof. Cook, who had just come in, stated that some of the most successful beekeepers were using it, and preferred it to anything else. He stated that he it to anything else. He stated that he should put up his bees this winter with sawdust or chaff packing in the top, leaving the bottom of the hive

L. B. Baker did not think such a plan would work, as the sawdust or chaff was not as good an absorbent as cloth, but Prof. Cook thought that position faulty, and called on Mr. Robinson, who wintered his bees in the house, and never used anything but constants. but sawdust on top, enclosing his hives in burlaps covers. Speaking of the effects of cider, he said there was a large cider-mill in his vicinity, but he had never seen any harm come from it among his bees. He handled his hees all winter his bees all winter.

Prof. Cook did not think bee-keepers need to fear for their bees during the winter, if they will only use com mon sense, and apply what is already known in regard to it. The larger bee-keepers have the matter in good shape, but their plans will not always work with a small number of colonies. The discussion was continued for some time by Messrs, Cook, Robertson, Baker, Wood, Waldo and others, and considerable was said upon the sub-ject of winter handling.

An informal interchange of exper-An informal interchange of experiences in honey-gathering during the past season, and the prospects of fall gathering, followed. Speaking of cider honey, some of the members of the Association thought that bees never stored it, but Mr. Robertson stated that he knew of his own experience that they did store if

rience that they did store it.

Prof. Cook gave in substance a pa-per by Mr. Heddon, which is some-what singular in its statements, in regard to chronic poisoning from them. He also spoke of the Syrian bees, detailing their many good qualities, but intimating that they were too cross for a beginner to handle with any

R. Wood had I colony, and he found them very quiet, but Prof. Cook thought the reason was because they were mated with Italians. Another gentleman, who took a colony from the college, said they were easily han-

dled by him.

Prof. Cook explained a new planfor securing sections into a hive which he saw, the invention of a Kentucky beekeeper, and which he believed to be superior to anything he had previously

Members of the Central Michigan Bee-Keepers Association, were invited to attend the State Convention at Battle Creek, Dee. 8 and 9, and were made

It was also resolved that the annual meeting be held in Lansing, at the Capitol, on the 3d Thursday of April,

Prof. Cook exhibited a specimen of foul brood, which attracted much attention, and Mcssrs Wood & Narmore

exhibited a very convenient hive.
The question drawer was then opened, and answers were given by members of the Association, affording much valuable information, especially

to young bee-keepers.
Prof. Cook explained how to detect foul brood, and stated that it was all around Lansing, but not here yet.

### Iowa Central Convention.

The Iowa Central Bee-Keepers' Association met at Winterset, Iowa, November 3, 1881.

The following officers were elected: A. J. Adkison, Pres.; John Graham, Vice Pres.; Henry Wallace, Sec.; Mrs. J. W. Pryor, Treas.

An executive committee was appointed to select subjects for discussion, and Moses Bailey and others to

sion, and Moses Banley and others to present specimens of honey cake. The next regular meeting will be held in Winterset on the last Thurs-day in May. HENRY WALLACE, Sec.

### The question of using sawdust for Michigan Bee-Keepers' Association.

The 13th annual meeting of the Michigan State Bee-Keepers' Association, will be held in the City Hall at Battle Creek, on Thursday and Friday, the 8th and 9th of December. The time and place makes it convenies to the convenies of the conveni The Time and place makes it convenient for those who wish to attend the annual meeting of the State Horticultural Society, which convenes at South Haven, the three previous days of the same week. The Michigan Central, Chicago & Grand Trunk, Central, Chicago & Grand Trunk, Detroit, Grand Haven & Milwankee, and the Grand Rapids & Indiana Rail-roads will sell tickets to members at excursion rates. To secure reduced fare, all must have certificates, which can be furnished by the President, A. J. Cook, Lansing, Mich. Arrangements are made with hotels for fare at

The meeting promises to be the largest and the best ever held. All bee-keepers are cordially invited to be present. Bee-keepers are requested to bring samples of honey, apparatus, and articles of interest to apiarists. The following programme has been

arranged :

THURSDAY FORENOON.

"Italian bees," S. K. Marsh,
"The new bees," D. A. Jones,
"Shall we continue to import
meens?" Discussion opened by A.

#### AFTERNOON.

"Bees and grapes," H. D. Cufting "Mistakes of bee-keepers," Dr. E

B. Southwick.
"Honey as food," Dr. J. H. Kellogg. "The future honey market," Newman.

"Crumbs from the table of the National Convention," President's ad-

"Adulteration," Dr. J. H. Kellogg, "Apiarian implements," Hon, A.B. Cheeney.

#### FRIDAY FORENOON.

Rearing and selling queens," W.

Z. Butchinson. "Foundation," James Heddon, Address, A. I. Root.

### AFTERNOON

"Foul brood," C. F. Muth.
"Extracted honey," Chas. Dadant.
"Hints," T. F. Bingham.
Election of officers and reports.

### EVENING.

"Wintering," O. O. Poppleton, D. Jones, C. F. Muth, and others.
Miscellaneous questions.
A. J. Cook, Pres.

T. F. BINGHAM, Sec.

The South Eastern Michigan Bee-Keepers' Association, will hold its annual meeting at the Court House in Ann Arbor, on Thursday (and per-haps Friday), commencing Dec. 15, 1881, at 10 a.m., for the election of officers for the ensuing year, and such other business as may be brought before the Association. A good aftendance and interesting meeting is ex-Several subjects of interest

will be discussed by able men.

N. A. PRUDDEN, Pres.
G. J. Pease, Sec. protem.

The Texas State Bec-Keepers' Convention will be held at McKinney. Texas, on Tuesday, April 25, 1882.

The annual meeting of the N. W. Illinois and S. W. Wisconsin Bee-Keepers' Association, will be held in Temperance Hali, Freeport, Stephen-son county, Ill., on the 47th and 48th

JONATHAN STEWART, Sec.

The Nebraska State Bee-Keepers' Association will hold its annual meeting in Ashland, Neb., on the 12th and 13th of January, 1882. A cordial invitation is extended to all who are interested in bee-culture.

T. L. VONDORN, Pres., Omaha. G. H. HAWLEY, Sec., Lincoln.

Still Gathering Honey.—While beekeepers in the North and West are put to their wits end to keep their bees from freezing, we in beautiful Texas are not bothered that way. Although the season has been dry, my bees did well, and are still gathering a little honey from Spanishneedle and smartweed, and breeding right along, I have drones flying yet. I have some honey to extract yet, and when all is gathered it will amount to about 9,000 lbs, of extracted honey, and 1,000 l-lb, sections, from 100 colonies. I have worked are a good beautiful and the sections are sections. worked up a good home market, and sold nearly all my crop at 15c, for sections, and 10c. per lb. for extracted. Honey put up in nice, neat packages will always sell, and run the old-fashwill always sell, and rul the om-lash-ioned strained honey out of the mar-ket. I wish the Weekly Bee Journal much success. J. W. Eckman. Richmond, Texas, Nov. 18, 1881.

Mississippi for Bees and Honey. This has not been a good honey season; for 2 months in the summer the son; for 2 months in the summer the bees gathered nothing, but in the fall they made up much of the loss. My bees gathered honey up to Oct. 20. I think the Mississipi Valley is the best bee country in the World. I have sold over \$500 worth of honey from 10 colonies. Much of it was comb honey, and I sold it in St. Louis at from 14 to 20 cents per pound. This is the best business in this country. I shall increase to 150 colonies next year. I cannot do without the BEE JOURNAL. increase to 150 colonies next year. I cannot do without the BEE JOURNAL.

Greenville, Miss., Nov. 18, 1881.

Introducing Queens .- We hear many complain of losing queens when intro-ducing them. I will give my plan which has always been successful both with virgin and fertilized queens. Remove the queen to be superseded, if they have one, then about noon, when the workers are all out, remove the hive 3 to 5 steps, and place an empty one on its stand; open the one removed, take out one frame, brush the bees down in the hive, place this frame in the empty hive where the workers are gathering, then let the queen crawl are gathering, then let the queen crawl out of the eage on the comb; the workers will find themselves in a strange hive, and consequently will hum around the enfrance a few minutes, then gradually ascend the one frame inserted, finding a strange queen in a strange hive, and will receive her. In 10 to 20 minutes you may proceed with the other frames, brushing the bees down in the hive removed till all are taken out and placed with the first frame removed, when the bees will be naturally one by one leave the hive and return to their old stand; the and return to their old stand; the young bees will remain till the last, then you may place them near the entrance, and let them crawl in. I hail the BEE JOURNAL as a tried friend.

G. W. ASIRY.
Valley Station, Ky., Nov. II, 1881.

Apiary Record Book.—I will take 2 copies if you, Mr. Editor, will get if up. I think the BEE JOURNAL is a splendid paper. Its weekly visits are a pleasure to me, for it is so full of bee news.

W. K. Lewts.

Dry Ridge, Ky., Nov. 19, 1881.

From an A B C Scholar.—I have read the Weekly Bee Journal for some months, and think it is just what every A B C scholar needs to post him up, and so send for it for next year. As it comes every week, it keeps up a fresh and keen interest. I do not know how I could get along without it. Henry Tilley. Castle Hill, Maine, Nov. 14, 1881.

Subscriptions may commence with the first number of any month in the year.

### Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Articles for publication must be

written on a separate piece of paper from items of business.

Photographs of prominent Apiarists Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the old as well as the new address.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

An Agreeable Dressing for the Hair, that will stop its falling, has been long sought for. Parker's Hair Balsam, distinguished for its purity, fully supplies this want.

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them. expense of collecting them.

# King Fortune-Maker, **OZONE** A New Process for Preserving all Perishable Articles, Animat and Vegetable, from Fermentation and Putrefaction, retaining their Odor & Flavor.

"OZONE-Parified air, active state of oxygen." Websten.

Preservative is not a liquid, packle, or any of the old and exploded processes, but is shu (OZONE), as produced and applied by an entirely new pocess. Ozone is the antiseptic ry substance, and possesses the power to preserve animal and expetable structures from the in a partial of the careful Habbe to decay or spoil which Ozone is nothing on the face of the careful Habbe to decay or spoil which Ozone Preservative, will not preserve for all time in a perfectly fresh and pal

There is nothing on the face of the earth liable to decay or spoil which Dome, the new Preservative, will not preserve for all time in a perfectly fresh and pulntable condition.

The value of Ozone as a natural preserver has been known to our abler chemists for years, but, and now, no means of producing it in a practical, mexpensive and shaple manner, have been discovered. Micro-copic observations prove that decay is due to septe matter or annual germs, that develop and feed upon animal and veretable structures. Ozone, applied by the Prentiss method, seizes and devery article that can be thought of, preserved by this process, and every visitor is welcome to come in, taste, smell, take away with him, and test in every way the merits of Ozone as a preservative. We will also preserve, free of charke, any article that is brought or sent prepaid to us, and return it to the sender, to him to keep and test.

FRESH MEATS, such as beef, muitton, veaf, pork, poultry, game, 48h, &c, preserved by this method, can be shaped to Europe, subjected to atmosphere changes, and return to this country in a state of perfect preservation.

EGGS can be treated at a cost of less than one dollar a thousand dozen, and be kept in an ordinary room six months or more, thoroughly preserved, the yolk held in its normal condition, and the eggs as tresh and perfect as on the day they were treated and will sell as strictly "choice. The advantage in preserving eggs is readily seen; there are seasons when they can be bought for sor levents a dozen, and by holding them, can be sold for an advance of from one hundred to three hundred per cent. One man, with this method, can preserve about organ aday.

FRETTES may be permitted to ripen in their native climate, and can be transported to any part of the word. The linee expressed from fruits can be held for an indefinite period without termentation—hence the great walue of this process for producing a temperance beverage. Cider can be held perfectly sweet for any length of time.

FRETTES and the permitt

couse.

Inothing that Ozone will not preserve. Think of everything you can ay or spoil, and then remember that we guarantee that Ozone will preserve it you want it for any length of time. It you will remember this, it will save inther Ozone will preserve this or that article—it will preserve anything and think of. that is hable to sour, decay or spot), and then remember that is hable to sour, decay or spot), and then remember thus, it will save in exactly the condition you want it for any length of time. It you will remember thus, it will save asking questions as to whether Ozone will preserve this or that article—it will preserve anything and everything you can think of.

There is not a township in the United States in which a live man cannot make any amount of money, from \$1,000 to \$10,000 a year, that he pleases. We desire to get a live man interested in each county in the United States, in whose lands we can place this Preservative, and through him secure the business which every county ought to produce.

# FORTUNE Awaits any Man who Secures Control of OZONE in any Township or County.

A. C. Bowen, Marion, Ohio, has cleared \$2,000 in two months; \$2 for a test package was his first investment. Woods Brothers, Lebanon, Warren County, Ohio, made \$4,000 on eggs purchased in August and sold n November; \$3 for a test package was their first investment.

F. K. Ruynond, morristown, Belmont County, Ohio, is clearing \$2,000 a month in handling and sell-ng Oloone; \$3 for a test package was his first investment.

D. F. Weiber, Charlotte, Eaton County, Melt, has cleared \$1,000 a month since August; \$2 for a test ackage was his first investment.

J. B. Gaylord, 81 LaSalle street, Chicago, is preserving eggs, truit, etc., for the commission men of hicago, charging 12gc, per dozen for eggs and other articles in proportion. He is preserving 5,000 eggs er day, and on his bisness is making \$3,000 per month clear; \$2 for a test his first instance.

The Cincinnati Fred Co., 408 West Seventh Street, is making \$3,000 a month in handloor bearried. The Cincinnati Fred Co., 408 West Seventh Street, is making \$3,000 a month in handloor bearried by Ozone, it keeps maked.

stancat. The Cincinnati Fred Co., 498 West Seventh Street, is making  $\hat{x}_1(s)$  for a test package was his first instance. The Cincinnati Fred Co., 498 West Seventh Street, is making  $\hat{x}_1(s)$  amonth in handling browers int, preserving and shipping at as fee to all parts of the country. Malt unpreserved sours in 24 hours; esserved by Ozone, it keeps perfectly sweet for months. These are instances which we have asked the privilege of publishing. There are scores of others, like to any of the above parties and get the evidence direct. So, to prove the absolute trail of everything we have said in this paper, we propose to place in any person who doubts any of these statements, and who is interested sufficiently to make theting, will pay all traveling and hotel expenses for a visil to this city, if we fail to prove any statement it we have made.

### HOW TO SECURE A FORTUNE with OZONE

A test package of Ozone, containing a sufficient quantity to preserve one thousand dozen eggs, or other articles in proportion, will be sent to any applicant on receipt of \$4. This package will enable the applicant to pursue any line of tests and experiments he desires, and thus satisfy himself as to the extraordinary ments of Ozone as a Preservative. After having thus satisfed misself, and had time to look the field over to determine what he wishes to do in the future—whether to self the article to others or to couline at to his own use, or any other line of policy which is best suited to him and to his township or county—we will enter into an arrangement will him that will make a fortune for him and give usegood profits. We will give exclusive township or county privileges to the first responsible applicant who orders a test package and desires to control the business in this locality. The man who scenares control of Ozone for any special territory, will enjoy a monopoly which will surely curich him.

control of Ozobe for any special territory, whitenjoy a monopoly secure an exclusive purish him.

Don't let a day pass until you have ordered a Test Package, and it you desire to secure an exclusive privilege, we assure you that delay may depire you of it, for the applications come into us by scores every mail—many by telegraph. "First come first served," is our rule.

If you do not care to send money in advance to the test package, we will send in C.O. D., but this will put you to the expense of charges for return of money. Our correspondence is very large, we have all we can do to attend to the shipping of orders and giving attention to our working agents. Therefore, we cannot give any attention to letters which do not order tozone. It you think of any article that you are doutfin about Ozone preserving, remember we guarantee that it will preserve it, no matter what it is.

What it is.

REFERENCES.—We desire to call your attention to a class or references which no enterprise or firm based on anything but the soundest business and highest commercial ment could secure. It is a soundest business and highest commercial ment could secure to the control of the remains Preservative, to the following a by permits of the remains of the remains Preservative, to the following a permit of the control of the remains of

### The Most Valuable Article in the World!

# The Bee-Keeper's Guide;

MANUAL OF THE APIARY, By A. J. COOK.

Of Lansing, Professor of Endonology in the

State Agricultural College of Michigan.

320 Pages: 133 Fine Blustrations

This is a new edition of Prof. Cook's Manual of the Apary, enlarged and elegantly illustrated. The first edition of 3,00 copies was exhausted in about 18 months -- a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation ssient research. It comprises a full defineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees, shrubs, etc., splendidy illustrated—and hist, though not least, detailed instructions for the various

manipulations no essary in the aparry.

This work is a mosterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apparent. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—L.Apaculture, Paris.

I think Cook's Manual is the best of our American works.—LEWIST, COLBY.

It appears to have cut the ground from under turne book-makers. British Bee Journal.

Prot. Cook's valuable Manual has been my constant goide in my operations and successful management of the aparty.—J. P. WEST.

agement of the apany.—J. P. WEST.

I have derived more practical knowledge from Prot. Cook's New Manual of the Apary than from any other book.—E. H. WYNKOOP.

ny other book.—E. H. WYNKOOP.
This book is just what everyone interested in ees oncht to lance, and which, no one who obtains i, will ever reguet having putchased.—Mich. Far.,
To all who wish to engage in bee culture, a cantial is a necessity. Prof. Cook's Manual is an shaustive work.—He rid, Monnecho, Ill.

exhaustive work.—Herita, Monticeno, III.

With Cook's Manual I am more than pleased. It
is tody up with the times in every particular. The
richest reward awaits its author.—A. E. WENZEL.

My success has been so great as to almost astonish myselt, and much of it is due to the clear, disinterested information contained in Cook's Manual.—Will, VAN ANTWERP, M. D

unl—WM. VAN ANTWERF, M. D.
It is the latest book on the bee, and treats of both
the bee and lives, with their implements. It is of
value to all bee-raisers.—Ky. Live Stock Record.
It is a credit to the author as well the publisher.
I have never yet met with a work, either Freuch
or toregin, which I has so much.—I'ABBE DU
Bots, editor of the Bulletin D'Apiculteur, France.

Bots, editor of the Bulletin D'Apiculteur, France. It not only gives the natural bistory of these industrous insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of thorey producing plants, and an extended a count of the enemies of bees.—Democrat, Pulaski, N. Y. We have perused with great pleasure this rade merim of the bee-keeper. It is repiete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—Agricultural, Quebec.

This book is propounced by the press and leading.

and practice as advised.—Agriculturist, Quebec.
This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee manually welcone, and it is every experienced bee man will welcone, and it is essential to every impateur in bee-culture. It is handsomely printed, neatly bound and is a credit to the West.—Wrstern Agriculturist.

### Weekly Bee Journal-Its First Year.

Almost one year ago we reluctantly ventured upon the doubtful experiment of publishing the BEE JOURNAL weekly, as we fully appreciated the vast amount of unremitting labor to be expended upon it. Many of our friends, especially among those most competent to realize the task, advised us against taking the step, anticipating either a diminution of interesting matter in our pages, or a lack of ability to keep a weekly up to the proper intellectual standard. But we could not resist the impulse—a monthly visit to our readers was too infrequent to do all the work we hoped to accomplish; our space was too limited to accommodate our numerous correspondents; four to seven weeks was too long to withhold answers to letters seeking information, the delay often proving embarrassing to the inquirer, and scientific discussions covered too great a breadth of time to be of the most practical value.

We are free to admit, however, that the above were not the only considerations which induced the change—we felt that with a weekly issue we could do more to advance scientific apiculture, to correct existing abuses, to incorporate fixed and rational reforms, to further the pecuniary interests of our readers, and to develop a great entirely lost to the Monthly and Semi- colony as a strong one; which will at closed, and drafts opened. O gives a

a gratification to know that our more intelligent bee-keepers appreciate our | will not regret it. labors in their behalf, and that all honest men approve our efforts in correcting abuses. Many scores of letters have given us encouragement. The following is just received from Mr.W. Z. Hutchinson, correspondent of the Country Gentleman, and with whose writings bee-keepers are familiar:

In my humble opinion, the present volume of the Bee Journal is far superior to any of the past volumes. I fear that we do not all realize how much editorial work, work, work, has been expended upon this volume. I thank you for the work that you are doing for us bee-keepers.

The current volume of the BEE Journal will comprise, when completed, 416 pages, containing 1,664 columns, treating upon every variety of subjects relating to bees and bee-culture, and all furnished postpaid for only \$2. Many articles published in the Journal the past year for the first time, have each been worth the price of subscription to many readers. We have given nearly 100 pages of editorial reading, have to the best of our ability answered all queries asking for information, have carefully collated from and accredited to our exchanges such articles as we thought would be of general interest, and have carefully revised correspondence when necessary to make it acceptable to the public and creditable to the writer.

And yet we are not content. We find our correspondence is accumulating, notwithstanding our enlarged space, and the present form of the Bee Journal does not give perfect satisfaction, though it is the best we could do one year ago. We have, therefore, perfected arrangements to make further improvements for the coming year. We shall somewhat reduce the size of the pages, and print 16 instead of 8, as now, giving about one-fourth more reading matter. This will give a volume of 832 pages, or 2,496 columns for \$2, and when bound at the end of the year, will make a hook worth ten times its cost to any bee-keeper.

The Monthly and Semi-Monthly editions will be supplied in the same manner as heretofere, but of the newer form. We cannot refrain from advising our Monthly and Semi-Monthly  $subscribers to take the \, Weekly instead,$ though it be for a shorter time. Articles of great interest frequently appear in intermediate numbers, as also rejoinders in controversies, which are as safe and certain for a medium weak

source of national wealth. It has been Monthly subscribers. Try the Weekly BEE JOURNAL for 1882—we think you

### The Successful Wintering Problem.

Notwithstanding much has been

said and written regarding the requisites for successful wintering, the problem seems about as far from a satisfactory solution as it was a score of years ago. In Russia, in order to evade the rigors of winter, a deep pit or subterranean vault is dug in the ground, and the "gums" containing the bees are piled one above the other several feet below the surface; then a strawhut is constructed above-ground. over the pit, with a door for ventilation in the leeward side, to carry off the moisture and heat from the bees. If 50 per cent. of the bees survive till spring the bee-keeper feels much encouraged. In our Central and Northern States, cellar repositories seem to have met with more favor than perhaps any other plan; still, some experienced and comparatively quite successful apiarists are found among the advocates of numerous other methods, most prominent of which are chaff hives on summer stands, double-wall hives, frame hives with deep combs, and box hives or "gums." Yet, in view of the disasters of last winter, it must be admitted that each of the more popular plans so far practiced has proven more or less a disastrous failure, and although much progress has been made in the science of apiculture, in this most important branch no advance has been made.

To account for the many failures of all the popular methods numerous theories have been put forth by the wise ones, while others stand aghast at having had their pet theories proven mere chimeras; and even the most confident look forward with trembling anxiety, scarcely knowing which is the strongest sentiment—hope or fear. Breed our bees up to what standard we may, create a popular demand for honey till it is as eagerly sought after as bread, build up the price till our profits count cent. per cent. when Providence ordains a favorable winter, and yet, with all these, there is a nervous anxiety about the business that is not dispelled till we have passed the last nipping frost of spring. Disguise the fact as we may, until some method for wintering is devised -that is, a method which will prove

all times give bees access to their stores let them be in what part of the hive they may; that will be as safe in a long, inclement winter, such as the last, as they were the winter before; that will carry a colony through on the lowest minimum of honey; that will be cheap of construction and easy of application—until then, the success attending bee-keeping will be more or less a matter of chance.

All the best anicultural authorities of the present day, as well as those who have gone before, give the following as absolute requisites for safe wintering: 1. An even temperature ranging from 42 to 45°, 2. Complete expulsion or absorption of moisture from the body of the hive. 3. Perfect freedom from outward disturbances.

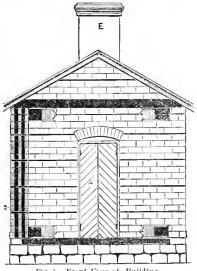

Fig. 1.-Front View of Building,

4. Protection of stores from con tact with frost, 5, Protracted isolation from atmospheric changes in spring. 6. Exclusion of light. 7. Sufficient stores for winter consumption. It is generally admitted that with these seven contingencies provided for, there will be no hazard in wintering, and it is further admitted, that uo plan so far practiced combines all these essentials.

At the recent Northwestern Bee-Keepers' Convention was exhibited a model for a bee house in winter, and dairy house in summer, patented by Mr. W. L. Drake, which may be of interest to bee-keepers, and if it possesses the merits claimed for it by the inventor, is certainly worthy of investigation. The house is constructed of brick, with triple walls. Fig. 1 gives an end view of the house, with door

view of the corner bricks removed, exposing the air-spaces in the wall. The outer air space completely envelopes the middle and inner brick wall, and is intended for a circulating air chamber. The inner space is a dead air chamber, completely enveloping the inner watl, and entirely disconnected from the outer air chamber. E is a flue connecting with the body of the room, for the purpose of drawing off the heat and permitting the escape of noxious gases generated by the bees. It will be observed the flues or dampers connected with the outer or circulating air chamber can be opened or closed at will, to regulate the temperature in the outer space, and this again can be discharged in the main room by means of flues piercing through and independent of the dead air or second space. The floor and ceiling are each double, airtight, and connected with the deadair space. The outer or front door is a double battened door, with an inner or sash door.

Fig. 2 gives a ground plan of a building 12x18 feet, with partition containing air-space, and showing arrange-

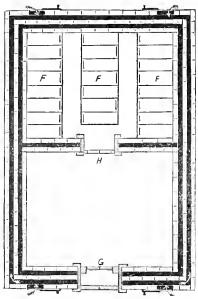

Fig. 2.- Ground Plan of Building,

ment of hives in the rear or bee department, which gives ample room for about 150 colonies in Langstroth hives. The front division can be used for a root and fruit house, or for any desirable purpose requiring a modified and even temperature; it can also be used for a bee repository when they require more room. H is a double-sash door dividing the two apartments.

The inventor claims the following advantages for his building: 1. An even, controllable temperature at any desired point; 2. Complete exclusion of dampness from the room, and absorption of moisture from the bees; 3. Perfect seclusion from outward disturbances; 4. Freedom from atmospheric changes ; 5. Protection of stores from mold or frost; 6. Absolute exclusion of light; 7. Economy in the consumption of winter stores; 8. Avoidance of spring dwindling; 9. A saving in stores and chaff-packing in one season, with 100 colonies of bees. to pay cost of building; 10. A perfect refrigerator and dairy house for summer use; 11. Cheaper construction than an ordinary 12-inch brick, or a stone-wall cellar of same dimensions. | their subscriptions at once.

### Apiary Record Book.

Since publishing the item requesting bee-keepers desiring an apiary record to send in their names, we have received many orders for the book, but each one has suggested some specialty he desired embraced in the book, as, for example, Dr. L. C. Whiting, of East Saginaw, Mich., writes:

I see in the BEE JOURNAL to-day that you are about to get up an apiary record. I want such a book, and I want it so arranged that I can see at a glance the color of the queen, whether dark or light, also whether the bees are quiet or cross.

We have received some valuable hints, and after much study and time spent in getting up a form, think we have one that will suit nearly all. It will devote two pages to each colony, embracing between twenty and thirty headings, neatly ruled and printed, with space at bottom for remarks, and so arranged that a single glance will give a complete history of the colony. Each book will also contain printed rules for the apiary, and twelve pages ruled and printed for an apiary cash account. As each book is intended for a several years' record, it is gotten up on first class paper, and strongly bound in full leather covers. There will be three sizes, sent postpaid, at the following prices:

	100	colonies	(220)	pages)\$1	50
•••	200	colonies	(420	pages) 2	00

Send in your orders at once, and the books will be forwarded as soon as completed.

Binders for 1882.—We have had a lot of Emerson binders made especially for the BEE JOURNAL for 1882. They are lettered in gold on the back. and make a nice and convenient way to preserve the Journal as fast as received. They will be sent post paid by mail for 75 cents. To all who send during this month (December) for the JOURNAL and binder for 1882, we will send both for \$2.50. We do this to encourage all to get the binder and preserve the BEE JOURNAL for reference, and to save us the expense of removing the name from our type mailing machine, and then resetting it in January or February.

Comb Honey.-Mr. G. M. Doolittle, who was awarded the celebrated Thurber "gold medal" in 1877, for the best honey put up in the most marketable shape," will write a series of articles for the Weekly Bee Jour NAL during 1882, on "the production, care and sale of comb honey." Mr. Doolittle is well known to our readers as a practical and successful bee-master, and puts his comb honey up in such excellent style as to command more than the regular market price for it. His articles will be worth much more than the price of the Weekly to any comb honey producer.

🕼 In this number we inclose a blank for all whose subscriptions end with 1881. Fill it up with name, postoffice, county and State, when you remit. If not convenient to send the money now, send us a postal card saying you want the JOURNAL, and it will not be discontinued. We hope all will renew

#### MISCELLANEOUS.

The Profits of Bee-Keeping. - A correspondent of the Ohio Farmer gives his experience as follows :

In 1868 I commenced with Leolony of Italians in an American hive. It was a "raw hand," but liked to work with bees, and one year's experience gave me confidence. That year the 1 increased to 3, and I sold 40 lbs. of honey at 55 cts per lb. The following honey at 55 cts per in. The following year, with the help of an experienced bee man, from whom I bought the bees, I divided and increased to 7, but I only sold \$5 worth of honey. Through mismanagement I lost 3 colonies that winter, and commenced with 4 in the spring of 1870. It was a good year and I increased to 15 colonies, and sold \$65 worth of honey. The next year I sold honey and bees to the amount of \$100 and had 20 colonies left. I 1873 I increased my apiary to left. I 1873 l increased my apart, 40 colonies, all Italians, and sold \$150 worth of honey and bees. In 1874 1 maintained the original number, and sold \$125 worth of honey and bees. For the 6 years the account stands as follows: DEBTOR.

First colony\$ 20,00 52 hives with right 130.00
Γotal\$150.00
CREDIT. By bees and honey sold\$453.00 By 40 colonies at \$10
\$853.00

Balance in favor of bees....\$703.00

Selling Honey to Best Advantage .-Mrs. L. Harrison, in the Prairie Farmer, talks very wisely on this subject. She says:

Some persons are better producers than sellers of their productions. Our success as apiarists depends, in a large degree, upon our ability to dispose of the product at paying rates. If we are amateur bee-keepers or farmers, and have but little to sell, we should endeavor to get a fair price for what we do, knowing that if we take a low price for what we have a low price for what we have it have the product the leave it has a low price for what we have it have the product the leave it has a low price for what we have it have the price in the product of the price for what we have, it may wrong another person who depends for his livelihood upon this "business," always remembering,

To do unto others, as you would That they should do to you, What e'er is honest, just and good, With all your might pursue."

An article to sell well should please An article to sen well should be the eye, and if for food, should be toothsome and agreeable to the palate. To meet the demand of large cities, comb honey should be stored in small sections, weighing from 1 to 2 pounds.

Some apiarists insist that these should be glassed. We have read in

history that Cleopatra dissolved pearls and drank them, but we have never known of any one using glass as victuals and drink.

When you have a good article and know that there is no mouse hidden in the meal, such as glucose, etc., and can then look a person in the eye without tlinching, you are in the right condition to demand a good price and get it too; and the next season the buyer will seek for you, instead of your hunting for him. Extracted honey put up in glass jars and tumblers is too dead to bury—glass jars was the murderer. A farmer's wife came into the grange store in this city with into the grange store in this city with several gallons of extracted honey for sale. A number of persons were in the store at the time, and judging the lady to be honest, immediately purchased all her honey; while at the same time there were jars and tumblers, labelled honey in attractive form, that had become old settlers. We know a farmer who lives 5 miles from any town, and has an apiary of 50 col-

onies which he runs exclusively for extracted honey, and is not able to supply the home demand.

Honey as Food.—The Michigan Farmer advises the daily use of honey, on account of its beneficial effect on health. It says:

We desire to commend its daily to every family in the land. We believe it to be one of the most healthful sweets that can be found, and well adapted to common use. It seems to us very desirable that Michigan should produce a large share of her own table sweets. Could honey be brought into general use, thereby creating an extensive home market for it, we believe it would tend to encourage the culture and production of honey enture and production of honey. Prof. Cook, our own State apiarist, of whom we are so proud, says Michigan is naturally adapted to the production of honey. Let Michigan people use it—put it on the table every day. It is a healthy sweet for children, and children must have sweets just as the Irishman must have potatoes. honey bee feeds upon the healthy juices of healthy plants, and honey must partake of the quality of the blossoms of the plants and trees from which it is gathered. The use of this article should become so common and armoved that a barry close or the plants are the should become so common and armoved that a barry close or these trees are the statements. general that a honey store or depot would be found profitable in every large town. We believe in encourag-ing the bee-men and women, and if nig the bee-men and women, and if every family in the land would make honey an article of daily use, in place of the unhealthy syrups, then all con-cerned would be benefited.

The Poppy and the Bee.-The following amusing dialogue illustrates the advantage of bees to flowers. It is from an exchange:

A wild bee, which had flown far without having breakfasted, at length entered a garden, the first he had seen.
"What a Paradise!" he exclaimed.

The first thing that attracted his attention was a full-blown poppy; but, accustomed only to mint, wild thyme and such like fare, he approached the gaudy beauty with some diffidence.
"A little pollen please" he at

"A little pollen, please," he at length ventured to say, in the humblest manner

"Be off! be off!" was the ill-natured

The poor bee was almost fainting with hunger and fatigue, and asked leave to rest himself for a little. "Be off!" returned the haughty flower; "I don't encourage idle yag-

rants like you. Stay at home, and you will not have to complain of being tired; sit upon your own stalk, and you won't have to support yourself by begging. Be off."

begging. Be off."

Did the silly poppy imagine that butterflies, bees and such-like ereatures, were nothing else than wander ing blossoms? Howeverthis may be was overheard one day talking to itself after this fashion:
"What is a flower born for, I should

like to know, but to see and be seen and admired? These pansies, with all their pretensions, are such a set of flats! so low-born and ill-bred!"

With the gardener, the great judge of plants and the arbiter of their fortunes, the pansies were especial favorites; and he took great pains and no small pleasure in rearing them.

It so happened that he passed just as the poppy was exclaiming her last be off!" and scornfully shaking her glowing petals after the retreating

Looking angrily at the flower, he said: "What is sweeter than honey? and how should we have honey withont bees? and how should bees live if all flowers were as vain and empty-headed as you?"

So saying, he plucked it up by the root and threw it over the garden

wall.

### Pollen-Its Relation to Dysentery.

F. DELLA TORRE.

From certain inquiries recently received, it appears that my few remarks at the National Convention at Lexington were not altogether understood. With permission, I will reply through

the BEE JOURNAL

I stated that pollen (pure) was not the cause of dysentery; that so far as is known, bees have been wintering on combs containing pollen since the creation, in hollow trees, with very good results, and that "bacteria" was only theory, proved so by me from many xperiments, among which I will mention one easily understood, viz : I tried to inoculate healthy colonies by removing all their stores and replacing (in mid-winter) with combs from colonies in the worst stages of dysentery; instead of contracting the disease, they cleaned up the dirty combs, so that none but an expert, by noticing the wood-work of the frame, could tell they had ever been affected. I stated, I believe, that I knew the one and only direct cause of dysentery, proved be-yond doubt or question, by actual experiments, at all seasons of the year, and for three consecutive years.

This sounds "very large" for one man's share of new discovery, if it were such, but it is not, we have all known the fact for years, without giving it the importance that it merits; but I do claim the right to bring this before my fellow-apiarists, and to com-pel their attention in any way I can to the importance of an exact understanding of these facts.

The amount of pollen digested by adult bees is practically nothing, and under the most favorable conditions. no matter what amount be eaten, it will all be voided as a dry dust; if the conditions are unfavorable, dysentery is the result. These are both stateis the result. These are both statements which all admit, and say, as a logical consequence, that pollen is the cause of dysentery, and "that settles it." Let me draw a comparison, clumsy though it be; it may serve to convey my meaning: If it were not for gunpowder, bullets would be very harmless for the purpose of destroying life. If it were not for more than the purpose of destroying before the purpose of destroying the content of the purpose of the life; if it were not for moisture, pollen would not only not produce death (like the bullets mentioned above), but from it would spring life itself, in fulfilment of the God-given mandate, "increase and multiply." Why is it, then, that pollen, ever ready to produce life, should be accused of defeating the very object for which it is created, when the whole fault is our own, because we choose to draw wrong con-clusions?

If I could only convince the frater-nity of the importance of ever keep-ing this word "moisture" constantly before them, whether in debate or in the apiary, it will prove for itself bet-ter than I can, that it is the cause of dysentery, and an ever-present cause. for wherever there is a cluster of bees there you will find this subtle enemy to bee-life being produced.

Again, if it was pollen that produced dysentery, would not all bees die that have any in their hives in winter? I do not call a colony in normal condido not call a colony in normal constraint in in this State, unless it has several pounds of pollen at this date. When pollen is covered with honey it will remain unchanged for a long period; but when exposed to damp air it, like all other organic matter, decomposes in plain English, rots.

Fresh, sound vegetables and fruits are healthy for people, and fresh, sound pollen is harmless for bees, if they choose to eat it. Rotten fruit or pollen, if persisted in, will cause sickness and death to both of the above objects. This is not an abstruse subject (I wish it was), but it is so simple that

it foils one's attempt at a Incid expla-

Oettl's golden rule is without a rival OctH's golden rule is without a rival for summer, but it should be supplemented for winter to read, "Keep you pollen dry." To do this your hive must be dry, and to effect this desirable object mere mechanical absorbents, chaff, sawdust, leaves, etc., will not do, for if the air outside is damp, that in the hive is more so. Then it that in the hive is more so. Then it is that the pollen absorbs moisture and rots, giving off sulphuretted hydrogen gas, which is poison to bee life, besides the very offensive odor which makes them restless that this gas has, is the first indication of dysentery. We must use chemical absorbents. The cheapest is a quick-lime cushion divi sion-board, and that is the whole story then if you want any dysentery to ex-periment with you must do as I have

Baltimore Co., Md., Nov. 22, 1881.

For the American Bee Journal,

### Experiments in Feeding Bees.

WM. STOLLEY.

Since Sept. 29, I have attempted an experiment with my bees to which I was led, partly by my good success in wintering them safely last season (nearly exclusively on syrups of coffee A sugar), and partly because several correspondents of the AMERICAN BEE JOURNAL have suggested to take from the bees all their natural stores from the bees an their natural stores (in particular the pollen), and feed coffee A sugar syrup instead. To be as safe as possible in prosecuting my plan, and be ready at short notice to ont my bees in proper condition to go into winter quarters, I proceeded in the following manner:

the following manner:

On Oct. 18, I extracted all frames filled with partly unsealed honey, and those containing the most of pollen, but leaving in each hive 5 frames containing the most of sealed honey and the least of pollen. After extracting, I selected the choicest of the goal and with least in the genter. the comb and put back in the center of the brood chamber for each colony according to strength, 2 or 3 frames thus emptied only, and contracted the space by division or chaff boards. Thus arranged, I allowed my bees to partake of the honey adhering to the extracted comb, as well as to suck all the cappings dry. After they got through with it, I commenced to feed through with 1, 1 commenced to feed the sugar syrup out of large feeders made out of  $11_2$  inch thick planks. from 8 to 12 inches wide, and about 2 feet long. About 10 of them were prepared with grooves  $1_2$  inch wide and probably  $3_1$  inch deep. Thus 1 could feed about 2 gallons at one fill-

All the feeding was done outside the hive near my bee house, but out of sight of their hive. Since I have no strange bees to contend with, I thought strange bees to contend with, I thought this the quickest and best way, and can say it worked to my entire satisfaction, and but very little fighting among the bees took place, since there always was plenty of food for all the busy workers. According to the prevailing more or less suitable weather for the bees to work, I fed respectively per day, 15, 20, 25, 40 and 30 lbs. of coffee A sugar; total, 155 lbs, in 6 days. Adding about the same weight of water, constituting the syrup fed, the bees carried into their hives fully 310 lbs, in 6 days, not counting what 310 lbs. in 6 days, not counting what honey they got from the extracted comb and the cappings fed to them.

After feeding the mentioned quan-

tity of sugar syrup, I weighed each hive again as I also had weighed be-fore feeding. The result was that all colonies combined had gained but 127 lbs. net.; hence, there was an actual loss of 28 lbs., even of the dry sugar fed, besides the water fed with the sugar. Fearing that cold weather might set in before I could complete and thus test the matter as to wintering bees on coffee A sugar exclusively. I concluded to stop feeding, and arranged my 14 colonies on Oct. 26, by leaving from 20 to 28 lbs. of sealed winter stores in each hive according to strength of each colony.

I contracted the space inside the hive to from 6 to 8 frames ; put a hole of an inch through the comb. 2 mehes below top bar, and after laying 2 cross-pieces over the middle of the top-bars, thus making 2 winter passiges clear over and through the comb t put on the clean woolen quilts, filled the supers with bags of loose texture filled with wheat chaff and straw, Thus prepared, they will be moved within a few days now from the front of my bee house to the back wall, and packed in the same manner as last winter. Vactories we had a few days now had a few days now had a few days and packed in the same manner as last winter. winter. Yesterday we had, after quite a severe cold, a very warm day,

quite a severe cold, a very warm day, so that the bees had a good flight, while this morning at sunrise the mercury indicated 18 F.

Commencing the season with 6 colonies, I now have 14, and took from them 230 lbs. of extracted honey, which is all spoken for at 25 cts. per by Mylags have a total of 353 lbs of winch is an spoken for at 25 cts, per lb. My bees have a total of 353 lbs, of well-sealed winter stores, of which 155 lbs, is coffee A sugar syrup, and 198 (bs. of honey. Whether they will winter as well as last winter remains

Grand Island, Neb., Nov. 17, 1881.

For the American Bee Journal.

### Transferring Bees.

A. B. MCLAVY.

I have watched with no little interest the proceedings of bee-keepers' conventions this fall, for a practical and concise essay on the transferring of bees. I do not think that it has reof bees. I do not think that it has re-ceived the attention it deserves, as it is the first step in improvement of manipulation of bees. Whilst it is true that no special skill to accom-plish it after it is understood, is re-quired, yet the "modus operandi" is a stumiding block to many. I do not a stumbling block to many. I do not seek to impart knowledge, but to gather it in my study of bees, and whilst the directions given below are, as far as I know, original with me, any improvement is suggested. I will gladly adopt it. I have tried almost all the ways already suggested. I have found none that operate as satis-

factorily.

If the bees are already where you wish them to remain, well and good. If to be moved from another locality, we will select a place where we wish them to remain. Now we use the Langstroth hive with a movable bottom described as the selection of to board; supposing others do also, we will say in the first instance, slip the bottom board under the old hive, with the front of the hive and the opening for ingress and egress on the front edge of the board, and place arms eliciting board heard with the control of the power wish. your alighting board just as you wish it to remain, often transferring. The same directions apply to those which you have brought home. If you intend using a painted hive, now paint the old hive just the same color the the old hive just the same color the new one will be, and do not disturb the bees any more for 2 or 3 days. In that time they will have gotten used to the new order of things, especially to the new order or unuse, copound the bottom and alighting boards. Now, supposing the day is pleasant. we will proceed to transfer. get our new hive in readiness, and place it with a frame of brood (from another colony) therein on the bottom beard where the old box hive stood, and put the cover on. Now on a sheet beard where the old box tive stood, and put the coveron. Now on a sheet folded once, we will lay the old hive on the ground, say 30 or 40 feet from the place where it stood. If the sun is warm, we get under some tree which is at a convenient distance. Do not lay the hive so that the combs will fall together, but if possible, lay it so that they will stand perpendicular; if they fall together, you may kill a number of bees or your queen. Now a number of bees or your queen with a hatchet or chisel and a billet of wood, cut the nails so as to remove one side of the hive, and with a long one side of the five, and with a long knife sever the combs so as to lift it off without tearing them. Now remove, as far as practicable, all the ragged pieces of comb, and if containing

you; if straight, with a guage stick the depth of your frame, remove therein pieces so as to fit your frames. If they contain honey and are nice, lay them between folds of carpets or blankets, in fact, any kind of cloths so as to keep them nice.

The brood chamber now occupies our attention, here it is, from the eggs to hatching bees. Now with your gauge stick, try to get them so as to fit your frames as nearly as possible, always cutting them to "the best advantage," that is, so as to get as large and as straight combs as you can. as is likely to be the case, the brood is as is likely to be the case, the broad is both above and below the "cross sticks," make them your guide for cutting, removing the broad combs and laying them between fold of cloth or something of that kind, but not top of each other unless separated by folds of cloth, until all is removed. You have probably before this removed the side of the hive nearest you, so as to get it out of your way. There is now honey comb and bees in the hive—the bees have retreated as you have advanced, and are now likely hanging in the far corner of your hive like bees at swarming time, and the queen is with them and the cluster is probably made up of young bees. are now to remove the combs yet remaining expeditiously, taking care of the nice combs as before directed, and the scraps are to go to the pan. on a previously prepared pad, made by several folds of cotton cloth stretched and tacked on a board of convenient size, stretch 3 or 4 cotton strings cut long enough to go around your frame and tie; lay your brood comb on this, and, having removed the comb-guide from your frame, cut the comb so as to fit the frame nicely, having an eye to keeping the brood as near the center of the frame as possi-ble, cut the drone comb off entirely, and sacrifice the honey for the brood as fast as you fit the combs in the frames, take them to the hive and put them in, where you shall have 3 or 4 in the hive with the brood opposite each other so as to keep the cluster together, get the old hive now, and take it to the front of the new hive and brush the cluster off; if you watch carefully you will soon see the queen—aid her to find her hive, and you will experience—the—pleasure of having transferred successfully.

If the honey combs remaining are nice and straight, cut them in like manner to fit your frames and hang them in your hive, if not, supply them with foundation. It you wish to give them the beauty had a your will year. with foundation. If you wish to give them the honey back as you will, very likely, and do not wish to be bothered much with it, we will nail thin strips of wood together by making a grate, we will call it, to fit in the second story, and let its four corners rest on four cleats tacked in the second story. and uncap the honey and lay it in this grate. Now turn one edge of the mat back and the bees will go to work to carrying it down.

The point in this mode is this: I find no use for smoke; the operation being performed away from the stand, bees from other hives are not attracted to it. You do not daub the new hive so as to induce robbing. The bees not being intoxicated with smoke repel all bees which are inclined to rob. You are not bothered with the flying bees as they instinctively seek the stand and cluster on the one comb you had prepared for them, and if you choose, the operation can be performed so quickly that robber bees have not the time to make more than one or two trips before you are done; The point in this mode is this: one or two trips before you are done; and lastly, but not least, your bees are now in their new quarters—none the worse for wear, as will be attested if you notice, by their bringing out the scraps in less than an hour, and frequently before you have put the top on preparatory to leaving them to the westless. themselves.

In a few days (2 or 3) examine the

move, as mars practicable, an the ragged pieces of comb, and if containing honey, put them in a pan, which keep covered.

You have now gotten to combs which are likely to be of service to the hive and carefully remove them.

If you should be nervous or fear robbing whilst transferring, make a smoke to your windward so that it

smoke to your windward so that it will pass over the open air.

And now, one word of caution, just here, to the novice: we will say that our judgment dictates feeding back the honey, especially if it is done at a time when there is none coming in. When you have fed back all your honey (which I think ought to be fed intervals), you will find that your at intervals), you will find that your queen has been doing her best to breed up, and as a consequence, she is and will be depleting her stores. Guard against this by after feeding, and see that they do not want, for she will that they do not want, for she will yery likely have a large family on her

hands.

I will remark that this plan has worked so well with me that really, when it is through, you feel like there is something else yet to come, but you and a product it is. You look at your wonder what it is. You look at your wonder what it is. I on look at your hive—you see no robbing, and if there is anything to work on, you will see the bees go and come with so little excitement about their home, that it really seems that nothing has happened.

From Western Stock Journal and Farmer.

#### Report on Bees-1881.

O. CLUTE.

I began the season with 30 colonies which had survived the fearful winter, but were by no means strong. Most of these were Italians, having queens grown the previous year from an imported mother bought of Mr. Dadant.

orted mother bought of Mr. Dadant.

My hive is the Simplicity. All
hives are exactly alike. Hives are so
made that one can be set on top of
another, so as to make a hive two or
more stories high. My frame is the
Gallup, just 11<sup>1</sup>4 inches square.

Believing that it would be more
profitable to increase my bees than to
get surplus honey this year. I ulanned

get surplus honey this year, I planned the season's work mainly with this view, expecting to get only so much honey as could be secured while mak-

ing a large increase.
In order to secure straight worker combs, and to save the time and honey consumed by the bees in making wax. I used nearly 200 lbs. of comb founda-

An attempt was made to preventall natural swarming. It was not entirely successful, for 3 colonies issued, one of which left for parts unknown. In making my increase. I practiced the nucleus system of swarming.

It was my purpose to increase in such a way as to have about doubled soon after white clover should open; then, if possible, keep them at work without any attempt at further increase of colonies until after linder and white clover were gone; then and white clover were gone; then and white clover were gone; then again to double the number and get all in as good condition as possible to gather the fall harvest. I was able to do a little better than I had planned.

Because it seemed easier when I was working for increase of colonies, to get my surplus in the shape of extracted honey rather than comb boney, I determined to make noeffort for comb boney, but depend entirely on extracting for my surplus.

This year "winter lingered long in the lan of spring." Great snow banks

the lap of spring." Great snow banks were on my lawn mtil April 10. April 15, the bees, which for more than 5 months had been in the cellar, were 5 months had been in the cellar, were set out. April 17, they began to bring in pollen. At a single bound the weather passed from winter to summer. The last half of April and all of May the weather was warm and clear. There was hardly a day on which the bees could not fly. The spring bloom was profuse. Willows, elms, maples, cotton-woods, blox-elders, cherries, apples and raspherries opened in rapid succession, and gave sufficient honey and pollen to keep up brood-rearing and to allow a little to brood-rearing and to allow a little to

yielded honey only moderately. no time during the season did it yield so largely as is sometimes reported. Linden gave an abundance of bloom and it seemed to yield honey, but several rainy and windy days kept the bees in the hives, and washed the honey from the bloom. It yielded but a moderate surplus. White clover a moderate surplus. White clover continued to yield in small quantities after linden was gone, the season seeming to be prolonged by copious rains. After the middle of July the months became him that the grantle weather became dry, but the ground was so saturated that the clover con-tinued to bloom for some time. The tinued to bloom for some time. The dry weather was severe and long-continued. Very little rain fell for 6 weeks. I had expected that there weeks. I had expected that the would be scarcely any fall bloom, and no fall honey worth mentioning. But the reverse was the case. We had a the reverse was the case. We had a heavy flood in the lowa river about July 12. The water swept everything before it. The bottom lands were cleaned of all crops and weeds. Then before it. The bottom lands were cleaned of all crops and weeds. Then heartsease grew up in great profusion. There were many acres of it. It be-gan to yield soon after white clover gan to yield soon after white clover ceased. The flow from it was not very copious, but it was steady. Frosts held off for full a month longer than usual, and during this added month the days were mostly clear and warm. From the 30 colonies I increased to

140. I took 2,500 lbs. of honey, nearly all extracted. The honey is selling at 15 cents a pound. The crop is worth \$375. The bees are worth \$8 a colony, \$375. The bees are worth \$8 a colony, making the 110 colonies of increase worth \$880. Total, \$1,255. My expenses for hives, frames, foundation, paint, labor and sundries were \$305, giving a net gain of \$950. My bees in the spring were worth \$10 a colony, or \$300 for the 30 colonies. The gain has therefore been 316 per cent. But the winter is yet to come, and it is the winter is yet to come, and it is quite possible that it may bring dire disaster to my "blessed bees." In the spring I will report my method of wintering, and its success or failure.
Iowa City, Iowa, Dec. 1, 1881.

For the American Bee Journal.

### Our Bee and Honey Report for 1881.

L. C. ROOT & BRO.

In giving the results of our present season's operations we desire to say, first, that such results could only be attained under very favorable circumstances. Such reports without explanation may easily lead the uninformed to engage in the business expecting similar results at once. Bee-keeping, like all other pursuits, must be made a study, and it can only become a success by close application.

We commenced in the spring with 160 colonies, most of them in good condition. As is generally known, the early spring was very unfavorable for all operations with bees; in fact, we have never, with one exception, seen

a more discouraging outlook.

During fruit bloom the weather was very favorable, and from that time everything was musually so.

Our bees were located in 4 places, 40 colonies in each; one apiary 7 miles north, one 4 miles south, and one 7 miles southeast. Upon this point of locating bees, the number of colonies that should be kept in one place, etc., an entire article might be prepared. By the adding of combs at proper tmes and by thorough attention.

colonies became extremely populous.

If space would allow, we might consider a question at this time which is

of extreme importance to every beekeeper, namely, that of increase.

We will simply say that with us there have been two seasons during the past 10 years, when our stock might have been doubled and at the same time more surplus have been secured than to hold all of the force to the original colonies. With the unthe original colonies. certainty of a continued yield of honey, we find that we must be in readiness to secure honey rapidly dubrood-rearing and to allow a little to certainty of a continued yield of the wholesaler may do as well by dash the commission man. But, as Mr. had ceased but a short time before the earliest white clover was open. Soon the fields were covered with its starry carpet of green and white, but it our location, very moderate if any in-

crease is preferable; we have therefore made no increase. When extracted honey is secured, swarming is easily controlled. We do not advise the entire prevention of increase, for the average bee-keeper. Probably most beginners will succeed best with a moderate increase, but we advise that it be limited to at most one colony from each good colony even in best seasons.

Let us say that the combs we had

packed away which contained the honey gathered late in the fall pre-vious, proved of great value. A nice comb containing 3 to 5 pounds of honey with the cappings broken by rubbing a knife over it and then placed in the center of a strong colony, would be rapidly emptied, and the cells would be readily occupied by the

By June 1, clover and raspberries afforded honey bountifully; in fact, we have never known clover to yield anorued noney bountifulty; in fact, we have never known clover to yield so much honey. We extracted our first honey to any extent June 28. We will give the results of our best apiary: June 28, 1,500 lbs.; July 9, 2,575 lbs.; 16,2,000 lbs.; 25,26,3,140 lbs.; late honey, 512 lbs. Total, 9,727 lbs.

From one colony of best Italian bees at our home apiary, we took as follows: June 25, 96 lbs.; July 4, 62½ lbs.; July 8, 114 lbs.; July 12, 66 lbs.; July 19, 40½ lbs.; July 22, 36 lbs.; Aug. 5, 42 lbs.; Aug. 27, 27 lbs. Total, 484 lbs. June 26, this colony gathered ways 20 neounly during the day. July lbs. June 26, this colony gathered over 20 pounds during the day. July 10, the hive was weighed at intervals during the day, showing results as follows: At 1 p. m. 155 lbs.; at 4 p. m. 160 lbs.; at 5 p. m. 163 lbs.; at 6 p. m. 166 lbs.; at 7 p. m. 171½ lbs.

Our entire yield from the four apiaries was 32,800 lbs. With one extractor we took in one day 2,760 lbs. This we believe to be the largest amount of honey ever taken in one day with

of honey ever taken in one day with one extractor.

Our fall yield of honey was almost entirely cut off by the extreme drouth. entirely cut off by the extreme drouth. We have never secured a finer quality of honey than during the present season. Our bees, as well as bees in general, go into winter quarters in very good condition. On Nov. 17, they had a free flight. We placed them in winter quarters on Nov. 21 and 22, which practically closes the season of 1881 season of 1881.

We give this report to induce a more We give this report to induce a more thorough examination of the best methods of bee-keeping; the advantages for so doing may be found on every hand. Besides the bee periodicals devoted exclusively to this interest, every agricultural paper of note in the land has its bee-keeping department, noting the various operations of advanced by a cultural paper of the partial of the paper rations of advanced bee-culture.

It is a matter of greatest surprise to ns that, with these opportunities which may be so easily taken advantage of, so many may be found who are yet contented to keep bees in box ives and in the old way. Mohawk, N. Y., Nov. 25, 1881.

For the American Bee Journal.

### The Disposal of Honey.

JAMES HEDDON.

I wish to say to Mr. Geo. W. Honse, that I still believe I am right in saying that buyers are "bears," and commission men "bulls," Dealers like mission men builts. Dealers like low prices, because it increases sales, commission men desire to sell our goods at high prices, because it satis-ties us better, and insures to them our consignments, thus increasing their sales. The bee-keeper spoken of by Mr. House on page 380, should have limited the selling power of that firm to stipulated prices, and if they would not be limited, it would have shown they were not the right firm. If ever the demand for honey becomes staple (which I still am in doubt shout) there which I still am in doubt about), then the wholesaler may do as well by us as the commission man. But, as Mr. House aptly says, "Facts are of great

in Chicago-houses offering to bny a commodity that had no fixed and regular price. They bought the honey of the inexperienced, but finally we found that the commission houses could and that the commission houses could and did sell to them and others for 20 to 40 per cent, more than they would offer us, and consequently the commission men have the trade to-day. It is no infrequent thing to find these commission men selling odd lots for these buyers. So much for comb honey.

How about extracted? Commission men handle this hut little in Chicago.

How about extracted? Commission men handle this but little in Chicago. Buyers have control of this style of bee product. Look at the prices. bee product. Look at the prices. Comb honey 20(a 22c.; extracted honey 9c. We have been told that extracted honey was really worth the most; was all pure honey—no indigestible wax to swallow. How long is it going to take consumers to find this out?

Does it not seem to argue that if honey is a staple, or anything like it, comb honey is really worth more than twice as much as extracted? If it is not, then honey is nowhere near a staple with Home is it which war about ple yet. How is it—which way shall we have it? Or is it that one being in the hands of commission men, and the other in the hands of buyers, makes

all this difference?
With the use of our best comb fourdation, I feel surethere is no such dif-ference in the cost of production, and

if in this I should be mistaken, and cost of production should be urged as cost of prometion should be firged as the argument, then it follows that the demand is below the supply, for such a state of things gives all the favors to the consumer. If the benefits aris-ing from the invention of the honey extractor are all in the hands of the consumer, then it must be that demand does not keep up with the supply, or that the product is being badly handled, or something is wrong, somewhere. Where is it—in my reasoning, or where? Why not tell us now? or where?

Bees are tlying lively to-day (a month or more later than last season), and 40 or more later than last season), and 40 colonies put into cellar a week ago are still as death. If this winter continues with its present characteristics, will not cellars get into disrepute again?

Dowagiac, Mich., Nov. 30, 1881

[Our correspondent evidently labors under a misapprehension of the meaning of the word "staple." Webster defines it:

2. Established in commerce; settled; as a stale trade.
3. According to the laws of commerce; fit to be 3. According to the laws of commerce; fit to be sold.
4. Regularly produced or made for market; chief; principal; as staple commodities.

It is used with the same signification in commercial parlance. It does not follow that the price for different grades should be uniform, or even proportionate one to the other; if honey commands a ready sale, and is quoted in the price-lists as marketable, it has become a staple, even though one kind or grade brings triple the price of another. That commission men handle one kind and jobbers another, makes it none the less a staple.

In regard to uniformity in price, one with another, we find honey is no exception to the general rules of commerce. There is also less variation in figures, taken one city with another, than in almost any staple article.

That there is an unjust difference in the prices of comb and extracted honey may be true; it may be equally true that, reckoning failures with successes, comb honey costs more than double as much as extracted, by the that is, take the total production, additional freight charges and destruction in handling, combined with its lesser production, might make the

than our correspondent) is the preindice which exists in the popular mind regarding everything purporting to be extracted honey. In view of this fact, the Bee Journal has been persistent in its advice to build up home markets, where the integrity of the producer would be a guaranty of the purity of the product.

From a hygienic standpoint, extracted honey is "really worth the most," from a commercial view, it is not; but we are convinced if the infamous traffic in glucose and other adulterants was stopped, except under their proper names, extracted honey would be at least an equal favorite with the comb, at equally as good figures.—ED.]

### Translated from "Bienen Vater." Items of Interest from Germany.

BY A. R. KORNKE.

Extract Only Capped Honey.—Mr. Brun, a bee-keeper, sold to a man some newly extracted honey. After a few days the man called again bearing a certificate from a chemist containing a statement of the results of an analysis of the honey to the effect that though the honey was otherwise pure it had been largely diluted with water. it had been largely diluted with water. This had, of course, not been the case, but the honey had been extracted before being capped. To convince his man of the purity of his honey he took him out to the apiary, extracted some of the same kind and quality, which was as thin as that the man got before. The man, after obtaining such ocular proof of the purity of the honey, apologized for his conduct, for he not only demanded the return of his money but threatened to expose Mr. B. as a fraud; but instead of that Mr. B. as a fraud; but instead of that he now bought more honey of the same kind, being well satisfied with it. But Mr. B., the bee-keeper, was not, for Mr. B., the bee-keeper, was not, for he could not help but admit for *good* honey it was *too thin*. So he sent some to another chemist to have it analyzed. The verdict returned was, honey pure but too thin; spec. gr. 1.39, which for good honey should be at least 1.42, but generally is 1.45. Moral: Extract only capped honey.

The Secretion of Nectar by Honey Plants.—How often do we hear the complaint: "The clover, or buck-wheat, or basswood was in full bloom, but did not seem to yield any honey." It is of the utmost importance for every bec-keeper to know why many honey plants under apparently very favorable conditions yield no nectar. To discover the cause, and if possible solve the problem, I have made experiments for several years in this direction. Two years ago, it was about the time of the rape and white clover bloom, which always furnished a bountiful harvest for the bees, that cold rainy weather set in, so that the bees were not able to gather sufficient winter stores, which would have been the case if the weather had been more favorable. To furnish the bees a substitute I sowed 12 acres in buckwheat, stitute I sowed 12 acres in buckwheat, but without manuring. At the beginning of August the buckwheat looked beautiful, promising a good harvest of honey, but uo bees went after it, nevertheless the weather was all it could be wished for. The yield of grain of this buckwheat, when threshed, was very poor indeed. Sending a sample of the soil of that field to a chemist to have it analyzed I was told that the buckwheat could not told that the buckwheat could not possibly yield any better because the soil lacked in nitrogen, etc., but especially in lime. This led me to suppose that, inasmuch as every plant needs a certain per cent. of nitrogen, lime, etc., to grow to perfection, lime may play an important part in the se-cretion of nectar by enabling the plant to assimilate the constituents of sugar to assimilate the constituents of sugar from soil and atmosphere more readily. Acting upon this supposition I have found that plants yielding nectar at all would do so in a much larger time and place of future meetings.—ED.

degree if planted or sown in a field which previously had been manured with lime or plaster, and in case the weather was favorable yielded a most bountiful supply of honey. Some may rejoin that buckwheat yields the most honey on a poor, stony or gravelly soil. That is quite natural, for such soil. That is quite natural, for such soil contains the minerals, viz: lime, feldspar, nica, etc., in abundance, and as buckwheat uses more of that than nitrogen such fields are in the best possible condition to support honey yielding plants. Most commonly occur lime-feldspar and mica, those undergaing a process of decomposition. these undergoing a process of decomposition, the result of which is carbonate of lime, but as all soil contains sulphates this carbonate of lime in the process of the carbonate of lime in the process of the carbonate of lime in the process of the carbonate of lime in the process of the carbonate of lime in the process of the carbonate of lime in the process of the carbonate of lime in the process of the carbonate of lime in the process of the carbonate of the c is changed into sulphate of lime, which, being very soluble, is easily assimilated by plants. Now, if a bee-keeper intends to sow to furnish his bees forage he must be sure that his field contains a liberal supply of lime; if not present in natural sources he must farnish it artificially by plaster-ing. White or any kind of clover serves as a very good illustration and proof. If clover is plastered it grows most luxuriautly; if not even then it proof. will yield honey very often. Because clover is a deep-rooted plant, sending its roots down several feet to obtain what it cannot find at the surface.

Mr. H. has been cured of a severe attack of rheumatism by B. Schindl-mair. Treasurer of the Vienna Bee-Keepers' Association, by the application of bee stings. On the first day he had him stung in the affected parts by 8 bees, on the second by 6, after which the man was soon relieved.

Last summer a swarm of bees settled in the rattines of the man-of-war "Frederick Karl," stationed at Kiel harbor. Sailors tried to drive them away by pouring whisky on them; this of course enraged the bees to such a degree that they forced the sailors to leave. A bee-keeper was then sent for; he being absent, his wife, Mrs. Andresen, went on board the ship, hived the swarm and took it ashore. It has been doing well since.

The question drawer of the Bee-Keepers' Association of Thuringia and surrounding countries, at a meeting contained the question:
"What is the experience with the American honey rack?" Mr. Lampe American noney rack? Mr. Lampe said he could not recommend it. Mr. Herrmann, who has introduced the use of it in Germany, obtaining his rack of Mr. Newman, of Chicago, on his late visit to Germany, with some prize sections, said that his honey racks, on exposition, proved that beekeepers in Germany are just as likely to obtain line honey in prize sections as they do in America, and as much of it, if they only learn to be practical. -Deutscher Lienenfreund.

[There is evidently a screw loose somewhere; too much theory and not enough of practical application.-TRANSLATOR.]

### Utah Convention.

Met at Salt Lake, Utah, Oct. 5, ISSI. The minutes of the previous meeting read and approved. Reports for the last six months were called for from the various counties and responded as follows:

Salt Lake county reported 2,366 colonies of bees in good condition, with the exception of considerable foul brood throughout the country. The county court has appointed but one bee inspector, and the amount of work assigned that officer has proven to be

assigned that officer has proven to be too much for one to accomplish. 118,:300 lbs. of honey reported.

Spanish Fork, Utah County, has 515 colonies in good condition. Some foul brood has been destroyed by birming hives and contents, and at present the vicinity is about free from the disastrous pest. The amount of honey produced this last senson is 33,036 lbs., being an average of over 60 lbs. to the hive; and at 12½ ets. per lb. wholesale, would be a revenue to that settlement of \$4,133,25. Charles Monkis tlement of \$4,133.25. Charles Monk is

President.
Payson, Utah County, reports 604 colonies of bees, and 31,215 lbs. of honey. Bees are in good condition, except some foul brood. Parley M.

Driggs, President.
Pleasant Grove, Utah County, has 463 colonies of bees, and Lehi, Utah County, has 200.

Gunnison, San Pete County, has 20 colonies of bees and has taken 1,000

lbs. of honey.

Manti, San Pete County, was repres-

ented by Win. Braithwaite, County inspector, who said they had 700 colonies of bees. When he inspected the county he found some foul brood, and destroyed about 30 hives by burning they be the bear with the county he found some found broods. or burying them. His bees will yield from 75 to 90 lbs. of honey per hive.

Cedar City, Iron County, represented by Richard R. Braithwaite, has 210 colonies of bees. No foul brood there, but the hot and dry weather has been against their honey harvest this year.

Cache County was represented by

Cache County was represented by George Millard, of Logan, County inspector. There are 153 colonies of bees averaging 50 lbs. of honey to the colony, or 7,650 lbs. total. The frosts of May and June operated against the bee interests, so that July 1, the workers killed off the drones; however, after that date the bees did very well. Tooele County was represented by T. W. Lee, Secretary of the Tooele Association, who says the bees are doing well. They have 130 colonies of bees and no foul brood.

Jesse Murphy reported his bees

of bees and no four brood.

Jesse Murphy reported his bees
doing well and having no foul brood. He had about 95 colonies of his own, and had taken care of some for his neighbors. He had taken 7,000 lbs. of and facel care of some for his neighbors. He had taken 7,000 lbs, of honey and had yet got to take 800 lbs, more and had made 100 lbs, of beeswax. He had made a wax extractor galvanized sheet iron lined with tin, and a glass frame over the top. The box was made flaring at the top and a wire screen placed below the center for the comb and cappings to rest upon. The hot rays of the sun caused the waste honey to run off through a tube in the bottom of the through a tube in the bottom of the box and the wax settled on the hot-tom very clear. He would melt the dross remaining in a kettle skimming it well. French white glass in large panes was best for the top of the box. It cost him about \$5. Henry Tempect, of Herriman, said

he had about 6 colonies of bees, and

was well pleased with his experience.
David Sabin, of Payson, began 7
years ago with 6 colonies of bees,
taking them on shares for 5 years. He had returned 36 to the lowner and now had 40 of his own.

The total amount of bees reported

in Utah is 5,174 colonies, averaging 50 lbs. of honey to the colony would make 268,700 lbs. Total amount of revenue at 12½ cts. per lb., wholesale, 259,997 50

\$32,337.50.

James Wrathall, of Grantsville, James Wrathall, of Grantsville, Tooele County, spoke of foul brood, and deprecated the use of hives or frames having been diseased.

Vice President Samuel McKay, said he could not consent to or encourage tampering with fond brood. We have a law on the subject, but it needs re-vising. Moved that a committee of vising. Moved that a committee of six be appointed to revise the law. They were elected as follows: A. M. Physical Denoison of C. R. Bailey, Sam-Musser, President; G. B. Bailey, Sam-nel McKay, Edward Stevenson, Wm. Egan, Jesse Murphy and Horace Drake.

Horace Drake, of Salt Lake City, had no foul brood in his apiary; his bees had done well this year. Edward Stevenson had taken 5 col-

onies into a new locality where he increased them to 9, and had taken 515 lbs, of honey from them. His bees had done quite well this season; he had done quite wen this season; ne had destroyed some hives of foul brood that came under his observation. He moved that every bee-keeper in Utah resolve himself as a bee-inspector until our country is cleared of the pest.

Carried unanimously.

George B. Bailey had taken care of 230 colonies of bees that were in good condition; had destroyed some foul brood, and had taken about 8,770 lbs. of honey. Moved that the minutes of the meeting be published.

EDWARD STEVENSON, Sec.

The annual meeting of the N. W. Illinois and S. W. W. W. Illinois and S. W. Wisconsin Bee-Keepers' Association, will be held in Temperance Hall, Freeport, Stephenson Co., Ill., on Jan. 17 and 18, 1882. JONATHAN STEWART, Sec.

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

Office of American Bee Journal, ) Monday, 10 a, m., Dec. 5, 1881.

The following are the latest quota-

tions for honey and beeswax received up to this hour:

### CHICAGO,

HONEY—The market is lively and prices steady. We quote light comb honey, in single comb boxes, 180020; in larger boxes 2c, less. Extracted

BEESWAX - Prime quality, 18\(\tilde{a}\)22c. AL. H. NEWMAN, 972 W. Madison St.

### NEW YORK.

HONEY-The supply is full, and trade is lively. We quote as follows: White crub, in small boxes, 180.22c; dark, a small boxes, 180.22c; dark, a small boxes, 180.24c; dark, a small boxes, 180.24c; dark, pointe, 180.24c; dark, 700.6c; dark, 70

### CINCINNATI.

HONEY-Is in good demand here now.

1 quote: Good comb honey, in sections, is worth

8 EESWAY,-19822C., on arrival. I have paid

5c, per lb. for choice lots. C. F. MCTH.

### BOSTON.

HONEY.—1-pound combs are a desirable pack-ge in our market, and a large quantity could be old at 250-220c, according to quality. BEESWAX—P une quality, 25c. CROCKER & BLAKE, 51 Chatham Street.

### BALTIMORE

HONEY.-But little on the market, and prices are not quoted.

BEESWAX.—Southern, pure, 21@23c.; Western, pure, 21@22c.; greuse wax, 11c.—Baltimore Market Journal.

### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb, sections, 22@25c,—Indianapolis Stock Review.

### PHILADELPHIA.

HONEY.-The supply and demand are alike nommal. BEESWAX – Best light 23@25c.– Philadelphia Merchants' Guide,

### ST. LOIDS.

HONEY.—Steady, with sale for all offered at quotations; comb at 186/29c.; strained and extracted, 86/29c. for rates for choice put up in small packages suitable for retailing.

BEESWAY.—Sching hehtly at 186/20c.
R. C. GREER & CO., 117 N. Main Street.

### SAN FRANCISCO.

HONEY—A sale of choice white extracted in barrels is reported at 184.c. A shipment of 116 cases was made this week to Sydney. Consignments arrive with sufficient frequency and in sufficient quantity to prevent any great reduction in stocks. We quote white comb, 16620c. (dark to good, 1064 14c. Extracted, choice to extra white, 83µa 10c.) dark and ennided, 76x8. BEESWAX—23621c.

STEAKNS & SMITH, 423 Front Street.

### CLEVELAND.

HONEY-Our market for choice white honey in 14b, nightessed sections continues very active at 20c; 24b, niindhassed at 20b 21c; binckwheat raiber slow at 18c. Glassed sections would have to be sold 36 etc. per 1b. less. Extracted selling slowly at 12c, per 1b.

BEESWAX-186020c.

A. C. KENDEL, 115 Ontario Street.

# SELECTIONS FROM

Multum in Parvo.-Please answer the following questions in the monthly edition of the Bee Journal, and enlighten a beginner: 1. Will a colony of queenless bees, or one with a virgin queen, if given brood late, live through the winter, and will the drones of such queens possess fertilizing power? I am anxious to secure a number of Italian drones early in the spring, as I want to Italianize all of my bees. 2. 14 Am to thanding and my offs; 18 the produce drones sooner than any other queen under the same treatment? 3. If 1 place drone comb in the middle of the brood drone comb in the middle of the brood chamber as soon as the queen begins to deposit eggs in the spring, will she occupy those cells? 4. We have had two severe frosts, and only a few of my colonies have brood, do you think they will winter? The queens stopped laying after the tirst cold spell, and some even before, I suppose on account of the drouth. 5. Will a colony if queenless, and without larvæ, build queen cells? 6. Is there any such thing as fertilizing in confinement, and if so, please give us the modus operandi? 7. Is it well to winter bees in a warm place out-of-doors, or simply protect them from the wind?

[E. M. Gresham.

E. M. Gresham. Carlton's Store, Va., Oct. 20, 1881.

[1. If given brood late, they should winter through, but will dwindle so rapidly in spring that it is doubtful about rearing drones. Scientists generally agree that drones reared from a virgin queen possess procreative powers, and though inclined to doubt it at times, we are not prepared to deny it.

2. No; most likely not so soon.

- 3. Yes.
- 4. Yes; with intermitting cold weather, all queens will cease breeding in the fall.
- 5. No; they frequently start them, but soon abandon the work, before completion.
- 6. Fertilization in confinement has not been practically accomplished: exceptional cases have been so few. and attended with so much uncertainty, as to make it unsatisfactory.
- 7. Such a winter as the last requires something more than a mere protection from the wind. Several of these points have been very elaborately dis cussed in the weekly editions of the BEE JOURNAL, and we can only answer queries in the briefest manner possible, to save going over familiar ground in giving reasons why.—Ed.]

Wintering, Cyprians, Etc.—1 put my bees into winter quarters in the cellar before the cold weather set in. I put away, in good condition, 72 colonies in all. Of these, 50 colonies were in good condition as to quantity of bees and honey, while 22 were weak in bees and light in stores. I shall observe next spring if any difference is observable in the wintering qualities of Italians and Cyprians, as I placed in the same repository 56 colonies of the former and 16 of the latter. I will also have a good opportunity I will also have a good opportunity to observe as to whether the Cyprians to observe as to whether the Cyprians are so very much more prone to sting than the Italiaus, for in setting out on summer stands, if a warm-like day in the spring, any bees, if at all disposed to sting, will manifest it then. That the Cyprians make much treer use of their business-end than the Italians, is almost a foregone conclusion with me from my observation in sion with me, from my observation in handling them the past summer. but I will suspend judgment till spring.

J. W. McKinney.

Camargo, Ill., Nov. 26, 1881.

Off Year for Honey.—Though this has been an "off year" with us as regards honey, our faith in the "blessed garus noney, our faith in the "biessed bess" as a source of permanent in-come, is unshaken. The Weekly BEE JOURNAL is as invaluable to the prac-tical as well as the amateur apiarist. GEO. A. TEMPLE. Santa Barbara, Cal., Nov. 23, 1881.

Poor Season for Honey.—The unfavorable weather of last winter for bees, has been followed by a poor summer about here. The bees were able to gather but little honey after July to gather but little honey after July 15, owing to the severe and protracted drouth: hence those who waited till after swarming time, before putting on the surplus honey hoxes, failed to secure anything in them, and many colonies will starve out if not killed.

Pattenburg, N. J., Nov. 25, 1881.

About Preparing Bees for Winter.

—I have watched with much interest the different methods given for preparing bees for winter, but as yet 1 see nothing that is of any practical value to me or any of my neighbors. Now, if I had the various improvements that most writers speak of, or upper stories, or a cellar, or any amount of other paraphernalia, some of the articles in the BEE JOURNAL could be practically carried out. Most of the bees in this country are blacks, in the old-fashioned box or log live. Some have introduced the Italian, and claim points of superiority for it over the black bee. The winter most generally puts in a claim for from 25 to 50 per cent., and has almost stripped the country of bees. A new era is dawning, and daylight appears. A little knowledge concerning their habits and wants, and man, heretofore their other paraphernalia, some of the artiwants, and man, heretofore their greatest enemy, will be their best friend. I have quite recently bought my bees, and have not had time to reduce the business to a system of profit or pleasure. Please suggest some simple and practical way that I may at this late hour adopt to protect them. WM. T. STURGILL. Pickering, Mo., Nov. 22, 1882.

[1f, as we suppose, the bees are in box hives and gums, and you have no cellar, the simplest method of preparing them will be to place them in a close row running from northeast to southwest-entrances to the southeast; at each end plant a post with a forked end up, lay on a pole reaching from one fork to the other, and carefully stand up cornstalks to the front, ends and rear, slanting them to leave the entrances clear and binding at the tops to run off the rain. This is the simplest and cheapest method we can give, and perhaps at this late day, and for this winter, will prove as efficacious as any. If you desire to realize both pleasure and profit from your bees hereafter, would advise you to transfer them into movable-frame hives in the spring, at the beginning of fruit bloom.-Ed.1

State Society for New Jersey.—With-out saying anything about "the baby" other than that I hope to see its face weekly, in its new pinafore for 1882, I would like to know what are the I would like to know what are the privileges and prerogatives of State Vice Presidents? Allow me first to say that I am not after the loaves and fishes—bread and honey are good enough. I was just thinking that it is time some one got up to speak his piece about a bee-keepers' association for New Jersey. I think it is about time she was befederalized. What do you think about it? you think about it?
G. W. THOMPSON,

Stelton, N. J.

[The " privileges and prerogatives' are not so lucrative as in many positions filled by not so good men; but, then, the consolation of a noble duty

well performed is a sufficient recompense to any high-minded apiarist. It certainly would be quite desirable to have a good society organized in New Jersey.—Ed.]

Sweet Clover on Bottom Lands.—In the BEE TOURNAL of Nov. 2d. A. J. Nortis wishes to know whether sweet clover will do well on lands that are overflown once or twice a year? It does well here on the Maumee river bettons, which are overflown every bottoms, which are overflown every time of high water. Lam transplanting it on my grounds. Bees are in their room in the cellar, enjoying their winter's rest. L. Eastwood. Waterville, O., Nov. 28, 1881.

[This removes the last doubt. Mr. W. J. Stewart says "sweet clover will grow anywhere except on a flat rock," and it will be necessary to keep that pretty clean of dust.--ED.

Bee Pasturage on Bottom Lands. We have had a very poor honey harvest here during the forepart of the season; bees have done very well but the drouth cut off all of the fall harthe ground cut off all of the fall harvest. I have 8 acres of bottom land 1 wish to put in some kind of clover that will make the best forage for bees and the best pasture for cows. The land is rather wet; what kind would you recommend?

Madaghara Lang Yee 20 2017 ou recommend? E. Doty. Macksburg, Iowa, Nov. 26, 1881.

[Sweet clover, by all means.—ED.]

Premiums. - Those who get up clubs for the Weekly Bee Journal for 1882, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2,—a copy of "Bees and Honey,"
3,—an Emerson Binder for 1882.
4,—Cook's (Bee) Manual, paper. 5,- " cloth.
6.-Weekly Bee Journal for 1 year.

Or they may deduct 10 per cent in cash for their labor in getting up the club.

We are sometimes asked who onr authorized agents are? Every subscriber is such an agent; we have no others, and greatly desire that each one would at least send in one new subscriber with his own renewal for 1882. The next few weeks are the time to do this. We hope every subscriber will do his or her best to double our list for 1882.

New subscribers for the Weekly BEE JOURNAL, for 1882, will have all the remaining numbers for 1881 free from the time the money is received at this oflice. Therefore, the sooner they subscribe for it, the more they will obtain for the \$2.

😰 Subscriptions may commence with the first number of any month in the year.

The South Eastern Michigan Bee-Keepers' Association, will hold its annual meeting at the Court House in Ann Arbor, on Thursday (and perhaps Friday), commencing Dec. 15, 1881, at 10 a.m., for the election of officers for the ensuing year, and such other business as may be brought before the Association. A good attention fore the Association. A good attendance and interesting meeting is exwill be discussed by able men.

N. A. PRUDDEN, Pres.
G. J. Pease, Sec. protem.

The Nebraska State Bee-Keepers' Association will hold its annual meeting in Ashland, Neb., on the 12th and 13th of January, 1882. A cordial invitation is extended to all who are interested in bee-culture.

T. L. VONDORN, Pres., Omaha. G. H. HAWLEY, Sec., Lincoln.

### Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists
—Langstroth,Dzierzon, and the Baron
of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the old as well as the new address.

Those who may wish to change from other editions to the Weekly,can do so by paying the difference. ....

© Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

The Color and Lustre of Youth are restored to faded or gray hair by the use of Parker's Hair Balsam, a harm-less dressing highly esteemed for its perfume and purity. 49w4

A Sample topy of the Weekly Bee Journal will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Abrays send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city excent at a discount of 95 cents to pay except at a discount of 25 cents, to pay expense of collecting them.

Rhenmatism is the most terrible disease that has ever afflicted humanity, yet it instantly yields to the powerful drugs that Kendall's Spavin Cure is composed of.

KE It would save us much trouble, if all would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—Also, if you live near one postoffice and soft were remission to most have the get your main at another, be sure to give the address we have on our list.

It will pay to devote a few hours in getting up a club for the BEE JOURNAL. Read the list of premiums on another page, and take advantage of the fall gatherings to get up clubs.

It is Worth Remembering that no-body enjoys the nicest surroundings if in bad health. There are miserable people about to-day with one foot in the grave, when a bottle of Parker's (finger Tonic would do them more good than all the doctors and medi-cines they have ever tried. See adv. 49w4

We have a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in 1882 (16 pages). for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

### CLUBBING LIST FOR 1882.

We supply the Weekly American Bee Journal and any of the following periodicals, for 1882, at the prices quoted in the last column of figures The first column gives the regular price of both. All postage is prepaid by the publishers.

Published Monthly at Columbus, Kan.,

A new sixteen-column bee paper, devoted entirely to the best interests of honey producers; dealers in Supplies and breeders of Queens and Bees. Will be sent to any address one year for only thirty cents. We club with the Weekly American Bee Journal for only \$2.15. Sample copies free. Address, SCOVELL & ANDERSON, 28wtf Columbus, Kansas.

Important to Grocers, Packers, Hucksters, and the General Public.

### THE

# King Fortune-Maker, OZONE A New Process for Preserving all Perishable Articles, Animat and Vegetable, from Fermentation and Putrefaction, retaining their Odor & Flavor.

"OZONE-Purified air, active state of oxygen."- WEBSTER.

This Preservative is not a liquid, pickle, or any of the old and exploded processes, but is simply and urely OZON E, as produced and applied by an entirely new process. Ozone is the autoseptic principle is every substance, and possesses the power to preserve animal and orgenable structures from deepy. There is nothing on the face of the carrib Hable to decay or spoil which Ozone, the experience will not preserve for all time in a perfectly fresh and published.

ew Preservative, will not preserve for all time in a percessory condition.

The value of Gone as a natural preserver has been known to our abler chemists for years, but, until now, no means of producing it in a practical, inexpensive and simple manner, have been discovered. Micro copic observations prove that decay is due to septic matter or minute geros, that develop and eed upon animal and vegetable structures. Ozone, applied by the Prentise method, series and detroys these germs at once, and thus preserves. At our offices in Cincinnati can be seen almost every trule that can be thought of, preserved by this process, and every visitor is when mentions to come in, taste, mell, take away with him, and test in every way the merits of Ozone as a preservative. We will also reserve, free of charge, any article that is brought or sent prepaid to us, and return it to the sender, or him to keep and test.

spiell, take away with min, and test, in every way the method of zone as a preserved, and return it to the sender, for him to keep and test.

FRESHI MEATS, such as beef, amitton, yeal, pork, poultry, game, dish, &c., preserved by this method, can be shipped to Burope, subjected to atmospheric changes, and return to this country in a state of perfect preservation.

EGGS can be received to a such as the subjected to atmospheric changes, and return to this country in a state of perfect preservation.

EGGS can be received to a subjected to atmospheric changes, and be kept in an ordinary room as more thoroughly preserved, the york held in its normal condition, and the eggs as tresserving exes is readily seen; there are sensors when they can be bought for so I to contract to the contract of the subject of the s

as well and as succession. A room diled with different at teles, such as eggs, nieat, fish, etc., can be treated at one time, additional trouble or expense.

25 In fact, there is nothing that Ozone will not preserve. Think of everything you can that is liable to sour, decay or spoil, and then remember that we guarantee that Ozone will preserve in exactly the condition you want if for any length of time. It you will remember this, it will sake asking questions as to whether Ozone will preserve this or that article—it will preserve anything and everything you can think of.

There is not a township in the United States in which a live man cannot make any amount of money, from \$1,000 to \$10,000 a year, that he pieases. We desire to get a live man interested in each county in the United States, in whose hands we can place this Preservative, and through him secure the business which every county ought to produce.

# A FORTUNE Awaits any Man who Secures Control of OZONE in any Township or County.

en, Marion, Ohio, has cleared \$2,000 in two months; \$2 for a test package was his first in-

vestment.

Warren County, Ohio, made \$1,000 on eggs purchased in August and sold in November; \$3 for a test package was their first investment.

F. K. Raymond, morristova, Belmont County, Ohio, is clearing \$2,000 a month. In handling, and selling Ozone; \$2 for a test package was his first investment.

D. F. Webber, Charlotte, Enton County, Mich., has cleared \$1,000 a month since August; \$2 for a test package was his first investment.

Charlotte, Baton County, Mich., has cleared \$1,000 a month since August 1 as drst investment.

So first investment.

So Laxalie street. Cheago, is preserving eggs, fruit, etc., for the commission men of ing 14gc, per dozen for eggs and other articles in proportion. He is preserving 5,000 eggs in his business is making \$5,000 per month clear; \$2 for a test package was his first in-

ment.

e Uncinnati Feed Co., 498 West Seventh Street, is making \$5,680 a month in handling brewers, preserving and shipping it as fee—to all parts of the country. Mult unpreserved sours in 24 hours; revel by Ozone, it keeps perfectly sweet for months, see are instances which we have asked the privilege of publishing. There are scores of others, et any of the above parties and zet the evidence direct.

Now, to prove the absolute truth of everything we have said in this paper, we propose to place in your bands the means of proving for yourself that we have not claimed half enough. To any person who doubts any of these statements, and who is interested sufficiently to make the truth, we will pay all traveling and hotel expenses for a visit to this city, it we fail to prove any statement that we have made.

### HOW TO SECURE A FORTUNE with OZONE.

A test package of Ozone, containing a sufficient quantity to preserve one thousand dozon eggs, other articles in proportion, will be sent to any applicant on receipt of \$2. This package will enable applicant to pursue any line of tests and experiments be destress, and thus artisty houself as to textraco dinary ments of Ozone as a Preservative. After having this satisfied himself, and had time look the field over to determine what he wishes to do in the future—whether to self the article to other to conflue it to his own use, or any other line of poncy which is best satisfed to him and to his tow ship or county—we will enter into an arrangement with him that will make a former for him and go as good profits. We will give exclusive township or county privileges to the first responsible applied who orders a test package and desires to control the business in this locality. The man who secure control of Ozone for any special territory, will enjoy a monopoly which will sure correct him.

control of Ozone for any special territors, who expend to the control him.

Don't let a day pass until you have ordered a Test Package, and if you desire to secure an exclusive privilege, we assure you that delay may deprive you of it, I is the applications come in to us by scores every mail—many by telegraph. "I st come first served," is our rule.

It you do not care the send money in advance for the test package, we will send it C.O.D., but this will put you to the expense of charges for return of money. Our correspondence is very large; we have all we can do to attend to the shapping of orders and giving attenuou to our working agents. Therefrom, we cannot give any attenuou to letters which do not order Ozone. If you think of any article that you are doutful about Ozone preserving, remember we guarantee that it will preserve it, no matter what it is.

What It is.

REPERENCES—We desire to call your attention to a class or references which no enterprise or firm based on anything but the soundest onsides and highest commercial ment could secure. We refer, a permission, as to nor integrity and to the value of the Precitis Preservatives, to the following gentlemen: Edward C. Boyce Member Board of Public Works; E. O. Esheby, City Competoller; Amos Satish, Jr., Collector Internal Revenue; Wutsin and Worthington, Attorners; Martin II. Harrell and B. F. Hopkins, County Commissioners; W. H. Cappeller, County Anditor, all of Cincinnia, Hamilton County, Ohio—These gentle are each familiar with the merits of our Preservative, and know from actual observation that we have without question

### The Most Valuable Article in the World!

The \$2 you invest in a test package will surely lead you to secure a township or county, and then you way is absolutely clear to make from \$2,000 to \$10,000 a year.

Give your full address in every letter, and send your letter to

# The Bee-Keeper's Guide;

MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages: 133 Pine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months — a sule imprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and per-sistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings— the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants,trees, shrubs, etc., splendidly illustrated-and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the opening. It is not only instructive but the iparist. It is not only instructive, but intensely interesting and thoroughly practical.

-:0:-Read the following opinions of the Book;

All agree that it is the work of a master and of eal value.—L'Appendiure, Paris.

1 think Cook's Manual is the best of our American works.-LEWIS T. COLBY.

It appears to have cut the ground from under utme book-makers.—British Bee Journat. Prof. Cook's valuable Manual has been my con-tant guide in my operations and successful man-agement of the apiny.—J. P. WEST.

I have derived more practical knowledge from Prot. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, ho one who obtains it, will ever tegret having purenased.—Mich. Far.

To all who wish to engage 'n bee culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticello, Ill.

manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully to with the times in every particular. The richest reward awaits its author.—A. E. WEXZEL.

My success has been so great as to almost astocian myself, and much of it is due to the clear, dismitted each internation contained in Cook's Manual.—W.M. VAN ANTWEILP, M. D.

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-taisers.—F.y. Lite Stock Record.

It is a credit to the author as well the publisher. I have never yet not with a work, either French or foreign, which I like so much.—I.ABBE DU BOIs, editor of the Bulatta D' Apaculteur, France. It not only gives the natural bistory of these hodustrions tusects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botamical description of honey producing plaints, and an extended account of the enemies of bees.—Democrat, Pulishki, N. Y.

enemies of bees.—Democrat, Punisk, N. Y. We have perused with great pleasure this rade means of the bee-keeper. It is replete with the best information on everything belonging to apiculture.—To all taking an interest in this subject, we say, othan this valuable work, read it carefully and practice as advised.—Agriculturist, Quebec.

This book is pronounced by the press and leading beenen to be the thost complete and practical teatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee man will welcome, and it is essential to every manateur in bee-culture. It is mandsomely printed, neatly bound and is a credit to the West.—Wistern Agriculturist.

to the West.—Wistern Agriculturist.
This work is undoubtedly the most complete minual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the appary. There is no subject relating to the culture of bees left unto ched, and in the compilation of the work Prot. Cook has had the advantage of all the previous knowlede of apparists, which he uses admirably to promote and make popular this most interesting of alloccupations.—American Inventor.

### The California Honey Crop.

Early in September we requested our readers to send on a postal card the results of the season, as to the honey crop, as will be remembered.

In the Journal for Oct. 5 we stated that the table was nearly complete, and would appear in the next number of the Bee Journal, but that we had received no reports from California.

On Oct. 12 we gave a "table of the honey harvest of 1881," so far as had been reported to us, and stated that it was necessarily incomplete as it only contained reports from one-twelfth of the bees in the United States. This was distinctly stated and should have been well understood, but by the Semi-Tropic California for November. just received, it seems that at least one does not comprehend it. Mr. C. N. Wilson, its correspondent, winds up an criticism as follows:

Now this Table may be all the editor of the AMERICAN BEE JOURNAL claims it is in other States and Territories, as well as Canada, but when the editor puts the number of colonies of bees at 520 for the whole State of California for the fall of 1881, we begin to wonder where and how the extra labor and study, and the expenditure of brain work, comes to play any part as "valuable or interesting." Let us get at facts, and then compare them with the statements of the very much over-worked editor's Table.

On the first Monday of March, 1881, the Assessor of Los Ångeles County, California, reported 16,613 colonies of bees in the county, and valued them at \$33,226, and their owners are paying taxes on that number of colonies. At the same time the Assessor found 575,000 pounds of honey on hand, and the owners of it are paying taxes on that quantity of honey, making a difference of 16,093 colonies of bees between the Table and the Los Angeles County Assessor's figures. The total honey product of California, according to the table, is 30,168 pounds, making a difference of 544,832 pounds as between our County Assessor and the editor's calculations. If one remembers that such men as Harbison, Wilkins, Flint, Hale and others who have long been in the business of bee-keeping, are residents of California, and any one of the persons named owning more colonies of bees and producing more honey than is credited to the whole State, and that some of them have shipped honey by the carload from California to Chicago, Ill., the very place where the editor does business and publishes the American Bee Journal, the question naturally occurs, if it would not be a very good thing for that editor to take Horace Greeley's advice and "go west," and save mental wear and tear—get a taste of some of our pure white sage honey—get acquainted with some of the honey producers of California, and interview the County Assessors as to the honey yield of California hereafter.

We never claimed that the figures represented more than one-twelfth of the honey crop—they were given as the result of reports sent to this office. If only a few of the honey producers of California reported, it was no fault of ours, and certainly it is with bad grace for Mr. Wilson to abuse us for not publishing a report which he never sent in!

The BEE JOURNAL was well aware that the reports from California did not represent more than one-twelfth of the product of that State, and only one-twelfth of the whole crop for the United States—and it, therefore, argued thus: "If the one-twelfth that are reported are a fair average of the whole, then the crop of American honey for ISSI amounts to 120,000,000 of pounds," etc.

In the face of these facts, is it not strange that Mr, Wilson should have misunderstood the Table, and have thought his unjust criticism necessary to defend the honey interests of his State.

While on this subject we may mention the fact that the printer omitted to "point off" the last two ciphers as cents of the amount given as the value of the honey mentioned in the BEE JOURNAL of Oct. 12. This amount ers.

should have been given as fifteen millions of dollars, as stated on the first page of the BEE JOURNAL for the following week (Oct. 19). We wrote the amount in words, and the printer put it in figures, and hence the error. This has been the subject of some criticism in the last Bec-Keepers' Exchange. An argument based on an error which was promptly corrected two months ago, is of no value, and is quite unnecessary to repeat.

#### Novice, Glucose and Grape-Sugar.

In Gleanings for November, Mr. Root quoted an editorial item from the BEE JOURNAL on the use of the glucose trash, and remarked:

"Now if that is not exactly where I have always stood in the matter, it must be I do not see things straight. It looks to me as if friend Newman had come over to my position," etc.

In the BEE JOURNAL for Nov. 16, we reiterated our position on this subject, and then quoted Mr. Root's published views, which were diametrically opposed to our own, for he advised its use to mix with honey, "to improve it for table use," etc. We then added these words:

Never have we counseled the sale or use of glucose for any purpose whatever, neither directly nor by implication; but, on the contrary, our protests against its use have been frequent and unqualified. We have sacrificed self-interest in our opposition to adulterations, and suffered much censure, but the most grievous injury we have yet received was from Mr. A. I. Root, who, with his grape sugar record before the public, unretracted, says "we are agreed."

To this Mr.Root replied in *Gleanings* for December as follows:

The first page of the American Bee Journal for Nov. 17, contains much valuable information, collected and arranged with considerable care; but had friend Newman explained to his readers in the outset that grape sugar and glucose are two distinctly different articles of commerce, it would have made a much better showing for your humble servant.

That this is but a quibble to evade the force of the argument, is evident from the fact that Mr. Root uses these terms interchangably in *Gleanings* for March, April and October, 1878, pages 87, 110 and 326. He says:

"The light *grape sugar* that we have been using 1 find almost as pleasant as maple sugar, and 1 have eaten it

as maple sugar, and I have eaten it freely for months."

"Glucose is excellent food, and we should like it just as well as honey, did it not lack the flavor of the flowers."

"Basswood honey is improved for table use by being mixed with the first quality of *glucosc*. I am sure it is just as wholesome as honey." "Our friend Dadant is doubtless

"Our friend Dadant is doubtless sincere in what he says of grape sugar, but for all that I think him very much mistaken. I have eaten it in large quantities, just as I would maple sugar, and have fed it to our bees for over a year," etc.

In order to arrive at the truth, let us imagine Mr. Root on the witness stand, and quote his replies from *Gleunings* and his price lists:

Will Mr. Root please give us his opinion of glucose? Answer: "Glucose is excellent food."

How do you know that it is good food? Answer: "The light grape sugar that we have been using (called glucose before), I find almost as pleasant as maple sugar, and I have eaten it freely for months."

Do you think it wrong to adulterate honey with glucose? Answer: "I really think that strong basswood honey is improved for table use, by being mixed with the first quality of alucose."

Do you think that mixture wholesome? Answer: "I am sure it is just as wholesome as honey."

Is the grape sugar which you have eaten for months, the glucose which you pronounce "excellent food," and the grape sugar which you have fed to your bees, the same thing? Answer: "I have eaten it in large quantities, just as I would maple sugar, and have fed it to our bees for over a year without a single had feature showing itself, so far as I know."

Is that "glucose" or "grape sugar" the same as the article of commerce? Answer: "It has been used largely all over our land, and is now quite an article of commerce."

Who makes the wholesome article you have been eating and feeding the bees with? Answer: "I am sure that that made by the Davenport Glucose Co. is wholesome."

What was the result of your feeding it to the bees for winter stores? Answer: "The first experiment I ever made with it for wintering, caused the death of two colonies.... They did not have the dysentery, but simply starved on heavy combs of solid grape sugar."

For what use have you advised grape sugar? Answer: "I have favored the use of grape sugar for feeding bees and nothing else."

As grape sugar has caused the death of your bees, as well as many others, what advice will you in future give in relation to it? Answer: "As this (grape or corn sugar) is, without question, unsafe for wintering, and as a great prejudice exists in the minds of many of our bee friends in regard to it, I have for the present ceased to offer it for sale."

So then, at last, we have drawn out the truth. Mr. Root has changed his position on this matter, and has advised against the use of grape sugar. How much better it would have been for Mr. Root to have acknowledged it, than to have tried to assume that he stands where he has "always stood in the matter." By saying, "It looks to me just as if friend Newman had come over to my position," he apparently intended to cover up the real truth.

Since the above was put in type we have met Mr. Root at the Michigan State Convention, at Battle Creek, which occurred last week. J. II. Kellogg, M. D., Managing Physician at the Sanitarium, lectured on the adulteration of honey before the Convention. Mr. Root was in the audience, and we took occasion to publicly ask Dr. Kellogg to explain the difference between the articles known to commerce as glucose and grape sugar. He replied that there was no difference. except that the liquid was called glucose and the solid was named grape sugar, to distinguish them commereially. Both were manufactured from the same material and alike, with the single exception of the addition of other chemicals to solidify that designated as grape sugar. And in this opinion Dr. Kellogg is sustained by all the chemical experts of this country and Europe almost without exception. After listening to Dr. Kellogg, and hearing his emphatic endorsement by the Convention, we expect Mr. Root will acknowledge his error in advocating the use of glucose for any purpose, and forever abandon its sale.

We have received from Prof. Adolphson, in Zurich, Switzerland. the first number of a new semimonthly bee periodical, entitled Illustrirte Bienenzeitung. If the publisher makes good his promises, and to judge by the appearance of this first number he will, we can predict success in the full sense of the word. It compares very favorably with older publications of the same character, but, much like the more progressive Americans, takes a more advanced and practical view of apiculture, on account of which it will be ahead of older papers in many respects. We think, therefore, it deserves the most liberal support from the German-reading apiarist; the subscription being only \$1.00 per year, exclusive of postage, would be money well spent. We wish it success.

🕼 Capt. W. J. Andrews, Ex-President of the North American Bee-Keepers' Society, has been elected Mayor of Columbia, Tenn. We congratulate him upon this mark of esteem by his townsmen.

In the BEE JOURNAL of Nov. 23d, page 371, in the article, "The Knowledge Possessed by Bees," in several places the word "corner" oceurs, which should read cover.

Michigan State Convention.-The Michigan State Bee-Keepers' Convention at Battle Creek, last week, was largely attended, and will compare very favorably with any bee convention held in America for the past ten years. Many of the most prominent apiarists of the State were present, and the discussions were marked by rare intelligence and enthusiasm. Mr. James Heddon, of Dowagiac, Mich., was chosen President for the ensuing year, and T. F. Bingham, of Otsego, Mich., was re-elected Secretary. We will publish a report of the proceedings next week.

### Apiary Record Book.

It devotes 2 pages to each colony, embracing between twenty and thirty headings, neatly ruled and printed, with space at bottom for remarks, and so arranged that a single glance will give a complete history of the colony. Each book will also contain printed rules for the apiary, and twelve pages ruled and printed for an apiary cash account. As each book is intended for a several years' record, it is gotten up on first class paper, and strongly bound in full leather covers. There will be three sizes, sent postpaid, at the following prices:

For 50 colonies (120 pages).....\$1 00 " 100 colonies (220 pages)..... I 50 " 200 colonies (420 pages)..... 2 00

Send in your orders at once, and the books will be forwarded as soon as completed. .

Sad Bereavement,-Dr. Howard's many friends will read the following letter with sorrow, and join us in tendering him sympathy for his late bereavement:

I have just passed through a trying ordeal, and my plans for the future are somewhat unsettled. I have the misfortune to have lost my wife; she died on the 10th inst., of typhoid fever, after 21 days of suffering. I have 3 little children to care for. I hope to ver, after 21 days of suffering. I have 3 little children to care for. I hope to be enabled to do my duty toward them. I think I will be able soon to resume my business. I have now filled all orders for supplies up to date, but am behind with my work. My present intention is to continue here. I trust this may be an excuse sufficient to satisfy those who have had orders delayed, should any one compluin. layed, should any one compluin.

W.M. R. HOWARD.

Kingston, Tex., Nov. 28, 1881.

A Rare Opportunity.—Until further notice, any subscriber who desires to obtain a good book on apiculture, can have either Cook's Manual, Quinby's New Bee-Keeping, or Novice's A BC. bound in cloth, postpaid, and the Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75. The JOURNAL and all four books for \$5.50. This is a rare chance to get a good library on beekeeping. A person can sell the books for their published price, \$4.75, and get the Weekly BEE JOURNAL for the extra 75 cents and his trouble.

We have received the illustrated Catalogue of E. Whitman, Sons & Co., 141 W. Pratt St., Baltimore, Md., which is a book of 160 pages, full of instructive reading to farmers and horticulturists. This is a work highly denditable fat this popular time and horticulturists. This is a work highly creditable to this popular tirm, and every farmer should possess a copy. Enclose them 5 cents for postage and get a copy.

#### MISCELLANEOUS.

Next Scason's Crop of Honey.—The Semi-Tropic California, makes the following remarks on this subject:

The bee outlook, although not as bright as it might be, owing to the light crop of honey produced this year, has fair promises for the future. Colonies generally are strong, and next spring will probably find them in good and the form of the control of the cont condition for a profitable summer's work. Experience is teaching our bee men how to assist their colonies during an off year, and lewer tailures occur in this industry now than for-

Wintering Bees in Kentucky.-Mr. W. Williamson, Lexington, Ky., writes to the Farmers' Home Journal as follows:

We have just prepared our bees for winter, having been too busy to do so a month ago. We have discarded all a month ago. We have discarded al double walls, and agree with Mr. De double walls, and agree with Mr. Demaree in this respect, but can hardly go so far as he does when he says they will "in this climate generally winter without care, if they have plenty of stores to subsist upon." This may be safe so far as Mr. Demaree is concerned, who feels confident, because he understands fully the condition of every colony; he has examined minutely their strength, stores on hand, age, and whether the colony is queenage, and whether the colony is queen-less or has a young and vigorous queen. These are all conditions that must be considered in adopting Mr. Demarce's plan. We have prepared ours in the following simple and inex-

pensive manner:

Have put one thickness of cotton about one-half inch thick inside of regular Langstroth frame (which we use exclusively), then cover over tightly both sides of frame with common unbleached cotton; you have a neat, compact absorbent and comforter combined. We took out of each hive the two outside frames of comb and placed instead the two frames as above prepared, then put on top a quilt—any warm material will answer. We remove all frames out of second story, but leave second story on hive so that during warm spells in winter the quilt can be slightly raised for ventilation. We believe with a good supply of honey on hand and strong colonies, with this protection our bees are safe, but will give results next spring.

Locusses and Wile Honey .- The following is an amusing item, for which the Nashville, Tenn., American is responsible. It says:

The New York Sun's reference to the Baptist Social Union at Delmoni-eo's, and the absence of the locusts and wild honey which formed the food of John the Baptist, recalls a little Sunday-school incident which we will avouch has never been in print, and is pure fact. He was a country 'Squire, an Elder, a most excellent man with When honey is sold by the producer, an Elder, a most excellent man with all the pretentious ignorance of the Dogberry, or Fielding's Squire. The lesson was in John. The boys had formed various theories about the "locusses and wile honey;" but the asking of questions was not encour-aged; it gave trouble sometimes. The teacher was in the habit of revealing all that ought to be known which was all that ought to be known, which was all that ought to be known, which was all he knew, plus a large amount he did not know. "Now, boys," said he, raising his specs, "I expect you all want to know what kind of locusses and wild honey John the Baptist et in the wilderness. The kimintators make out it was the seventeen-year locusses and bee honey!"

Here the 'Squire lifted his spees higher and assumed a severe judicial expression, as if he were about to expound the law or construe the statutes. The kimintators was but man with ke passions as ourselves. They were like passions as ourselves. They were never inspired. The seventeen-year locusses, as you all well know who have sense enough to have seen 'em, isn't fitten to eat, and it's my o-pinion, as being a significant to eat, and it's my o-pinion, as being a significant to eat, and it's my o-pinion, as being a significant to eat. as bein' against nachur, John never et 'em. The Jews was mighty particular, and they never et pork till the Lord showed Peter what was good. Lord showed Peter what was good. If the seventeen-year locusses had been in that sheet I told you about they'd a flew away, wouldn't they? It's against reason that John ever et such trash. He was goin' about his master's work and had no time for foolin' with bee trees, and what's more, bees ain't found in the wilderness away from settlements. Now more, bees ain't found in the wilderness away from settlements. Now, I'm going to tell yon boys what he et in my o-pinion. It was honey locusses; you've all et'em, and I've et 'em, when I was a boy—the common honey locusses and nothing else." There was a general assent; all the boys had eaten "honey-locusses," or fruit of the three-thorned acacia, and the explanation saved the reputation of John the Baptist in the matter of taste. the Baptist in the matter of taste.

Bees as Educators.-Rev. W. F. Clarke, in the Bee-Keepers' Guide, speaking of his recent visit to the eelebrated bee-islands of Mr. D. A. Jones, says:

"It has increased my interest in bee-A masincreased my interest in bee-keeping, and my confidence in it as an industry bound to grow to large propor-tions. There is ample scope yet for science and practical skill to improve it Success in it requires qualities of science and practical skill to improve it. Success in it requires qualities of a high order, and it is a school of pa-tience, perseverance, enterprise and energy. In its advancement it will not only increase national wealth, but not only increase national wealth, but national worth. A good bee-keeper cannot be a bad man or woman. Bees are a kind of moral police; they detect character. They are tutors also, and train to excellence. Bright examples of industry, they rebuke the slothful. Not only as honey gatherers, but as educators, they are entitled to take rank as benefactors of the human race."

Selling Honey .- Mrs. L. Harrison in the Prairie Farmer, remarks as follows on this subject:

There are many good producers who are poor salesmen, and they are as numerous among bee-keepers as any

numerous among bee-keepers as any other class. Honey, to sell well, should not only be produced in good shape, but be graded, and the different kinds kept seperate.

If the bee-keeper has managed his apiary intelligently, he knows what he has to sell and what it is worth, and will not dispose of it until he can realize its full value. There is a time to "sell" as well as to produce. We knew of beautiful white honey being sold last July in this city, by a commission firm, for 10 cents per pound. It was brought to market in a tub, and bees and these were troublesome, so it was forced off at this low figure. Had this honey been stored in prize

the best way is to store it safely, and then sell by sample. If it is on wheels, buyers know that it can be had soon for a ghost of a price, if they are in-different, as the owner is anxious to

go home. Extracted honey, Phonix-like, is rising from its ashes. Glucose nearly killed it, but it is now being sought after, and is in demand where it is known to be pure. Let the public once gain confidence in it, as the bona fide product of the bee, and it will need no further recommendation. A pleased customer will be its best advertisement.

### Three-Band Test of Italian Bees.

G. M. DOOLITTLE.

When the Italian bee was first brought to this country we were told that they were a distinct race of bees which had been excluded from all others from time immemorial, being confined to a certain district by the impassable Alps and the sea surround ing them. As these bees easily mixed with our black bees a test of purity was sought after, so that the buyer might satisfy himself whether he had bees as pure as those imported from As these bees easily mixed bees as pure as those imported from Italy, or whether they were a mixture of the two races, black and Italian. As it was hard to get queens purely fertilized, a few of those eager to sell all queens as pure tried to fix that test at something short of the three yellow bands, which was conceded by the majority should be the proper test, for surely all bees imported from Italy would show the said three bands. It was from this standpoint that I once wrote an article on the purity of Italian bees, which will be found in volume 7, page 10, of the AMERICAN

BEE JOURNAL.

At this time I considered all queens At this time I considered all queens whose bees did not come up to the standard of purity there given as being mixed with black blood on the American continent. After a little I reared a queen whose progeny nearly all of them showed 4 yellow bands. At this my faith in the purity of Italian bees in their original home was somewhat shaken, for, if these banded bees were pure, what could we call bees were pure, what could we call these four-banded bees. They could They could not be called more than a pure, so not be caused more than a pure, so we had to call them a "sport," as the vegetable growers do when a certain line of vegetables produce a different kind from the original.

About this time it became apparent to some that the bees in Italy were a mixed race, and we find the great German apiarist, Dzierzon, writing thus: "Throughout the whole race Italian bees, there is a slight trace of Italian bees, there is a significance of German blood, which, in the course of time, has found its way into it, as no Chinese wall, not even the Alps, has been able to keep the two races are titally couled from each other." nas been able to keep the two races hermetically scaled from each other." And now it appears that there is not only a "slight trace of German blood" in Italy (the long-continued home of the Italian bee), but that there are black and bybrid bees there also; and the or friends Thomas and Department. vet our friends Thomas and Demaree will talk about pure Italian bees. If there are black and hybrid bees in Italy, and also as Dzierzon asserts, "slight trace of German blood throughout the whole race of Italian bees pray, tell us where we are to look for purity.

This talking of purity of Italian bees in America, and of those of Italy (the land from which they were imported), as being mixed with black and hybrid as being mixed with black and hybrid blood, is very much like "sending coals to Newcastle." We must take A. I. Root's stand and say that all bees coming from Italy are pure Italpees coming from Italy are pure Italians, or else say that the purity of the Italian bee consists in what is called "thoroughbred," and call them Americanized Italians, stopping this talk about there being a pure race of bees.

As some wish to know where I stand, I will say that I take the latter

As some wish to know where I stand, I will say that I take the latter ground. Well, this being the case, what is meant by tested Italian queens? Now we come to the three-band question again, and will repeat what I said on page 285: "I claim every bee should show the three-bands while standing on the combs, to be such bees standing on the combs, to be such bees as I should want to breed from;" yet, "as far as my experience goes, I have yet to see the queen whose progeny show the three-bands under all circumstances," and see if I cannot define my position so it will be plain to

others. The abdomen of every worker bee is composed of six scales, or segments, one sliding into the other telescope fashion. With the black bee these scales are black, all of them. With the Americanized Italian the With the black bee first scale or segment beginning at the end of the abdomen next the thorax, is about % orange color, the other eighth being a black ring extending around the segment on the side oppo-site the thorax. The second segment around the segment on the side opposite the thorax. The second segment is about 4-5 yellow and 1-5 black, the black stripe or ring being toward the point of the abdomen, as on the first segment. The third segment shows about <sup>3</sup>4 yellow and <sup>1</sup>4 black. All these markings should be clear and distinct (not muddy or cloudy and mixed as is the case with some of the imported stock) while standing on the combs; not on a window pane trying mported stock) while standing on the combs; not on a window pane trying to fly and crawl up the glass. I say while standing on the combs, but wish to specify so as to meet my last statement, that "I have yet to see the queen whose progeny show the three vallow hands under all eigenmestances." ellow bands under all circumstances. These scales or segments I told you would slide into each other telescope fashion, and if a bee is stung by another bee, the abdomen will so draw up, or one segment slip into the other, so that scarcely any of the yellow can be seen, except on the first segment and the theory of the great when the ne seen, except on the first segment next the thorax, still the yellow bands are there, but don't show. The same is true to a more or less extent with the young bee when first hatched; that is, her abdomen is so draws: that is, her abdomen is so drawn up that the three yellow bands do not all Again in the fall when of them show. clustered together for winter in their undisturbed repose, they show scarcely more than the two bands; yet the three yellow bands are there all the same. Even a four-banded bee will so draw up her abdomen when preparing for a winter nap, that no yellow will show except on the two first bands, and the second band would not show if there was room in the first segment for the second to go inside of it.

I did not mean to say on page 285 that the yellow bands were not there all the same, only that they did not show under all circumstances.

bee, but I think they will. The reason why I am not satisfied with such bees as A. I. Root calls pure Italians, is because such bees have not proved themselves as good as those showing three clear, distinct yellow bands, and if we wish to seeme the best bee, we must begin with that which gives the best begin with that which gives the best grounds for success, and the three-banded bee gives us that ground in my humble opinion. As to my not knowing what the finest specimen of the yellow race look like, I will say that in former years I have had queeus from II. Alley, Adam Grimm, T. B. Hamlin, M. Quinby, Aaron Benedict, J. Nesbit, Mrs. Tupper, II. A. King, W. W. Carry and others. Later I have J. Nesbit, Mrs. Tupper, H. A. King, W. W. Cary and others. Later I have had queens of Jos. M. Brooks, W. W. Cary, J. P. H. Brown, J. P. Moore, L. C. Root, A. I. Root and many others too numerous to mention. It would be strange if some of these did not have as good bees as friends Thomas and Demaree have. I do not lay so much stress on bands as some do, for I prefer bees for honey rather than bands; still, as long as the bees showing the three yellow bands give us the best results, I believe that is the channel to work through till we find something that gives better promise. thing that gives better promise.

One thing Mr. Demaree has touched One thing Mr. Demare has tonched upon which I have never seen in print before, where he says that when on the window, "the meanest hybrids would show the third band in splotches." I will say that I have yet to see the bee that shows yellow on any band that does not show it on all three; so all talk about one and twoany band that does not show it on all three; so all talk about one and two-banded bees needs an explanation. We read bees with about one yellow band to show trace of Italian blood, are the wickedest bees to sting," while our experience proves that unless our experience proves that unless "telescoped," such a bee would show yellow on all three segments in about

the proportion that a good thoroughthe proportion that a good thorough-bred hee would; that is, if but little was shown on the first scale, still less would be shown on the second, and still less on the third, but there would be yellow on three of the segments if there was on any of them.

These are my honest views on the Italian bee question as far as my experience goes up to the present time, and if I have trodden on any person's corns by giving them, they will excuse I hope.

Experiments with Comb Foundation.

### JAMES HEDDON.

During the past season my assistants and myself have made the use and manufacture of comb foundation not manufacture of continual series of experiment. Much has been written and said bearing testimony in different directions, and we felt that positive and extended experiment was all that was left for us to indge by.

We began manufacturing last spring with four machines, viz.: A new Dunham 9-inch roller mill, a Vandervort 12-inch and Vandervort 6-inch roller mill, and a Given press, with one of Mr. Given's new improved die books. We first discarded the Dunham mill, because we could not make foundation necause we could not make roundation upon it that had high side-walls with-out the use of the objectionable soap-suds, and then only with difficulty. Next we laid aside the 6-inch Van-

dervort mill, because it not only run with great difficulty, but it made a line or side-wall in no way superior to the old style of foundation, though it did

old style of folimation, diought was a thinner base.

Next we tried the 12-inch Vandervort mill, which is designed by him expressly for the manufacture of heavy foundation for the broad department. vort min, which is designed by him expressly for the manufacture of heavy foundation for the brood department. This mill makes what we call the best foundation we have ever seen come from any roller mill, either for the brood chamber or surphis use. There are two samples of what we made in regular full-size sheets of that designed for both departments. The thin-base sample has a splendid line or side-wall. These samples, like all of the foundation we have made the past season, were passed through the rolls with the use of starch, and starch only. I wish to say that the manufacture of foundation with such side-walls costs more than double that of the old pattern, unless soap-suds be the old pattern unless soap-suds be used. It is now generally understood that the use of soap is objectionable to the bees, just in proportion to the amount used.

Upon the 12-inch heavy Vandervort mill we can make sheets nine inches wide, alleven and perfect, and as good wide, all even and perfect, and as good as the sample shown, averaging seven square feet to the pound. Much care is needed and the process is slow and tedious, where no soap is used, when we try to pass through sheets that run ten to the pound; the sheets will double together, and make us so much other trouble, that we fail to make the other trouble, that we fail to make the other trouble, that we fail to make the manufacture practical. Still, I be-lieve this same Vandervort 12-inch mill the best roller foundation machine on the best roller foundation uncernie on the market. I further believe that if we propose to make a foundation with perfect-formed and high side-walls, we must either use objectionable nonstickers or find the work impracticable. We should remember that samples of excellent foundation can be turned out in various ways that are not practical for the general manufacture. Every year I receive samples by mail, and wherever I have ordered a few pounds, I have never in a single a few pounds, I have never in a Singir instance received ever so small a lot equal to the samples. Nearly every piece of these samples betrays the use of soap. Some of our mill makersadof soap. Some of our mill makers advise the use of starch with some soap Pure beeswax is sticky stuff, and with so many high side-walls pressed so closely to an unequal number of points.

From all f can learn of others of metal some very slignory substance. so many mgn side-wais pressed so nome or purchased near therefo. closely to an unequal number of points of metal, some very slippery substance is needed to allow them to loosen. In the plaster casts, they do not give satisfaction. Their frailty,

Many have tried adulterating the wax with less sticky articles, but the bees

Our last work making foundation onr has work making rollings was done upon the Given press. I hought this machine in the spring of 1880, for the sole purpose of filling frames full of worker foundation, and frames full of worker foundation, and in a manner that would hold it in position under all circumstances. I have here samples of both the thick and thin Given foundation. The side lines are not so sharp as those of the Vanderyort or Dunham; therefore, while they are not quite as high, they possess more wax, because the base or sepfum is thinger. In every instance the bees In every instance the bees draw out all the wax in the lines. My assistant, Mr. Henry C. Farwell (now in Rutland, Vt.), and myself, have onducted a series of experiments during the season with different styles and thicknesses of foundation, and on an extensive plan. We have given it what is to our minds a thorough and comprehensive test, both in sections and super frames of 6x12 inches. We have put three styles in one of these frames, and have mixed things up in every way we could think of to get a satisfactory test—and right here I wish to say that we did it without the least an extensive plan. We have given it satisfactory test—and right here I wish to say that we did it without the least prejudice or desire what truths might come to the front. We cared for the truth only. I had three mills to make foundation, to use and to sell. I had an agency and profit for the sale of all the mills above spoken of. I could not he prejudiced; certainly my employees were not. The results show up very much in favor of both the manufacture and use of the Given foundation. dation.

Mr. Given claims that the new dies

are so constructed that the bulky sidelines are left only slightly pressed, and mes are left only stigntly pressed, and heing softer, are more readily and easily drawn by the bees. However that may be (which looks reasonable to me from the form of the dies), we found that the bees took earlier and more kindly to the Given foundation; that they draw it out further thinner. that they drew it out further, thinner, and left a thinner base when completed. In handling over 1,000 one-pound sections of comb drawn out last year from Dunham, Root and Given foundation, Mr. Farwell re-marked: "I can tell you every time which combs were made from Given foundation," "How?" I inquired. of the base," he replied. I looked it over again, and saw that such a different with the base of the b ence was really discernible.

I devised a plan whereby I succeeded in pressing sheets at the rate of 80 thin in pressing sheets at the rate of Sothin sheets (averaging 10 feet to the pound) in 25 minutes. But this speed is not the best of the discovery. I took them from the dry pile of sheets (my boy 10 years old peeled them apart for me) and passed through the whole SO with one lubrication, and I russed only the one lubrication, and 1 riused only the one uniteation, and I final only the first six sheets, all the remainder coming from the dies perfectly dry, and no racks for drying required. For some reason I failed to make the same process work with the type-metal rolls. probably because not adapted to that metal, as it seems to be to hardened copper. Latonce put to test the adaptability of this process to the likes and dislikes of the bees, and found it a success there, too.

I have no pecuniary interest in any one's mills. I shall not hold an agency for any in the future. This year's ex-perience teaches me that purchasers naturally prefer to trade direct with the manufacturers at the same price. I shall not hold an agency I think I should feel the same.

I predict that sales in foundation will soon be confined to local trade, as the truth is, and will "come up-permost," that it will remunerate well every bee-keeper who expects to keep not less than 25 colonies, to own a press, unless he can purchase its proa press, unless he can purchase its products near home. Comb foundation, in the flat, is practically merchantable for long distances; but that pressed into made-up frances costs high for transportation, and should be made at home or nurclessed near thouse.

and the mussy and dauby system that and the massy and daily system that goes with them, I think, is destined to shelf them sooner or later. Their only redeeming quality is that they make foundation upon the flat plate plan, and do away with side-wall pressure, pulling and stretching, the same as is the case with the Given dies. I think that no person can make so great a mistake as to hive swarms on empty frames, or those partly filled, or any not full of comb foundation. If you have not bees enough to afford a press, and live too far from one of your size frame to afford the enormous cost of frame to anote the transportation, by all means wire your frames, and buy full size sheets and fill them by hand with this best gift to bee-keepers — pure - beeswax foundation.

These sheets put on by hand work pretty well if carefully done, and though not so good as those put there by the press, and though a tedious job comparatively, it pays far better than not to do it, because perfectly straight all-worker combs, securely held by wires, are not only "athing of beauty" and "a joy forever" to look upon, but they are things of profit as long as they exist. Let us pay the debt of gratitude we honestly owe, by giving "honor to whom honor is due" for the discovery perfection and introduction by the press, and though a tedious job discovery, perfection and introduction of this splendid assistant to successful

bee-culture—comb foundation. Dowagiac, Mich., Dec. 7, 1881.

For the American Bee Journal.

#### A Model Bee-House.

JAMES MCINTYRE.

Recently I had the pleasure of visiting Mr. Whitfield, of Dundas, and found he had a bee-house which came the nearest to perfection of any I have seen. With his permission I will endeavor to give the readers of the BEE deavor to give the readers of the BEE
JOURNAL a brief description of its
principal points. Before proceeding,
however, let us inquire what is perfection in a bee-house? I think all will
agree that a house in which the air
can be kept pure and dry, and at any
desired temperature between 25. desired temperature between 35 and 50°, independent of the outside temperature, without opening the doors or in any way disturbing the bees, is all that can be desired.

The house is built above ground;

the noise is bain above ground; the wall contains 18 inches of dry saw-dust and a 4-inch dead-air space; on the floor above is 18 inches of sawdust, the bottom ventilator is 4 feet under The air enters the house, and 100 feet long. The air enters the house through this at a temperature of 45° winter and summer. While we were walking out to the bee-house Mr. Whitfield remarked that after putting his bees in the weather became warm the training his bees in the weather became warm, the temperature of the house rose to 70°, and the bees came out on the fronts of the bees came out on the fronts of their hives; this set him to thinking how he should keep them cool, and he finally decided that the best thing he could do was to put in a stove. I hardly knew what to think of such a statement as that, but soon found it to be a fact.

be a fact.

When we arrived at the house he led when we arrived at the house he led the way up a flight of stairs on the out-side of the building, and entered above. Here we found a small coal stove inclosed in a tin box, with a pipe running from the top of the box out through the roof, and another from the bottom down into the house below. The hot air in the box passing upward. caused the air to rush in through the bottom ventilator at a temperature of 45 , which soon brought the temperature of the house down to 48; this made the bees enter their hives and remain perfectly quiet. The hot air seems also to attract the moisture from below, leaving the air dry and fresh. The thermometer is dropped through a hole in the floor near the stove, and is attached by a cord to the cover of the hole. By putting the ear to this hole in the graph learning the late.

for as soon as the outside temperature rises above the temperature of the house, the air ceases to circulate, and soon becomes very impure and warm. Mr. Jones has an arrangement for Mr. Jobes has an arrangement for holding ice near the top of the room to keep down the temperature, but will this cause the air to circulate—will it not make the air damp, and disturb the bees more or less opening the doors and putting in the ice?

As Mr. Whitfield's arrangement will only lower the temperature to 48- in warm weather, I would suggest an-other improvement by which it can be other improvement by which it can be lowered to 38 if desired, and still keep the air pure and dry, without entering the house: Make a box 18 inches wide, 6 feet long, 18 inches deep, with a coverto fit; cut a circular hole 7 inches in diameter in each end, and run a 7-inch stove-pipe through it; connect this with a pipe running through the wall and in the inside within a foot of this with a pipe running through the wall and up the inside within a foot of the top: fill the box with snow or ice with a little salt init, close the bottom ventilator, and allow the air to be drawn in through this pipe. Perhaps some will say this is too much trouble and expense. The stove only consumes 10 lbs. of coal per day, and as for the trouble, what is gained without care? Strathroy, Ont., Nov. 21, 1881.

For the American Bee Journal.

### New Methods of Wintering Bees.

WM, F. CLARKE.

The problem of wintering bees still awaits full solution. There is no method of which we can say that it will be uniformly and intallibly successful. As all signs fail in drouth, so all known methods of wintering bees fail during such a winter as the past. So we must keep on investigating, theorizing and experimenting.

### THE ANTI-POLLEN THEORY,

Mr. Heddon has conceded that at present, this is only a "guess." But he says in the course of his rejoinder to me, "I thought I had made it clear that I believed the eating of bee-bread by the older bees during continued confinement, was the cause of dysen-tery." So I thought. Hence my letter, the main object of which was to tone down what I considered unwarrantable confidence in a new, and as yet, untested theory. Mr. Heddon now puts it on the same footing as the now puts it on the same rooting as the "bacteria hypothesis." I am content. There let it rest until further light either relegates it to the "bacteria" oblivion, or exalts it into a discovery, in which latter agest I shall not be. only on, or exaits it into a discovery, in which latter case I shall not be-grudge Mr. Heddon his well-won honors. I do not need to answer Mr. Heddon's last article in full. It is made up of a re-statement of his former arup of a re-statement of his former arguments which I thought, and still think, inconclusive; of explanations, which are always in order, and of smart hits at myself, which, being good-natured, I take in good part, especially the closing one in regard to my prospects as a discoverer. Before I get through this article, it will be my prospects as a discoverer. Before I get through this article, it will be seen that I am on a voyage of discovery, and if I gain the promised land before he does, I am sure he will be as ready to crown me, as I have expressed myself to do him that honor, should be prove the lucky man. Meantime, the anti-pollen "hypothesis" is on its

#### HEAT IN THE GARRET.

An experienced Canadian bee-keeper, Wm. J. Whitfield, of Dundas, Ont., is crying "Eureka" over a method of wintering, which I do not know how to characterize better than by the above title. After trying a variety of plans for the past 20 years, he has hit upon one which he thinks is as near perfection as we are likely to get in perfection as we are likely to get in this world. Let me try to describe it: A sight is chosen for a bee-house on a

to admit the air from below. The to admit the air from below. The walls of the bee-house are constructed as follows: First a wall of 3x4 scantling tightly boarded on both sides, making a 4-inch dead-air space; 18 inches distant another similar wall, the 18-inch space being filled with dry sawdust. The bee-house is 16x20 ontside, and 12x16 inside. On getting thus far, Mr. W. found that he could not control the temperature. It was either too high or too low. Then he put a pide 8x8 inches through the celleither too high or too low. Then he put a pipe 8x8 inches through the ceiling, but still the house was either too cold or too hot, and more or less damp. cold or too hot, and more or less damp. Next he put in another pipe a little larger, bringing it in from the south end with an upright shaft 8 feet high. It was run along on the top of the joists to the back end, then down to within 6 inches of the floor, and covered with sawdust. This made things a little better, but improvement was needed yet. Both these pipes had a slide-board in them which could be opened or shut from the top. There was also a small pipe through which a thermometer could be let down and drawn up from above so as to find out drawn up from above so as to find out drawn up from above so as to find out the temperature without disturbing the bees. A controllable draft of air was wanted, and to secure this, a small coal stove was put in the garret over the bees. A box was made and lined with zinc to hold the stove. Near the back end, a pipe was put in leading from the ceiling into the stove box. Six inches of sawdust were put under the box to keep the heat from striking through to the bees. The stove was cased with fin from the top of the box to within a few inches of the rafters, leaving space enough at the back to receive a 7-inch stove pipe. The smoke-pipe from the stove is 5-inch. The heated air ascends from the zinc hox and tin casing through the vacant space in the 7-inch stove pipe. A strong draft is thus created. By graduating the fire, the temperaat will. A moderate fire will keep it at 50-a strong one will bring it down to 40. The temperature is kept at to 40°. The temperature is kept at 50° for the first two weeks after putting in the bees, and then generally reduced. If the bee-house is too warm, by putting on the draft the heat will go down one degree per hour. The go down one degree per hour. The bees are perfectly quiet, the house is dry, and there is no foul smell of any kind. Before putting in the bees, 3

kind. Before putting in the bees, 3 bushels of unslacked lime are put beneath the floor.

In reply to the objection that this plan gives trouble, Mr. W. says, "I don't find that we get much in this world without some trouble. All I have to do is to shake down the ashes night and morning and add coal. This is no more trouble than feeding one pig." The air that comes in from the long out-door vine is at all times, sumlong out-door pipe is at all times, summer and winter, at 45°. This garret heat plan is also on trial.

PARLOR WINTERING. Now for my own little experiment: I have 2 very weak colonies in my library. Each consists of a mere handful of bees. One has an Italian queen that mated with a black drone; the that mated with a back drone; the other has an Italian queen purely mated. Both are in common out-door hives, but each has a wire-cloth cage over it. A slide controls the ordinary entrance. Honey-boards are screwed down, each having a 3-ineh hole in the center, expected with wire cloth. The center, covered with wire-cloth. The theory is that bees can take exercise enough within a limited space, just as a man can take exercise enough on a verandah. Moreover, if out-door colonies can be stimulated so as to increase, why not in-door colonies? These bees have been domiciled in my library nearly a nearth. library nearly a month. I feed them through the wire-cloth opening in the honey-board. When I give them a fly in the cage, they are too intent on The thermometer is dropped through a hole in the floor near the stove, and is attached by a cord to the cover of the hole. By putting the ear to this hole he can hear a bee fly below. In warm winters it is often very difficult to keep the temperature in the honses low enough to prevent the bees becoming uneasy, with ordinary ventilators,

seems to teach that they must go out of the hive to die. One of these little colonies is the ont-come of a black nucleus into which I introduced an Italcreus into which i introduced an Italian queen Aug. 15. The bees that come out and die are all black. Not a solitary Italian has yet been found among them. I do not propose to open these hives until spring. It my theory proves sound, they will breed, increase and come out good colonies by that and come out good colonies by that time. If it proves misound, why, the bees will die—a result sure to have happened out-of-doors. Now I don't go 10 to 1 on my theory, like Mr. Heddon, but I have confi-dence enough in it to give it a trial.

If it succeeds, there need be no more doubling up of weak colonies or sacrifice of supernumerary queens in the fall. A moderately-sized room with a coal-stove kept going in it, will hold a lot of these little colonies. If, say, 50 can be nursed up from a handful, each to be a good, strong colony, it will pay handsomely, and we may devote the summer to honey-gathering, and the winter to building up nuclei into working colonies. "Too good to

and the winter to building up nuclei into working colonies. "Too good to be true?" Well, perhaps.

Artificial heat has been tried before now in various ways, but never, I think, in this particular way. Bees have been put in warm rooms, and given liberty now and then. They given fiberty now and then. They have made for the glass windows, and been chilled to death. When more than one hive has been liberated in the same room, they have, like Kilkenny cats, quarrelled and fought nntil destruction came to both or all. I set this footh when we are destruction. put this forth only as a modest experiment, and a humble effort to throw more light on the problem of wintering, but possibly I may wake up some fine morning to find myself famous, and my friend Heddon lustily blowing trumpet before me! Listowel, Ont, Dec. 3, 1881.

### Northeastern Wisconsin Convention.

The Northeastern Wisconsin Bee-Keepers' Association convened at Pewaukee, Oct. 11, at 10 a.m., and in the absence of the President and Secretary, and owing to the small number present, was not formally organized rill 3 p. m., when, in the continued absence of the President and Secretary, John Hodgson, Jr., was elected President pro tem., and T. E. Turner, Sec-

dent pro tem., and T. E. Turner, Secretary pro tem.
Question.—" Do Italians, Cyprians or black bees winter best?"
John Hodgson, Jr., said his Italians gathered impure honey last fall, and all died from the effects of it in wintering; his blacks gathered better honey, but did not have enough to run them, through the lang winter, and a

honey, but did not have enough to run
them through the long winter, and a
great many starved; his few Cyprians
wintered better than Italians.
II. P. Sayles had some black bees,
some Italians, 4 Cyprian colonies and
some hybrids. His small colonies
seemed to winter best. The Cyprians
wintered the best of all. The blacks

wintered the best of all. The blacks all died but one colony, and it became queenless late in the spring.

T. E. Turner had wintered Italians and Cyprians the past winter with but little difference in the results, all things considered, and what little difference there was was in favor of the ference there was, was in favor of the Cyprians. The percentage of loss of the two races was about the same, but the Italians were in much the best condition for winter, and should have done the best.

Mr. Wilson had Italians and hybrids; his pure Italians wintered best.

the most profitable?"

T. E. Turner had decided long ago in favor of the Italians over the black bees, and lately had tried Italians and Cyprians in comparison, and found no difference in the amount of honey gathered. He preferred the Italians for their gentleness in handling, but found the Cyprians a little more prolific and more ready to work in boxes.

H. P. Sayles found the Italians would fill the brood chamber with honey to their injury and self-destruc tion if they were let alone; and for them to give the best results the ey fractor must be used, or full combs be removed and empty ones or full sheets of foundation put in their place. thought the blacks were the best bees for the careless bee-keeper, because they would not fill up their broad they would not fill up their brood chamber with honey to their own in-He thought the honey ext ted from the Italians would more than pay for the time of extracting it, and then the Italians would gather the most honey besides. He prefers either most noney besides. The prefers either the Italians or Cyprians, but has had limited experience with the Cyprians, ret regards them favorably The Italians required more care and attention than the blacks, and he believed, taking the season through, that he could get more box honey from the blacks than the Italians, and a better quality of extracted honey.
It was resolved that the sense of

this Association is that the Italian and Cyprian bees are more profitable, all things considered, than the blacks.

Question.—" What is the cause of the great loss last winter in Wisconsin and Jacondors 2"

and elsewhere

Mr. Peffer found no young bees in the fall; the long winter and impure honey, to be the causes of the great loss last winter of all his bees.

Mr. Wilson thought we could never arrive at the cause of the great loss last winter. His bees starved to death last winter.

Oct. 12, 10 a.m. The Association was called to order by the President ro tem., and resumed the discussion of the last question.

Charles Horst thought his principal cause of loss was starvation.

II. P. Sayles thought the very early breeding in the winter was the cause of bees eating so much honey, and their starvation the result.

T. E. Turner thought his bees died the past winter from impure honey

principally.

Mr. Hodgson found his bees breeding in February, and with very little honey. He fed some on sugar candy in the cellar, and those fed all went through in good condition, and those not fed were dead, or in bad condition,

S. E. Gernon lost his bees from starvation, but could not tell the cause of their starvation, when he had

them plenty of honey in the fall.

II. P. Sayles said it was caused by a combination of circumstances, poor honey, lack of young bees in the fall, breeding in the winter. He had bees breeding in the winter. He had bees with dysentery from long confine-ment, but they got over that and he thought it was not real dysentery they He thought breeding in winter more than the poor honey caused the

great loss.

T. E. Turner found breeding early in winter very bad for bees, but considered the poor quality of honey the

cause of the great loss with him.
Question.—"Swarming out; what
is its cause, and how to prevent it?"
John Hodgson. Jr., had found no onn Hodgson, Jr., had found no way to prevent swarming out in the spring, and thought the condition of the bees in the fall had something to do in causing it. Others had but little experience with swarming out.

Question.—"What is the best way of catting Italians to nearly in Language."

Question.—"What is the best way of getting Italians to work in boxes?"

T. E. Turner put one full section in the center of section rack on top, and the Italians would go to work in them: also used section frames in the brood chamber at the side of brood, and also

used section frames in an upper story. H. P. Sayles said he kept the hives full of brood in the brood chamber by be as safely and surely wintered as a the bees may get uneasy. We then they should be allowed to swarm but extracting, and put a small piece of horse in a good stable with plenty to open the window at night and close it once. You will then have strong col-

top, and they went right to work.

Peter Peffer had Italians to work in boxes this year as well as blacks, but still had no faith in Italians for work

Question,—"What has the yield and increase of the present year been

John Hodgson, Jr., had 19 full colonies and 5 nuclei in the spring, and had taken 2,900 lbs. of honey, 750 lbs. of which was extracted. He had now 75 colonies to winter.

T. E. Turner started with 15 colonies in ordinary condition and 5 nu-clei; had 600 lbs. of comb honey, and 600 lbs, of extracted ; reared 50 queens for market, and now had 73 colonies

in good condition for winter.

II. P. Sayles had 5 muclei in the spring, and had obtained 100 lbs. of comb—150 lbs. of extracted honey and reared 100 queens.

Mr. Olsen, from 10 colonies had ta ken 1,400 lbs. extracted and 200 lbs. comb honey, and now had 30 colonies in good condition for winter.

ter Petfer, from 3 colonies took

300 lbs. box honey, and increased to 6.
William Mayhew started in the
spring with 2 colonies; took 50 lbs. of
comb and 100 lbs. extracted honey. and increased to 5.

S. E. Gernon started with 30 colonies and 6 nuclei; took 3,400 lbs. of box honey, 800 lbs. of extracted, and increased to 68.

Wilson, from 2 nuclei, took 500 lbs. of extracted honey, and increased

The following was adopted :

Resolved, That we exceedingly regret the non-attendance of the Northern members of the Association, and in view of that, and the fact that the Southern members follow it wherever held, that the next Convention be held in the Northern part of the State

The next meeting will be held at Berlin, Wis., on Jan. 17 and 18, 1882. T. E. TURNER, Sec. pro tem.

### Western Michigan Convention.

The Western Michigan Bee-Keepers' Association, held its first annual meeting at Berlin, Mich., on Oct. 27, President Wm. H. Walker in the

New members were received, increasing the number to 31, including S ladies. The constitution was amended, to have a Vice President elected each county represented in the Association.

The following officers were elected for the ensuing year: President, Wm. 11. Walker; Secretary, Wm. M. S. Dodge, Coopersville; Treasurer, Mrs. Jennie Walcott, Berlin; Vice Presidents—for Kent Co., Henry Holt, Cascade; Ottawa Co., J. J. Robinson, Lamont; Muskegon Co., Geo. C. Young,

Ravenna.

The following address by Dr. E. P. Cumings, of Grand Haven, was read:

### Wintering Bees.

When we look back and see what a wholesale slaughter of the bees there was all over the country during last winter, I think there is no question of so much importance, or that comes home so forcibly as this. What I have written are my honest conclusions, rived at from experience and study. have kept bees for the last 12 years Took it up for an out-door pastime, and have made it quite a study and have made it quite a study. Have had from 3 to 30 colonies. Being able only to attend to few, I have disposed of some each year, but during all this time I have never lost a colony in winter, and my experience convinces that it is unnecessary and cruel

This may seem like a sweeping This may seem the a sweeping statement, and to many who are sore over losses, uncharitable; but nevertheless, I believe it is true. What would you think of a man who had no burn for his horses or cattle, and left them out-of-doors to shift for them-selves in our northern winters? You might as well expect them to winter unprotected, as for bees, and bees can

Question.—" Which race of bees is broad or eggs in the section rack on eat, a good blanker, and suitable bed- in the morning, when the bees will be ding. Many Many persons engage in busi-ithout sufficient information regarding it; in other words, without "learning the trade," and such must fail; they always have bad luck.

I have known persons engage in fruit-culture or gardening, and get good trees or seeds, but let the sun good trees or seeds, but let the sun shine on the roots and not plant their seeds properly, and after planting they think all they have to do is to reap the harvest. Their garden and they think an they have to do is to reap the harvest. Their garden and orchard grows up to weeds—their trees are killed by borers, and they have had "bad luck." Such will not do in our days. The price of success in every thing is "eternal vigilance." There are enemies to light, and the elements to combat, in all branches of elements to compat, in all branches of industry, and he who is best posted and most diligent, will succeed the best. "The slothful shall not eat the good of the land."

There are occasionally winters when bees will winter safely out-of-doors without protection, but even those winters they are much better off for protection, and winters are so uncertaint that it is not safe to risk thought tain, that it is not safe to risk them at all. They will commence raising brood earlier in the spring, come out stronger, and consume less honey stronger, and consume less when protected, than otherwise.

Many are ignorant of the cause of bees dying in winter when they have nees dying in winter when they have plenty of honey in the hive, and they think the honey was bad, or that they froze up entirely. They would think it impossible for bees to starve with plenty of honey in the hive. Never-theless, in most cases this is the fact. In very cold weather the bees cluster together in the smallest possible space where the combs are empty, as they can pack in closer there; and if it con-tinues cold for some days, the combs outside the cluster become covered with frost and ice from the breath of the bees. They can not live long without honey to eat, and some brave fellows start out for it. They step refellows start out for it. They step upon the frosty combs, and in a minute they are chilled and unable to return, and soon fall to the bottom of the hive, dead. Others follow and share the same fate, till at last the workers have all perished in their attempts to bring honey to the queen. who finally shares the common fate. Do they not starve? and if so, who is to blame? Is it not those who should care for and protect them? I say they are just as much as though they had starved their horse or other animals.

But, I fancy I hear some one say we are ignorant, and the sin of ignorance is winked at. Well, if people can get any comfort out of that, they have not an enlightened conscience; but it is pretty dear winking, and they will have to do much of it to restore their wasted funds, or bring their dead bees to life again.

Many ways of wintering bees are

recommended by different writers and bee-keepers. Packing them with chaff or other material, on their summer stands; in a house made for the pur-pose, above ground, the sides, floor and ceiling of which are packed; also in a good cellar. I believe a good, dry, dark, cool, well-ventilated cellar, free from rats and mice, the best possible place to winter them. It should be kept as near the freezing point as possible, and not freeze. It is not nec-essary to have a cellar exclusively for them, unless you have a large quantity. I have always kept mine in the cellar where we have kept all our vegetables, and where we go many times a day for them. I have a strong shelf about 4 or 5 feet from the bottom of the cellar, on which I put the hives close together, with a curtain of old carpet hung in front, a little lower than the shelf, so that when we go in the cellar the light will not affect them. At other times, the cellar should be kept perfectly dark. We have a thick, dark curtain at the window, which we drop when we go down, and hang up when we come up again. The window can also be opened if it gets too warm, in case of a thaw, when the bees may get uneasy. We then

found quiet.

One of the great advantages of a

cellar over other methods, I believe to be, that it is not readily affected by slight thaws, or changes of tempera-ture. The shelf upon which they are ture. The shelf upon which they be put should not, if possible, rest on the floor, or hang to the joists above, if the possible and the the room over is occupied and the cellar is one you often go into, for the noise and jarring would disturb them, but fasten it to the wall. Care should be taken not to jar the shelf when going in the cellar.

They should not be put into winter

quarters till winter has set in for good. Let them have a day or two of it, and if you see it has really set in, put them it you see it has really set in put them in. Carry them in your hands as carefully as possible, leaving the top of the hive on the summer stand, or not as you like (I have mine out), then before putting them on the shelf, give them a little top ventilation by opening a synce agrees the frames and a guilt space across the frames, and a quilt about the size of the top of the hive over all. That gives enough ventila-tion without letting off too much warmth, while the little stick across the frames keeps the quilt up, so that the bees can crawl from one frame to another. Always leave the fly holes open at the bottom, for they will become uneasy if they find they are con-

They should be carried in when cold and put in place as quietly and quickly as possible and the cellar made dark, and they will soon become oniet and remain so all winter, unless is unusually warm; then if you cannot quiet them, take them out on a warm day and put them on their summer stand, and give them a fly. turns cold again, carry them back in the cellar as before.

Mine were in 4 months last winter without a fly, and after I carried them out about the middle of March, I put them back and kept them a few weeks longer. They may become too warm and uneasy unless you take them out and give them a fly, and will discharge their feces over the hive and on the combs, which makes bad work, and people will say they have the dysentery when it is only natural. While they are kept quiet they do not disthey all empty themselves, and are then all right. If you don't want them to "have the dysentery," keep them cool and quiet.

I have spoken only of frame hives some will say, what shall we do with our box hives, gums, etc.? Treat them the same way, as far as you can, but any one who expects to succeed with bees must have a movable frame with bees must may a morning thive, in order to always know what condition they are in. I do not mean condition they are in. I do not mean you must buy any patent-right. I am not much of a favorite of patents, and there are plenty of good hives without buying worthless patents. Some still cling to the old box hives, because

their fathers used them.

There was an old gentleman who lived near me who thought he knew it all, and gave me a good deal of advice, and of course I could not inform him any, for he had always kept bees, and his father and grandfather before him had kept them, and he understood all about it. He did not like the newfangled notions; preferred the old-fashioned gums or box hives, but thought a hollow log the most natural and best, and actually put some in one. I could not convince him that the queen was not the "king bee," or that the queen came out with the first swarm always; but he did finally put his bees in the cellar, after he saw that mine wintered so much better than his, but he thought it necessary to go and stir them up once in a while during the winter, and consequently his bees "had the dysentery;" but the poor old man has now gone to his final

rest, as have also his bees.

If you wish bees to winter well or do well, and be profitable at all times, keep them strong. In this climate, where the honey season is so short, they should be allowed to swarm but

onies that can at all times defend onnes that can at an times determines themselves against robbers or millers, and will go into winter quarters strong, and give you good returns in surplus honey.

There is no disease that is one hundreth part as destructive to our little rate as is our negligence, in not are

pets, as is our negligence in not providing winter protection for them, and if we need any legislation in regard to them, it seems here is where it should begin. Make it a criminal offense for any one to keep bees unless he is com-petent, and not shiftless enough to neglect them.

The Secretary read from a letter from T. F. Bingham, of which the following is an extract: "I am raising the combs 1½ inches from the bottom to allow the accumulations of dead

to allow the accumulations of dead bees, should long cold occur as last winter."

J. J. Robinson thought this a very good plan. He would make a frame 2 inches high to fit under the hive on bottom board. He did not think bees froze to death. A colony in his neighborhood wintered well unprotected in a rold box hive with a wile crack in an old box hive with a wide crack in the side, while other bees were almost a total loss. Several instances of this kind were given.

Two men living A. A. Dodge. Two men living about 12 miles apart, have kept 30 or less colonies each in the box hives, wintering on summer stands. One wintering on summer stands. One who has been very successful in wintering, makes a fly-hole in his hives about 6 inches above the lower entrance. The other man does not; had lost nearly all his bees this last winter. He had known a man who for years successfully wintered bees by putting a piece of brick under each corner of his hives.

Whi, H. Walker had found a bee frozen in ice and throwed it out, and in half an hour it flew away.

Henry Holt said he had come to

in half an hour it flew away.

Henry Holt said be had come to learn how to winter bees. When he lived in New England, bees wintered without care, but times had changed. He thought ventilation important. He had tried wintering in a cellar, but thought it a good deal of trouble to carry them in and out.

Walter Hastings thought successful

Walter Hastings thought successful wintering depended on a few simple conditions: Keep them dry; give them ventilation enough, but not too them ventilation enough, but not too much. He thought it was not easy to freeze bees, as they would maintain the warmth of the cluster in the coldest days. He described his method of packing with chaff; by removing a piece in the front of the hive, he could clean dead bees from the bottom board, should they accumulate.

A. A. Dodge spoke of cutting passage ways through the combs.

E. Miner said that last winter he used a room above the cellar, in which his bees were kept; many bees died; his bees were kept; many bees thet; stopping the entrance caused uneasi-ness. He wished to know if noise disturbed bees. It was thought bees were disturbed more by jarring than by noise.
Walter Hastings thought confine-

ment in a cellar unnatural; if cold will not kill bees, why put them in

cellar? Wm. II. Walker said that wild bees Wm. II. Walker said that wild bees did not die from cold, yet cold was the real cause of loss, as with frosty combs, they would starve when honey was close by. He thought the great object of wintering in cellar was to save honey, by an even temperature.

The members were about equally divided in favor between chaff packing and a good cellar.

ing and a good cellar.

F. S. Covey said that last year he had 2 colonies which had been queenless for a time, allowing hee-bread to accumulate in the combs; in early winter they were severely attacked with dysentery. They were good col-onies, had good queens, plenty of honey and young bees, the honey being mixed with bee-bread.

J. Precious gave similar experience.
Question: Which is best, artificial or natural swarming?
A. A. Podge said both, according to girgumstance.

circumstances.
Wm. II. Walker thought it depended on the man.

bee-keeper must dispose of his bees, or keep them in until the fruit was out of the way. He was threatened with prosecution by one of his neigh-bors (a grape grower), and would have to give up keeping bees, or stand a law suit.

Question: Shall we advise our friends to go into bee-keeping, or is the business over-crowded? The general opinion was that the market had improved as fast as the supply had increased.

The meeting adjourned, to meet in the city of Grand Rapids, on the last Wednesday and Thursday of April, 1882. WM, H. WALKER, Pres.

WM. M. S. DODGE, Sec.

White Pine Honey Package.—If we take white pine and make a box or barrel to hold honey, and then seald out this box or barrel before we put the honey in, will the honey taste of the pine? I had 43 colonies last fall, lost 3 by backward spring, and now have 17. Most of them came through weak last spring. It was so dry here this summer that I did not get much honey—about 150 lbs. of extracted and 70 of each —I like the Ber JOURNAL 70 of comb. I like the BEE JOURNAL very much and always look for its appearance. C. F. STURTEVANT. Port Jefferson, N. Y., Nov. 28, 1881.

[If well scalded the honey will not taste of the pine.—Ed.]

Shipping Bees,-1. How many colosimpling nees.—1. How many colonies of bees can be shipped in one car?
2. Can bees be shipped as safely in the fall as in the spring?
3. What is the cost of freight on a colony of bees were 100 miles?

1. How many colonies. per 100 miles? 4. Have any of the readers of the Bee Journal used W. T. Phelps' foundation machine with necess? A. R. Paterson. Sheridan, Mich.

[1. One car will hold 150 to 225 colonies, according to size and style of hive; 200 one-story Langstroths is a very good car-load,

2. We prefer early spring for shipping; but it is perfectly safe in the fall, if not delayed till too cool to give the bees a good flight immediately afterward.

3. Where shipped in lots, as freight, for any considerable distance, somewhere between 15 and 25 cents.

4. We do not know.—ED.]

Bee Stings for Rheumatism.—I had about 38 colonies in the spring; 5 had old queens, which were superseded by young ones in the summer, and they only gathered about enough honey to carry them through this winter. The 33 with young queens done well and swarmed well. I sold 4 colonies for \$7.50 each, and have put 61 in the cellar, all in good condition, with plenty of honey to last them through a hard winter, and not one queen over 2 years winter, and not one queen over 2 years winter, and not one queen over 2 years old next fall. I bought I Italian and 2 Cyprian queens. I lost one of the latter last winter; the other tried to make good the loss, and gave me 7 natural swarms. I thought it would swarm itself to death; I opened the hive and took out 8 or 10 queen cells, telling them not to swarm any more. This fall, to my surprise, I found the hive crammed full of honey. I had another colony that would swarm whenever another swarm came out

and hot and the bees could gather but little, after which the season was wet and poor. Regarding the bee-cure for rheumatism, the following case came 1. I. Robinson said it was claimed by some fruit growers that bees in-jured fruit, and that in such cases the under my notice: Mr. John Rohl, of this place, came to me and wanted me this place, came to me and wanted me to let some of my bees sting him in the arm. I told him all right; I would not charge him anything; if it cured him I would have it put in the papers. So he rolled up his sleeve, and I gave him 8 or 9 stings on the elbow and arm-pit, which would make him jump as I took the bees by their wings and let them stick their language in his as f took the bees by their wings and let them stick their lancets in his fleshy parts. About 4 weeks after I saw him and asked him about the cure; he said he was all right now, and swung his arm to show how limber it was; the swelling had all gone down. He said in Germany they always cured the rheumatism in that way, and he appeared well satisfied with the job. THOMAS LASHBROOK.

Waverly, Iowa, Dec. 3, 1881.

High Temperature in Cellars.—Beebread seems to be all the talk with some of the Bee Journal writers on the wintering problem; but I do not think it the cause of the trouble. The high temperature of many of the cellars is probably the cause. The temperature in the hive will be from 15- to 26° above the cellar, so that the bees are able to breed. The honey crop was good in this section. We are very much pleased with the Weekly Bee Journal; you may consider me a life subscriber. W. 11. Mallory. Worcester, N. Y., Nov. 29, 1881.

Honey Show Burned.—At the Kansas City Exposition, the honey show was all burned up in the main building. My loss was about \$20 in honey and fixtures. The honey crop was about one-third with us. I had 47 colonies in the swing, out of 49 the fall and fixtures. The noney crop was about one-third with us. I had 47 colonies in the spring, out of 49 the fall previous; increased to 55; took 400 lbs. of comb honey and 300 lbs. of expensions of the spring of the tracted, which I sold at 22½c, for the comb and 15c, for the extracted, at wholesale. Bees have been flying some for the last four days.

JAS. A. NELSON.

Wyandott, Kans, Nov. 30, 1881.

Changing Location of Cluster in Winter.—During a continuous cold spell of weather I have adopted the following plan, with success, for warming the interior of the hive and giving the bees an opportunity to change their location from empty to full combs: I take two or three bricks that are not hard burned, put them on the fire and heat them till there is no steam arising from them; now take them from the fire, and let them cool till you can the fire, and let them cool till you can pick them up with your hand, lay them right on top of the quilt on the tops of the frames; now put your chaff cushion down, and close all around snug. By this plan the hive will keep warm 6 or 7 hours; the heat passes off so slowly that the bees will all cluster nicely. After the bricks cool, they will absorb the moisture the bees generate. The bees will not attempt to fly out, but will carry the dead bees out on the alighting-board, if there are any. The plan works like a charm.

J. S. Hoffman.

Madisonville, O., Dec. 3, 1881.

Madisonville, O., Dec. 3, 1881.

Selling Comb Honey for Cash.—I have been a constant reader of the BEE JOURNAL for the last 5 years, and have during this time been in the bee business. My section is one of abundant yields, and the greatest question with me has been selling honey in large quantities for cash. I wrote my brother, Rufus Morgan, at Columbus, Wis., some time ago, that I was much interested in the BEE JOURNAL of late, as it was working up the question of the sale of loney for cash, and doing much to make it a staple article. I give you below his ideas of the cash value of comb honey. I will further state that he produced the past season over 15,000 lbs, of comb honey, all white; I think he made no report to any paper in regard to bees or croptals or the cash could be seen as the last will perfect them. another colony that would swarm whenever another swarm came out near by, and go right in, and sometimes would go back to their own hive; they would come out 2 or 3 times a day, and were always ready to swarm. They done very well considering the season, the first part of which was very good here; then it became dry

give valuable experience, if he would. He has disposed of his whole crop for cash, and I am aware that he got 20c. per lb. right through, and a little at 22c. I quote a part of his letter without his knowledge: "Now, in regard to the bee business, I would say that the marketing of honey for cash, in large quantities, has no terrors for me, as we have shipped over \$1,500 worth this fall with entire satisfaction, and it is much easier to ship than eggs or live stock, and just as ready sale as it is much easier to ship than eggs or live stock, and just as ready sale as wheat. I would write you all about how to ship it, but I know you have not enough to pay to go on and make shipping crates this fall; but I would say that the great question in this business is, flow can the most white honey, in marketable shape, be produced with the least labor? That is the only question that bothers me in the least. We have overcome all other difficulties in this business, I think, and that one, also, to a certain extent." and that one, also, to a certain extent.

E. A. Morgan.

Arcadia, Wis., Dec. 1, 1881.

The trouble is not so much in selling, as in getting a nice article to market in presentable shape. As all are more or less interested in this subject, we hope Mr. Rufus Morgan will give our readers the benefit of his experience.—Ep.1

Wintered on Summer Stands.—I have 58 colonies of bees on summer stands; 26 of them are in empty boxes without packing; the rest of them have the upper story on, with frames and combs. I use the simplicity live.

J. Chapman. Home, Mich., Nov. 28, 1881.

The Nebraska State Bee-Keepers' Association will hold its annual meeting in Ashland, Neb., on the 12th and 13th of January, 1882. A cordial invitation is extended to all who are interested in bee-culture.

T. L. VONDORN, Pres., Omaha, G. H. HAWLEY, Sec., Lincoln.

The South Eastern Michigan Bee-Keepers' Association, will hold its annual meeting at the Court House in Ann Arbor, on Thursday (and per-haps Friday), commencing Dec. 15, 1881, at 10 a.m., for the election of of-laws for the assigns were and each ficers for the ensuing year, and such other business as may be brought before the Association. A good attendance and interesting meeting is expected. Several subjects of interest will be discussed by able men.

N. A. PRUDDEN, Pres.
G. J. Pease, Sec. pro tem.

The eastern New York Beekeepers' Union Association, will hold their ninth Convention. Tuesday, Jan. 10, 1882, at 10 o'clock, at Central Bridge, Schoharie Co., N. Y.
W. D. WRIGHT, Pres.
N. D. WEST, Sec.

### Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per t00.

Articles for publication must be written on a separate piece of paper from items of business.

.... Photographs of prominent Apiarists—Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each.

When changing a postoffice address, mention the *old* as well as the new address.

Those who may wish to change from other editions to the Weekly,can do so by paying the difference.

Constitutions and By-Laws for Associations \$2.00 per 100. The local Associations \$2.00 per 100. name of the Association printed in the blanks for 50 cents extra.

The Color and Lustre of Youth are restored to faded or gray hair by the use of Parker's Hair Balsam, a harmless dressing highly esteemed for its perfume and parity. perfume and purity. 49 w 4

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city excent at a disagram of 25 cents, to pur except at a discount of 25 cents, to pay expense of collecting them.

Rheumatism is the most terrible disease that has ever afflicted humanity, yet it instantly yields to the powerful drugs that Kendall's Spavin Cure is composed of.

😝 It would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—Also, if you live near one postoffice and get your man at another, be sure to give the address we have on our list.

It will pay to devote a few hours in getting up a club for the Bee Journal. Read the list of premiums on another page, and take advantage of the fall gatherings to get up clubs.

It is Worth Remembering that nobody enjoys the nicest surroundings if in bad health. There are miserable in bad health. There are miserance people about to-day with one foot in the grave, when a bottle of Parker's Ginger Tonic would do them more good than all the doctors and medicines they have ever tried. See adv. 49w4

We have a SPECIAL EDITION of the Weekly Bee Journal, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

Premiums.—Those who get up clubs for the Weekly Beig Journal for 1882, will be entitled to the following premiums. Their own subscription may count in the club;

For a Club of 2, - a copy of "Bees and Honey," a copy of "Bees and Honey,"
4.—an Emerson Binder for 1882,
4.—Cook's (Bee) Manual, paper,
5.—

6.-Weekly Bee Journal for 1 year,

Or they may deduct 10 per cent in cash for their labor in getting up the club.

We are sometimes asked who our authorized agents are? Every subscriber is such an agent; we have no others, and greatly desire that each one would at least send in one new subscriber with his own renewal for 1882. The next few weeks are the time to do this. We hope every subscriber will do his or her best to double our list for 1882. our list for 1882.

W. Illinois and S. W. Wisconsin Bee-Keepers' Association, will be held in Temperance Itali, Freeport, Stephenson Co., Ill., on Jan. 17 and 18, 1882.

JONATHAN STEWART, Sec.

🕼 The Indiana State Bee-Keepers Association is called to meet in annual session, Wednesday and Thursday, Jan. 24 and 25, 1882, in the rooms of the State Board of Agriculture. By order of Executive Committee.

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, Monday, 10 a, m., Dec. 12, 1881,

The following are the latest quotations for honey and beeswax received up to this hour:

### CHICAGO.

HONEY—The market is lively and prices steady. We quote light comb honey, in single comb oxes, 18@22c; in larger boxes 2c, less. Extracted

BEESWAX-Prime quality, 18@22c. At. II, Newman, 972 W, Madison St.

#### NEW YORK.

HONEY—The supply is full, and trade is lively. We quote as follows: White comb, in small boxes, 18-622; dark, in small boxes, 15-6 [7c. Extracted, white, 16-6-11c.; dark, 76-9c. BEESWAX.—Prime quality, 21-9-623c. THORN & CO., 11 and 13 Devoc avenue.

### CINCINNATI.

HONEY—Is in good demand here now.
I quote: Good comb honey, in sections, is worth
18620c, on arrival. Extracted, 7630c, on arrival.
BEESWAX.—18622c, on arrival. I have paid
25c, per lb. for choice lots.

C. F. MUTH.

#### BOSTON.

HONEY.—1-pound combs are a desirable pack-ge in our market, and a large quantity could be old at 28622c, according to quality. BEESWAX—Prime quality, 25c. CROCKER & BLAKE, 57 Chatham Street.

### BALTIMORE.

HONEY .- But little on the market, and prices are not quoted.

BEESWAX.—Southern, pure, 21@23c.; Western, pure, 21@22c.; grease wax, 11c.—Baltimore Market Journal.

### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb. sections, 22@25c. diamapolis Stock Review.

### PHILADELPHIA.

HONEY.-The supply and demand are alike nominal. BEESWAX — Best light 23@25c,—Philadelphia Merchants' Guide.

### CLEVELAND.

HONEY—Our market for choice white honey in 1 lb, unclassed sections continues very active at 22c; 2 lb, unglassed at 2002[c], buckwheat rather slow at 18c. Glassed sections would have to be sold 364c, per lb, less. Extracted selling slowly at 8010 aggre, p. . 12c, per lb. BEESWAX—18@20c. A. C. KENDEL, 115 Ontario Street.

### SAN FRANCISCO.

HONEY-Receipts for the week over 7(0) cases. A little more inquiry is noted, but sales at extreme figures continue to be the exception.
We quote white comb, 166220c; dark to good, 106
14c. Extracted, choice to extra white, \$342010c; dark and candied, 76cc. BEESWAX-230c 25c.
STEARNS & SMITH, 423 Front Street.

#### ST. LOUIS.

HONEY.—In larger (but poor) supply, and steady; comb at 18@22c.; strained and extracted, 9@ lic. to 12½c.—top rates for choice bright in prime packages.

BEESWAX—Selling lightly at 19@20c.
R. C. GREER & CO., 117 N. Main Street.

Will be sent to any address one year for only thirty cents. We club with the Weckly American Bee Journal for only \$2.15. Sample copies free. Address, SCOVELL & ANDERSON, 2swif Columbus, Kansas.

# The Bee-Keeper's Guide;

MANUAL OF THE APIARY, By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, diustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shribs, etc., splendidly illustrated—and list, though not least, detailed instructions for the various

manipulations necessary in the aparry.
This work is a masterly production, and one that no bec-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

Read the following opinions of the Book;
All agree that it is the work of a master and of real value.—E. Apautlure, Paris.
I think Cook's Mannal'is the best of our American works.—LEWIST. COLDY.
It appears to have cut the ground from inder future book-makers.—British Bee Journal.
Prof. Cook's valuable Manual has been my constant guide in may operations and successful management of the apary.—J. P. WEST.
I have derived more practical knowledge from Prof. Cook's New Mannal of the Apary than from any other book.—E. H. WYNKOOP.
This book is just what everyone Interested in

any other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having putenased.—Mich. Fur.

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Montrello, Ill.

exhaustive work.—Herald, Monticello, 1ll.

With Cook's Manual I am more than pleased. It is findy up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

My success has been so great as to almost astonish myself, and much of it is due to the clear, distincted information contained in Cook's Manual.—Will VAN ANTWERP, M. D.

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—Ky. Law Stock Record, It is a credit to the author as well the publisher.

value to all bec-raisers.—Ky. Lew Stock Record.
It is a credit to the author as well the publisher.
I have never yet met with a work, either French
or toreign, which I like so much.—L'ARBE DU
BOIS, editor of the Bulletin D' Apiculteur, France.
It not only gives the natural history of these industrious insects, but also a thorough, practical,
and clearly expressed series of directions for their
management; also a botanical description of honey
producing plants, and an extended account of the
enemies of bees.—Democrat, Puluski, N. Y.
We have perused with great because this and

producing plants, and an extended account of the enemies of bees.—Democrat, Puluski, N. Y.

We have perused with great pleasure this wide mecan of the bees keeper. It is repliete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, rend it carefully and practice as advised.—Agriculturis, Quebec.

This book is pronounced by the press and leading becamen to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee man will welcome, and it is essential to every manetur in becompliated. It is bandsomely printed, nearly bound, and is a credit to the West.—Western Agricularist.

This work is undoubtedly the most complete manual for the tostruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the aparry. There is no subject relating to the culture of bees left unforched, and in the complation of the work Prof. Cook has had the advantage of all the previous knowlede of aparrists, which he uses admirably to promote and make popular this most interesting of all occupations.—American Inventor.—

THOMAS G. NEWMAN,

974 West Madison Street, CH1CAGO, ILL,

Bee-Keeper's Guide; or, Cook's Manual of the Aprary. — Entirely re-written, elegantly illustrated and felly "up with the times" on every subject of bee-culture. It is not only instructive, but intersely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, §1.25; paper cover, §1,

Quinby's New Bec-Keeping, by L. C. Root— The author treats the subject of bec-keeping so that it cannot fail to interest all. Its style is plan and forcibe, making all its readers realize that its author is master of the subject,—\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root

-This entraces 'everything pertaining to the care
of the honey-bee, "and is valuable to beginners and
those more advanced. Cloth, \$1.25; paper, \$1.

King's Bee-Keepers' Text-Bonk, by A. J. King. This cultion is revised and brought down to the present time. Cloth, \$1.00; paper, 75c.

Langstroth on the Hive and Honey Bee.
This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.— A romance of bee-keeping, till of practical information and contagnous enthusiasm. Cloth, \$1.00.

Hees and Floney; or, successful management of the Aplacy, by Thomas G. Newman.—
The Aplacy of Thomas G. Newman.—
The Appary—Honey Plants—Queen Rearing—
Feeding—Swarning—Dividing—Transferring—
Hailanizing—Introducing Queens—Extracting—
Quieting and Handling Bees—Marketing Honey,
etc. It is published in English and German.—
Price for either edition, 40 cents, postpaid.

Delegan Theory: -presents the fundamental principles of live-culture, and immishes the facts and arguments to demonstrate them. 15 c.

facts and arguments to demonstrate them. 15 c.

Honey, as Food and Medicine, by Thomas
G. Nowman.—This pamphiet discourses upon the
Ancient History of Bees and Honey, the nature,
quality, sources, and preparation of Honey for the
Market; Honey as food, giving recipes for making
floney Cakes, Cookies, Puddings, Foam, Wines, etc;
and Honey as Medicine with many useful Recipes.
It is intended for consumers, and should be accutered by thousands, creating a demand for honey
everywhere, Published in English and German.
Price for either edition, 9c.; per dozen, 50c.

Wintering Recs. - This contains the Prize Essays on this subject, read before the Centennual Bee-Keepers Association. The Prize-\$5 in gold -was awarded to Prof Cook's Essay, which is here given in Inl. Price, 1 Ge.

The Hive I Use-Being a description of the hive used by G. M. Doolittle. Price, Sc.

Extracted Honey: Harvesting, Handling and Murketing.—A 24-page pamphlet by the AC. P. Dadant, giving in detail the methods and management adopted in their apary. This contains many useful hints.—Price 15c.

Practical Hinfs to Bee-Keepers, by Chas. F. Muth. 32 pages. It gives Mr. Muth's views oo the management of bees. Price, 10c.

Food Adulteration; What we eat and should not cat. This book should be in every family, and ought to create a sentiment against adulteration of tool products, and demand a law to protect the onsumer against the numerous health-destroying adulterations offered as food. 20 pages 66c.

adulterations offered as food. 200 pages ove.

Moore's Universal Assistant, and Compicte Mechanic, contains over 1,000,000 Indusdustrial Facts, Calculations, Processes, Trafe. Socrets, Logal Hems, Business Forms, etc., if vast utility to every Mechanic, Farrier and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Emineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurists, Assayers, Pombers, Gas and Steam Fitters, Bronzers, Gideers, Metal and Wood Workers of every kind.

The work contains 1,000 pages, is a verifiable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Kendall's Horse Book, -No book could be more useful to horse owners. It has 35 engravings dilustrating positions of sick hoses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses and much valuable horse information. Paper, 25c.

Ropp's Ensy Calculator.—These are bandy tables for all kinds of merchandise and interest. It is really a lighting calculator, well bound, with slate and pocket. Cloth, \$1.; Morocco, \$1.50.

Chicken Cholera, by A. J. Hill, --A treatise on its cause, symptoms and cure. Price, 25c.

974 West Madison Street, CHICAGO, ILL.

### TIN PAILS FOR HONEY.

These Pails have a full cover, and are excellent for marketing Cunded Honey. The gallon and half gallon pails have a bail or handle, the quarts and pints have none.

Assorted samples of the four sizes, put inside one another as a nest, price 30 cents. These pails are very useful for many other purposes, after being emptied of the honey by consumers. The following are the prices:

Per Doz. Per 100

### COLORED LABELS.

I now have on hand two sizes of Colored Labels for these tin pails (one size tor pints and quarts and another for balf-gallons and kallons), and can supply any quantity of either size, by mail, post-paid, at leant each. When 1800 or more of either size is ordered, I will print your name and address on them without extra charge. Prices for larger quantities than 200 given upon application.

#### TERMS OF SUBSCRIPTION:

WEEKLY-(52 numbers) \$2 a year, in advance Three or Six Months at the same rate.

SEMI-MONTHLY—The first and third numbers of each month, at \$1.00 a year, in advance.

MONTHLY-The first number of each month, at 50 cents a year, in advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sumple copies furnished free.

Remit by money-order, registered letter, express or bank draft on Chicago or New York, payable to our order. Such only are at our risk. Checks on local banks cost us 25 cents for collecting.

Free of postage in the United States or Canada Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

### Hints for a Beginner.

Mr. W. D. Smyser, Nineveh, Ind., under date of Dec. 9, writes that he has three colonies, partly prepared for winter, and wants the best method of treatment at this late date. He asks, "Ought bees to roar if they are all right? I have one colony that I can hear roar in the gum down through two feet of chaff. Will it do to look at them in cold weather? Must they be kept shut up during the cold days of spring?"

If weather is warm enough to allow the bees to fly freely, the following will be the best course to pursue: Construct a box six inches larger each way than the hive; put in about four inches of chaff; cut a hole in the side opposite the entrance; set the hive in the box, and put in a wooden tube to connect the entrance with the hole in the side of the box, to allow the bees to go in and out at all times, and to supply fresh air; pack chaff inside the box around the hive; remove the cover of the hive, and spread two or three thicknesses of old gunny cloth, carpet or drilling over the bees, fill up the box, over the hive, with chaff, put a cover on the box to keep out rain and snow, replace where the hive formerly stood, and the work is done.

as any, will be to stand cornstalks around each hive, being careful to turn over and bind the tops, to keep all dry inside. Great care must also be taken to part the stalks at the foot, opposite the entrance of the hive, to afford an opportunity at all times for an unobstructed flight.

In the methods advised above, we make no recommendation regarding the interior of the hives, for, with the season so far advanced, and the liability of a change in the weather from one extreme to another at any moment, any unusual disturbance of the cluster will be attended with risk, and no plan should be attempted which cannot be accomplished without the knowledge of the bees. Bees should not be "looked at" nor otherwise disturbed in cold weather, and should be left with their winter preparation till settled weather in spring. The entrance should never be entirely closed, and should it become closed with dead bees, they should be gently drawn out with a bent wire.

In view of the advanced season, the unusually favorable weather heretofore experienced, the general prevalence of an abundance of good, wholesome honey, and with our present impression regarding the remainder of the winter to come, with strong colonies of bees, we should experience but little uneasiness even though we had been wholly derelict in preparing them for a long, cold siege; and we would not be at all surprised if the majority of loss this winter was the result of well meant, but injudicious kindness, in contracting too much and packing too warm, thereby causing restlessness, or inducing flights when the temperature of the atmosphere would not justify it. Up to this date (Dec. 16) the winter has been unusually propitious, the bees have had numerous flights at favorable intervals, and indications of dysentery or other disease are very rare.

The roaring referred to by our correspondent, is occasioned by packing too warm, obstruction of entrance, or jarring and frightening the bees, and is very unfavorable.

After New Year's day, moneyorders are to be exchanged between facilitate commerce.

Honey as Medicine. On page 402, may be found a recipe for Cough Syrup, from Dr. Tinker, who says it may not be advisable to introduce any medicinal matter into the BEE JOUR-NAL. We think otherwise, however, for we believe that pure honey is not only excellent food, but invaluable as medicine. The Doctor says:

" Much of this preparation has been used here with highly satisfactory results, and it has been the means of selling several gallons of extracted honey." honey

We have sent the Doctor a copy of our pamphlet on " Honey as Food and Medicine," which we are pleased to know has done much to popularize honey as medicine as well as food in many localities.

How to get the Weekly Bee Journal free of cost for ISS2.-Until further notice, any subscriber who desires to obtain a good book on apiculture, can have either Cook's Manual, Quinby's New Bee-Keeping, or Novice's A BC, bound in cloth, postpaid, and the Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, or Blessed Bees (a romance), bound in cloth, for \$2.75. The JOURNAL and all five books for \$6.00. This is a rare chance to get a good library on beekeeping. A person can sell the books for their published price, \$6.00, and get the Weekly BEE JOURNAL free for his trouble.

Those having already paid for the Weekly BEE JOURNAL for 1882 may send for the books alone and deduct the \$2 already sent for the JOURNAL.

If any numbers of this years' BEE JOURNAL have been lost, look them over at once and send us a Postal Card stating the missing numbers and we will send them free, as long as we have any left.

Binders cannot be sent to Canada by mail-the International law will not permit anything but samples of merchandise of less weight than 8 ounces. Canadians will please remember this when ordering Binders.

😰 Look at the wrapper label and see that proper credit is given for the United States and the Australian money sent us, within 2 weeks. If it colonies. The change will greatly does not then appear, please send us these to our new Premium List for a Postal Card, and we shall with pleasure make the correction, for an The BEE JOURNAL of next year error may occur during the rush at If the weather be very cold the will be stitched, the edges trimmed, this season, though we endeavor to be quickest, and perhaps as safe a plan and each number will have 16 pages. | careful to always give proper credit. | completed.

Dooliftle's Chib List, and Catalogue of strawberry and raspberry plants, grave-vines, potatoes, etc., is received. It is printed by Mr. A. I. Root, and makes a very creditable appearance. Mr. Doolittle states that he has been engaged by us to write 20 articles during the year 1882 for the AMERI-CAN BEE JOURNAL, and adds :

The Weekly American Bee Jour-NAL for ISS2 will contain 16 pages of 3 columns each, which enlarges it one-third, as well as securing for it a more attractive form, thus making it more valuable than in 1881, and plac-ing it at the head of all bee journals in the world. As friend Newman prefers to have the BEE JOURNAL omitted from all clubbing lists, we have left it out. However, if you wish to send your subscription to us, when sending for other papers, we will forward the \$2 to Mr. Newman free of charge.

On the American Bee Journal and Gleanings Mr. Doolittle can make no deduction. On all other bee papers the price is "cut," more or less. We do not approve of the practice, and, sooner or later, it must be abandoned by all papers that are worth their subscription price. Any deduction given to an agent, is intended to pay for the time and trouble of procuring the club, and should never be used to ' undersell" the publisher:

The Apiary Register will be ready to send out early in January.

It devotes 2 pages to each colony, embracing between twenty and thirty headings, neatly ruled and printed, with space at bottom for remarks, and so arranged that a single glance will give a complete history of the colony. Each book will also contain printed rules for the apiary, and twelve pages ruled and printed for an apiary cash account. As each book is intended for a several years' record, it is gotten up on first class paper, and strongly bound in full leather covers. There will be three sizes, sent postpaid, at the following prices:

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones to procure at the start. We have added getting up Clubs for the BEE JOUR-NAL, as will be seen on page 407.

Send in your orders at once, and the books will be forwarded as soon as

For the American Bee Journal.

### Mr. Heddon and "That Coming Bee."

E. L. BRIGGS.

While reading Mr. Heddon's article in the last JOURNAL on "That Coming Bee," I was peculiarily struck with that beautiful, graceful smile which lighted up his countenance, or rather his "pen," at the method of Mr. Briggs, in the late prize effort in pro-curing the best stock of queens to breed from. After saying: "While orring the best stock of queens of breed from. After saying: "While I sympathize with the end in view, I must say that the method he employs to reach it causes me to smile with my pen, and is not at all the one I follow, advocate or believe in." He says, "I

will explain." As Mr. Heddon had been compelled. forced, urged by his pent-up forces and drawn out by his sense of the pub-

and drawn out by his sense of the public good, to utter the above important dissent to Mr. B.'s method, will be please to tell us what method "he does follow, advocate, and believe in?"

Well, here is the response: "First, let us consider the four points of excellence that Mr. B. makes the test: "The largest in size, herself, and producing the largest worker progeny."

ducing the largest worker progeny.'"
Mr. Heddon does not "follow, advocate or believe in" procuring the largest queens and workers at all, for he continues: "I have seen small queens that produced large, gentle and industrious workers, and such queens should not be reckoned as second-class." Therefore, the "first smile was penned." Mr. Heddon has smiled with his pen, therefore, if bee-keepers want the largest bees, such as can work on red clover, they should get one of the smallest queens whenever they buy a queen, for remember Mr. H.'s experience—remember his smile! He don't "believe in, advocate or follow" the method of breeding the largest queens for the largest workers.

workers. Second. Producing the brightest colored workers. Mr. II. pens his second smile and dissents as follows: "The experience of the most extension." sive importers and honey producers is, that the dark Italians are superior to the bright ones." Therefore, as the bright ones. Mr. II. does not follow, advocate or believe in producing light-colored bees, when you desire queens, order small dark ones; it will be so much more convenient for any one to fill your orders without any question arising afterward as to the purity of

arising afterward as to the purity of the queens you receive.

Third. "Producing a progeny the most peaceable in handling, and adhering to the combs the closest." After saying he does not follow, advocate or believe in my method at all, it seems a little singular to hear him say, "We agree exactly about the peaceableness, but I consider the adherence to the combs of minor consideration compared with other points of merit." Well, it makes me glad to find that Mr. II. and myself are in exact agreement on this third point of find that Mr. II. and myself are in exact agreement on this third point of excellence, for I, too, deem adherence to the combs of minor importance, as compared to some other points. For instance, industry, size, prolificness and gentleness. Yet it is very convenient and agreeable while handling a frame, not to have the bees rush to some gorner of the comb ball in there a frame, not to have the bees rush to some corner of the comb, ball up there, and tumble off in a mass upon your boots, or the ground, and from thence crawl up your ankles and legs, especially if they get next to the skin. My smiles are ant to all vanish on such occasions. Nor is it much more agreeable to have them take wing as the dark, brown and hybrids do, and dabinto your neck, eyes and ears every second or two. So, whether of major or minor importance, I choose to cultivate for instinctive and tenanacious adherence to the combs while handadherence to the combs while handling them.

Fourth. " As far as it can be ascertained this fall, the most prolific breeder, and honey gathering off-spring." Mr. Heddon again dissents to the first named quality, "prolific to the first named quality, "prolific to the first named quality," spring." Mr. Heddon again dissents to the first named quality, "prolific breeder," but agrees with the latter, "prolific honey gatherers." I always breeder," but agrees with the latter, "prolific honey gatherers." I always smile with gladness, when, at the beginning of honey harvest, I find my apiary consisting of colonies from which are pouring out and in tens of thousands of large, golden, industrious, gentle and vigorous honey gatherers, and nurses of the brood of a queen which keeps every vacant cell filled with eggs, larve or bees ready to issue. But here are his somewhat contradictory remarks: "I deem it a great mistake in bee-keepers to cherish and encourage this quality of prolificness." encourage this quality of proliticness \* \* I find that the most profit lies in

using a laye of that size that the very moderately prolific queen always keeps moderately profile queen always keeps full of brood. Small hives for surplus." But this is the hive question, Mr. Heddon, and not the queen-breeding qualities. But even then it is a good thing to have this "very moderately profile queen" keep her hive "full of brood," as admitted above.

To sum up, Mr. 11. follows, advocates and believes in—1. Small queens. He has seen some which produced

He has seen some which produced large workers. 2. Very dark queens. "These are superior to bright ones." Very restless bees and queens while being handled, is a matter of minor importance. 4. "Very moderately prolific queens," because they can only fill small hives. 5. He agrees that the honey gathering instinct and peacableness are qualities rather desirable, but he does not follow, advocate or believe in my method of procuring mothers of such instincts to breed from.

breed from.

It was precisely because Mr. Heddon and some others were not "following, advocating and believing" in the method of breeding only from the very best selected stock, from among the very best variety of bees, that I chose the method I did to get a half dozen of the very highest grade of queen bees from among the Italian race, to be found in America or elsewhere. I could have sent to Mr. II, or any one else, and procured haphazard queens, such as described, for a couple of dollars each, and when procouple of dollars each, and when pro-cured, they would not have been as good as those I had already, in one case in ten. But the result was, in five cases ont of the six, I received a superior queen—selected by her breeder with the special idea of out-

breeder with the special idea of out-ranking all her competitors.

So confident am I of its successful result, that I hereby offer a prize of \$20 for a queen sent me by any one-which will out-rank the ones I have received in the several points named, provided that if she falls below, the sender receives nothing for her, as a price, for I do not wish to be bothered with inferior stock in receiving and with inferior stock in receiving and inserting and caring for them when no better, or not even as good as my

In conclusion, I give Mr. Heddon In conclusion, I give Mr. frequency very best bow and smile, in return for his criticism, and hope he may pursue that method which will result in producing "that coming bee," which can work freely on red clover, be the gentlest to handle, and the greatest honey producer in the world. Wilton, Iowa, Nov. 17, 1881.

SELECTIONS FROM

Honey Cough Medicine. - The follow-Honey Cough Medicine.—The following is a recipe of a valuable remedy for obstinate coughs. It is especially valuable for long-standing coughs in elderly people, and useful in all cases unattended with a hot skin and very frequent pulse: Extracted honey; Linseed oil; Whisky, of each, 1 pint; mix. Dose,—one tablespoonful 3 or 4 times a day. Dr. G. L. Tinker. New Philadelphia, O., Dec. 6, 1881. New Philadelphia, O., Dec. 6, 1881.

t'omb Honey in Sections.—Will Prof. ook please give in the Weekly Bee Cook please give in the Weekly BEE JOURNAL the new method of obtaining section honey explained by him to the Michigan Central Convention, and given in report of same in the BEE JOURNAL on page 382.

J. C. THOM.

Streetsville, Can., Dec. 5, 1881

Every Number Worth a Dollar.—I send the money for the Weekly BEE JOURNAL for the next year. I would not lose any number for a dollar bill.
D. HIGBEE.

Avoca, Iowa, Dec. 9, 1881.

Labeled Pure. —I have tried to practice the teachings of the Journal. I love so much, and find it pays to warrant every pound of honey I sell to warrant every pound of honey 1 self to be pure honey. I did this last year, putting on labels, and I think from the way my old customers return, and new ones ordering honey, that it gave good satisfaction. I have not been able to supply one-half of our home-demand. John Meader. demand. JOHN MEADER.

Delaware, Iowa, Dec. 13, ISSL

[You are quite right; it does pay to warrant all your honey to be the genuine and pure article, and to label it so. It inspires confidence, and aids the general work of increasing the demand for and consumption of honey. -ED.]

Bees in Fair Condition.-Bees went into winter quarters here in fair condition. Last fall I had 21 colonies of black bees; had 5 left in spring; have 10 now, 5 of them Italians. Success to the BEE JOURNAL.
THOMAS J. WARD.

St. Mary's, Ind., Dec. 13, 1881.

Four Years' Experience.—In the spring of 1878 1 bought 3 colonies of bees—1 in box and 2 in movable frame hives: I increased them to 6, caught 1 wild swarm, and bought and sold some in the winter. I began the spring of 1879 with 10 frame and 3 box hives; the latter swarmed 7 times, and gave but little honey; the 13 averaged 63 lbs. per colony; from one 1 obtained 126 lbs., and from another 112 lbs. I 126 lbs., and from another 112 lbs. I think I increased to 22, and sold down to 16. In the spring of 1880 I sold I and exchanged queens for I, as I was interested in Italianizing all around me. This was the no-honey year, and I reared and sold queens enough to pay expenses. I winter in a cellar, and my loss has been I colony and I muchos, which stayed through my and my loss has been I colony and I nucleus, which starved through my neglect last winter. My bees showed some signs of dysentery, but came through in good shape; I took 17 out of the cellar, and before honey began to come in I had sold down to 10 extra good colonies. It was dry here early, and bees did not begin in earnest till what I have 10 whose it was lively in the start of about June 10, when it was lively; it made me smile to see the little fellows bring in the nectar. From my 10 colonies in the spring I obtained 1,610 onies in the spring I obtained 1,640 lbs., or 164 lbs. per colony, about 13 extracted, and the remainder comb without using separators, the most of which I can pack in crates. I used whole sheets of foundation. My best yields were from my best Italians; I colony giving me 237 lbs. of comb and extracted, another 146 lbs. of comb, and a third 68 sections 54 x64 g of comb, honey. The last colony I divided, and with its increase gave me 105 sections. honey. The last colony I divided, and with its increase gave me 105 sections. Others done quite as well; I had to extract from the brood chamber to give the queen room. I increased to 17 colonies and 3 nuclei, which I put in the cellar on the 11th inst. I have tried the Cyprians some, and can see nothing superior in them except prolificness. Unless I was working for bees instead of honey, I can see no advantage in them. A good portion of the time this summer, there was bees instead of floney, I can see no advantage in them. A good portion of the time this summer, there was brood in the 9 frames, and some that had on second stories laid in 2 or 3 frames there. I will try all the races, but shall breed most of my queens from my best Italian stock.

R. GAMMON.

R. GAMMON. Rockton, Ill., Nov. 22, 1881.

Feeding in Winter.—Please let me know through the BEE JOURNAL the best way to feed bees in the winter—

nest way to feed dees in the winter—whether candy made of A sngar or syrup? I have a colony I think I will have to feed. R. P. Williams. Goldsmith, Ind. [If in a good cellar, or if at the time of feeding the weather be so warm that the bees can put the feed where they can use it, then thick syrup will

be best; but if too cold, then use the candy, laying 14 inch square sticks on top of the frames, the candy on these, and carefully covering with blanket, mat or quilt. The exhalations from the bees will moisten the candy so they can consume it. Give them sufficient to last till moderate weather, as the candy will attract all the bees to the tops of the frames, and they cannot be again fed without much disturbance.—Ed.]

Good Honey trop.—1 lost all of my bees last winter except 5 colonies; they were rather weak. I lost the first swarm; then 1 divided, and with the addition of one new swarm increased to 12. They gathered in all 1,000 lbs. of honey. I packed them in leaves and cornstalks for the winter. E. C. CRANE.

Burlington, Iowa, Dec. 12, 1881.

Better than Bee-Books.—I have carefully filed every number of the BEE Journal for the past 2 years, and will have them bound. They are really have them bound. They are really better than bee-books, and I do not see how a bee-keeper can get along without the Weekly. Send it along for next year, and next, and next; yes, as long as I live and keep bees I shall want the American Bee Journal.

B. F. Carroll.

Discoulant Tax. Due 12 1881

B. F. CARROLL. Dresden, Tex., Dec. 12, 1881.

Alfalfa Clover.—Is alfalfa clover a honey plant, or do bees gather honey from it?

A. S. Edson.

Brooklyn, Mo., Dec. 12, 1881.

[Yes; it is said to be an excellent honey producer, but we have had no experience with it, and cannot speak from personal knowledge.—ED.]

Bee-Keeping in North Carolina.— There are about 300 colonies in frame hives in this county, but no intelligent management, as our people will not read. I commenced the spring with 36 colonies, increased to 50, and took 2,300 lbs. of honey, mostly extracted. I sell in Baltimore at 12 to 15 cents per I sell in Baltimore at 12 to 15 cents per pound for extracted, in tin cans, mostly in 3 and 6 pounds. I have purchased 15 colonies from a neighbor, and will buy more. I expect to commence the spring with 75 colonies. We have not as good honey resources as in some of the Northern and Western States, our season of surplus commencing about April 15 and ending June 1st; but in good seasons we get a fair yield but in good seasons we get a fair yield of honey, and then we are free from the fussing and fearful losses attending wintering as in the colder Northern climate. So, upon the whole, there is nothing to prevent the intelligent bee-keeper from making the business pay at least moderately well. Clinton, N. C. W. P. Wemyss.

The Nebraska State Bee-Keepers' Association will hold its annual meeting in Ashland, Neb., on the 12th and 13th of January, 1882. A cordial invitation is extended to all who are interested in bee-culture. Members will be returned to their homes by the

railroad companies at 1 cent per mile. T. L. VONDORN, Pres., Omalia. G. M. HAWLEY, Scc., Lincoln.

The eastern New York Bee-Keepers' Union Association, will hold their minth Convention, Tuesday, Jan. 10, at10 a,m., at Central Bridge, Scho. Co., N.Y. W.D.WRIGHT, Pres. N. D. WEST, Sec.

### Michigan State Convention.

The 16th annual meeting of the Michigan State Bee-Keepers' Society, was held at Battle Creek, Mich., on Dec 8, 9, 1881. Pres, Prof. A. J. Cook in the chair. The Secretary not hav-ing arrived, Mr. H. D. Cutting was appointed Secretary protem., who read the following on

#### How to Maintain the Pnrity of Italian Bees.

The superiority of the Italian bee over our native black or German bee is so well established, and so well known, that it would be superfluous for me to speak of any of their good qualities.

The introduction of the Cyprian and Syrian bees has also proven that the Italians are the best bee known to the American apiarist, and we doubt that American apparist, and we notice that they have any superiors in the world, or any equal to them. All we have to do is to maintain their purity and im-prove their good qualities to the highest standard of excellence

How shall we accomplish this

It is generally admitted that Italians are not a fixed race. This is well esare not a fixed race. This is well established by the irregular markings of the queens and drones, and I have no doubt there are different grades of purity among them, as I have had Italians breed uniform queens and workers, but very irregular in the markings of their drones. I have had other colonies of Italians that gave no uniformity in any of their progeny uniformity in any of their progeny, the workers having 3 to 5 yellow bands. These are the most prolific breeders and the greatest swarmers.

As to the breeding of Italians to the standard of purity—three or more yellow stripes, is quite easily managed where only blacks and Italians and their hybrids abound, as we can con-tinually supersede all queens that pro-duce workers with less than three yel-

low stripes.

In the parts of our country where the Cyprian and Syrian bees have been introduced, Italians cannot be bred pure with my degree of certainty, as those races of bees are said to be about the color of ordinary Italians, or per-

haps yellower.

If they are (as some assert) more yellow than the ordinary Italian, we could not condemn an Italian queen because she produced workers with more than three yellow bands, because Italians with 3 to 5 striped workers were plenty in this country before the introduction of yellow bees into this

country or Italy.

I would recommend that all parties having those new races of yellow bees, at once completely supersede them by the best strain of Italians which they had before they introduced those races, or by purchasing breeding queens from reliable breeders where they have not been introduced. To all others I would recommend the lat-

what are we to do about imported queens from Italy? I understand those new yellow bees are introduced there. If we import queens from Italy, we shall experience the same difficults it testing their purity that we ficulty in testing their purity that we have in breeding them together here.

I would urge our Italian friends to at once supersede those new races of bees, as I have just recommended our Americans to do, and I think, or hope, they will not have much demand for their queens in America. The introduction of those new races of bees has proven anything but a blessing to the apiarists of America. I am not disappointed; I expected no better

results.

Now if we expect to maintain purity in our noble Italians, we must procure our breeding queens from the best sources possible in this country or trate.

our Italians pure, but improve their

already superior qualities.
Palo, Mich. S. K. Marsn.

Prof. Cook thought that this judgment was too hasty, as the good quali ties of the Cyprians and Syrians should not be overlooked. He thought that Mr. Jones had done a great thing for the bee-keepers, in giving them an opportunity to compare the different

ees. Mr. Haikes had three yarieties, and preferred the Syrians, but was not yet ready to pronounce decidedly in their

favor.

Mr. Cobb offered a resolution that the Convention disapprove of the sentiment expressed in Mr. Marsh's paper. Carried.

Mr. D. A. Jones then addressed the Convention as follows, on

#### The New Races of Bees.

Years ago I became convinced that black bees were inferior to Italians ones nees were interior to italians, and as I was always determined to have the best, I purchased from many of the best and most noted American breeders and importers; I also imported, myself, and while the black bees appeared to be a pure race, the Italians appeared to differ greatly in many respects. I found that I could select and breed in almost any direction, especially dark and light; that there were great differences in color and quality; that there must be a mixture remember and the first that the selection. ture somewhere, and that the Italiaus were not a pure race; although superior to black bees, I found as much difference in their wintering qualities as I did in their honey gathering qualities, or strength of colonies. Hearing that the Cyprians were a superior ing that the cypirals were a superior race, and seeing no chance of securing them in their purity otherwise, I de-cided to shoulder the responsibility of importing them, and employed Mr. Frink Benton of your State (who is well and favorably known to many of race as wellable and outly sixtic hosyou as a reliable and enthusiastic beekeeper), then, going personally to Europe, Asia and Africa, enduring much hardship and at great expense, succeeded in landing safely in America, Carrion and Strains base in their ica, Cyprian and Syrian bees in their purity. The first season I did not test them sufficiently to decide their qualities thoroughly, yet I was much pleased with them.

Being absent from home so long in the East, and then having my islands to select and breeding establishments to arrange, and then 1 was too busy to give them as close attention as I would have liked to, but as I keep trained and thoroughly practical bee men and close observers. I was assisted much in noting their characteristics. We first observed their wonderful prolificness over Italians or blacks; in fact, the Syrian queens lay an incredible number of eggs in a day. I was more favorably impressed with the Syrian base, they the Cruday. I was more favorably impressed with the Syrian bees than the Cyprians, even in Palestine, as I found them there traveling such incredible distances for honey, although the Cyprians will travel much longer distances for honey than the Italians or blacks, besides, they fly much faster.

The Syrian bees will fly as far, empty themselves and return for another load in about, 13 minutes, as

another load in about 13 minutes, as Italians or blacks do in 17 minutes, and Cyprians are not much behind them in speed of flight; besides being swift in flight, they are less liable to be knocked about by storms and wind; they are more sensitive, or possess greater knowledge of atmospheric changes, and return to their hives be-fore the storms with wonderful rapidity and exactness

I was unable the first season, owing to my late arrival from the East, to test their honey gathering qualities fully, but found them breeding four times as much as others late in the season, and yet kept their hives stored with as much and more honey than others, thus showing their ability to gather sufficient for extensive brood-

that their wintering qualities outdoors might receive a severe test, arranging Cyprians, Italians, hybrids and blacks in a way that I might note facts. Now for the results: A black colony, by far the strongest, wintered worse; hybrids and Italians about equal; Cyprians wintered better than Italians, hybrids or blacks, and Syrians better than the Cyprians. Now, one swallow does not make a summer, nor one test form proof positive, in my opinion. Now for spring: I found them last spring building up stronger them last spring building up stronger and earlier than any others. One quart of Cyprians or Syrians, espe-cially the latter, will build up and be stronger when white clover blooms, than 3 pints or 2 quarts of black or Italian bees, in fact, they spread out and breed so fast that if a cold night occurs, the entrances should be closed to prevent the brood from chilling. Now this year has more firmly convinced me of their ability to gather large quantities of honey. If they can gather more honey, besides breeding doubly as much, does that not prove that if their honey was not used in brood rearing, they would nearly double their rivals in honey gathering? There is no trouble in coaxing them into the boxes for box honey. They into the boxes for box honey. They will gladly welcome any place where they can carry the honey out of the way of the brooding; they will work in boxes and sections when no others will; they build more queen cells care better for them than either Italians or blacks.

In one instance I recollect, a colony that I took from Mount Lebanon, car ried it to the coast in a water jug, and thence by steamer to Larnaca (my Cyprus apiary), and, to my astonishment, I found in the native hive when I went to transfer it, no less than 60 young queens all crawling about lively in the hive, and about 180 nice, large queen cells just ready to hatch, showqueen cells just ready to hatch, showing that they must have constructed nearly 250 large, fine and well-developed queen cells. They worked well on red clover this year, and would almost stand on their heads trying to press their proboscis down further to get the honey from the bottom of the clover tubes. They have no equals as energetic workers, and are both moth and robber proof. I have a very large number of Syrians and Cyprians, both imported and home bred wintering, imported and home bred wintering, and will carefully note results. They are more sensitive and require care in handling, for, if aroused, they show the same energy that they do in other respects—not to be beaten.

Lind one colour of Cyprisus that

I had one colony of Cyprians that was decidedly cross, and on two occasions after they were aroused by improper management, they forced me to walk away from the hive until they settled down. I had from 2 to 300 colonies in my home apiary in the very center of the town, and on the corner facing the two principal streets, with nearly all the stores facing my bee yard, and also a hotel—the bees within sand and also a note—the bees within 30 feet of both main streets, and mil-lions flying over the heads of people and horses passing, and I have not known one instance where any one

was stung. Thus far my preference is for the Syrian bees over all others; they are more prolific, wonderful breeders. more prolific, wonderful breeders, superior honey gatherers, and so far, have stood the winter best.

Mr. A. I. Root said that there is a great diversity of opinion concerning the new bees, but they are gaining in favor. They are exceedingly prolific, and very good honey gatherers.

Mr. Harrington's experience with the Syrians was similar to the last speaker's. He had found that queens fill a comb before leaving it. They would not attack if not disturbed; young queens are very active.

Mr. Jones. The Syrians are so rapid in their motions that they are difficult to introduce to colonies of other variour breeding queens from the best sources possible in this country or Italy.

By proper care in selecting our breeding stock, we may not only keep a hive, and two stronger ones in a way in the set of the set o

Shall Wo Continuo to Import Italian Queens?

I assume that the same laws underfie the breeding of bees as of other animals, and since our knowledge of facts relating to the breeding of bees is limited, I will draw conclusions, based in a measure upon the broader bases of the recognized laws of stock breeding.

The most easily understood of these laws is "like produces like." All through the realms of nature there through the realms of nature there seems to be a constant struggle between uniformity and variety. We never find two of anything exactly alike, although their general characteristics may be the same. At first sight it seems as if nature was at various with lowest but investigation. iance with herself, but investigation shows that her laws are working in snows that her laws are working in harmony, and if understood may be controlled. Their apparent discord is explained, the influences at work, the obstacles to be overcome, and the objects to be attained are understood.

To understand the elements which go to make up an animal, it is necesgo to make up an animal, it is necessary to know, not only its parents, but their ancestors also. The further back our information extends, the more satisfactory it is. The progenitors of an animal vary, and the animal may resemble any one of them. In case it does not resemble its immediate parent, but is like a remote ancestor it is called a sport. Here ancestor, it is called a sport. Here we see pature following the law of uniformity, and yet its effect is sometimes variation. This resemblance to a remote ancestor, or ativatism, as it is called, is one of the most important factors in scientific breeding. It can be readily seen that the larger the proportion of progenitors we have in a pedigree which have the traits we are pedigree which have the traits we are endeavoring to obtain, the greater will be our success. Pedigree is the main dependence of the breeder; it is variation which gives opportunity to make selection of breeding stock.

It is here that the skill of the breeder

is especially required, and it is upon this that his success largely depends. Whether selection had best be made by the breeder, or the mating of animals be left to their own choice, there seems to be a difference of opinion. By some, it is held that by the process, the poorer specimens will be culled out, and only the superior ones left to perpetuate the race. This theory almost recommends itself at first sight; but upon careful search, 1 can find nothing to support it; the burden of evidence is opposed to it. In every instance, as far as I can find, a carefully bred animal is superior to its prototype in the wild state. I think that the reason of this fact, if it is a fact, is that man selects more carefully than does nature, and with a definite aim; and his choice breeding stock is guarded from accidents. Also when an advance is made it is rethan does nature. When she has a hundred specimens, she rejects perhaps half of them. In a similar case, haps half of them. In a similar case, man would use but a single one. If the queens which are to stock our hives are to be carefully bred, and not taken at random, the question follows, who shall breed them? who shall breed them

It is generally held by breeders that the proof of long-continued, careful breeding, is to be found in a uniforbreeding, is to be found in a unifor-nity of offspring; also that a diversi-fied progeny indicates a diversified ancestory. If this test were applied to the queens which we receive from Italy, it would show them to have black blood, and to be the result of careless breeding. There are breed-ers among us whose queens are uni-formily good and well-marked. In every instance, as far as I can find, these men have kept the same strain of blood for a series of years, and made of blood for a series of years, and made of blood for a series of years, and made careful selection in each generation. There are apiarists with whom I am acquainted, who would not breed from a queen that was not better than most

of those imported.

It is sometimes said that we must continue to import only until the ma-jority of the drones throughout the country are of the desired race. Even if it were not true that we can rear

our drones as well as our queens, that time seems to be nearly, if not quite here. Italian blood is widely disseminated through the country, and many of the so-called wild bees are now in part, or wholly of this race. Says Mr. part, or wholly of this race. Says Mr A. I Root, in speaking of the charac ter of the bees which he is buying promiscuously through the country have frequently purchased colonies during the last few weeks as nicely marked as my in our apiary. These, oo, came from those who have never taken any notice of Italians at all. Gleanings for Aug., 1881, page 401.) I have quoted Mr. Root here, as his experience is so large, that his testimony is valuable.

It is thought by many that in-breeding is injurious, and that it is necessary to go frequently to the original source for fresh blood. As to just what in-breeding is, I can find no expect the source in the act definition; it is generally agreed that by it is meant the breeding to-gether of relations, but just how close the relationship must be to deserve the term, our practical breeders have not determined. Sometimes when de-generacy or disease follows close breeding, they are believed to have been caused by it, whereas they might have existed otherwise. In-breeding has been an indispensable aid in establishbeen an indispensable aid in establishing our best breeds of domestic animals. Their pedigrees show it to have been carried to a very great extent, yet they are the most valuable animals we have. Even if fresh blood were desirable, it seems doubtful if we could get it from Italy, as the stock which we have now was originally from that source.

I know of no better way to improve our beesthan that followed by the of larger stock. During the last 20 years that apiarists have been importing their bees, the other breeders have been diligently improving their animals by selection, importing comparatively but little. The improvement that they have made, we all know is very great. The stream has risen above its source, and shipments of very great. The stream has risen above its source, and shipments of breeding cattle from this country to their original homes are actually taking place. I think that it is not too much to say that America leads the world in live stock. Some Americans who have acted with care and intelligence, together with good judgment in breeding their bees, have obtained valuable strains, but I do not think that improvement has been general. The stock of those who have depended upon importation, has not been improved in this way, but necessarily represents that of the country from

which it came.
I can find no evidence that Italy has improved her stock during this time. I think if we had kept pace with the breeders of larger animals, that it is safe to say that we would be inestimably in advance of where we are now. If this view of the subject is right, importation is carried on not the cost of money, but also of all possibility of improvement.

Mr. A. I. Root thought that if bees were bred carefully that they would so valuable as to command almost

any price.

J. II. Townley thought that almost anything could be done with them by

### AFTERNOON SESSION.

On assembling, Mr. H. D. Cutting gave the following address on

#### Bees and Grapes.

I am well aware that much prejudice exists in the minds of some horticul-

turists in regard to bees doing damage

to their grapes and other fruits.

I have talked with many fruit men grapes and destroy large quantities of them." Others say: "77" them." Others say: "The bees swarmed on my fruit, but I found they were after damaged fruit, and not touch any fruit that was sound.

About five years ago I commenced a series of experiments to ascertain whether bees did damage grapes and other fruits. I found that the bees other trints. I found that the bees would work on grapes, if in a damaged condition. I found that the wasps and birds did the damage in many cases, and then the bees would finish up their work. Great changes in the weather at times of ripening, would cause grapes to crack open ever so littie, and the bees would clean them out. In the whole five years I failed In the whole five years I failed to find a single case where bees did actually bite open the skin of fruit and destroy it; but if there is the least opening in the skin from any cause, and the flow of honey is scarce, they will clean until diverse. they will clean out all damaged grapes but will not visit fruit of any kind if

but will not visit fruit of any kind if honey is plenty.

But I ask, is it not a benefit, in place of a damage? None of us want to pack fruit in a damaged condition, pack truit in a damaged condition, grapes especially; for, if on a cluster of grapes are only a few cracked ones, it will spoil the whole cluster and all others they come in contact with, if they are kept long.

I have seen thirty varieties of grapes; some very early and some very thin-skinned, and I cannot get my bees (and I have had 4 varietie to touch them. I have cut line clusters of very ripe fruit and placed on the platforms of the hives, and the bees would go over and around them. I then cut small openings in a few berries, and in a few moments they were covered with bees, cleaning them out. After finishing all those cut, they went all over the sound ones, but did not cut one of them. I made pin holes in a few of them with the same results; all so treated were cleaned out. I had some very thin-skined grapes sent me for trial, but with the same results as before—none were touched unless first punctured.

I suspended a cluster of grapes under a free and poured sugar syrup on it; they took all of the syrup, but did not damage the cluster, until a wasp managed to bite three berries before I could kill it; those three the bees finished.

In conclusion, I must say that with the many different experiments covering a space of 5 years, being surrounded by bees and affording them every opportunity of doing damage, and failing to find them doing any. I think those who condemn the bees had betthose who condemn the bees had better experiment for themselves and ascertain whether the bees do them any damage or not; they may come to the same conclusion, as the good people of Massachusetts, who years ago thought the bees were a damage to their fruit, and had them banished, but finding their fruit began to decrease, and of a poor quality, were only too glad to have the law repealed, and get the bees back again, when and get the bees back again, when their fruit began to improve.

The field is broad; let all those who have their doubts carefully experiment for themselves. Do not jump at conclusions, and what is done, let the work be careful and thorough,

Dr. Southard grows a great many thin-skinned grapes, and had never known sound fruit to be injured, and damaged fruit he does not value.

Mr. Jones said he would give \$15 if any one will show him a queen whose bees will puncture grape skins. Mr. Balch said that no one can tell

to whom trespassing bees belong, and if bees were banished from the State, the loss to horticulturists would be greater than the damage done by them.

Dr. Ashley recommended for bee-stings a solution of iodide or bromide

of calcium.

Dr. Southwick then addressed the

#### A Few Mistakes of a Few Bee-Keepers.

It is a mistake to hold all rules in bee-keeping invariably correct; for rules in bee-keeping, like rules in spelling, have more exceptions than

ases under the rule.

It is a mistake to take any man's opinion without experimental knowledge and his reasons for the same; for one good reason founded on experience is worth more than all the

ppinions in the universe.

It is a mistake to follow the ways, or adopt the hive of a successful bee or adopt the five of a succession of the same; for good locality, or some unknown cause, may produce the success in spite of his bad management and bad hive.

It is a mistake that bee-keepers ought not to take the benefit of the patent laws, as well as others, and thereby be enabled to get a royalty sufficient to pay them for their time and expense of getting up the improvement of the partition of th provement; if we could get up special donations, through special Providence, we might then dispense with the ben-efit of patent laws, but we are not all thus favored.

Concerning dysentery or the cause,

one may say it is confinement, another bacteria or bee-bread, while I am satisfied, and by the postals I have re-ceived, I think some others are, too, that starvation will sometimes pro-duce it. But it is a mistake to say that any one thing is the sole cause for it is evident there are many causes. and frequently a variety of causes, for it is quite probable that with the bee, as with the human, anything that will change the action of the system so that instead of taking from the alimentary canal and furnishing the system nourishment, it takes from the system and throws into the canal, will produce dysentery.

Concerning frames and hives, Mr. Concerning frames and hives, Mr. A. I. Root would not use any but the Langstroth frame and hives to fit, while I would not use a frame that I had to hang in the hive, or a hive that I could not move the end-board together or apart, or take them out at pleasure, and thus increase or lessen the size as I saw fit; but it is a mistake for either of us to claim that ours is for either of us to claim that ours is the *ne plus ultra* of all hives, for there may be many as good, and some far superior to ours, It is a mistake to follow instinct in-

stead of reason; instinct is the same old way—reason invents, compares and selects the best; instinct was as perfect a thousand years ago as to-day—reason will continue to improve. but will never perfect; instinct indicates straw and box hives, also fire and brimstone—reason indicates comfortable hives and handy frames, also

justice and mercy.
It is a mistake that because a colony winters well in a hive that has a crack wide open from top to bottom, that all hives need that ventilation; for a strong young colony will winter, not-withstanding this unreasonable ex-

It is a mistake to have a two-inch space above the frames for the heat and bees to get up into, when the heat and bees are required among the combs to keep them warm, so that the bees can get over them and feed when the weather is cold, and not freeze in the operation.

It is a mistake to get up a hobby of any kind, and then drive everything else off the track that it cannot load

It is a mistake to accept all the theories of bee logic as infallible, such as fertilization of queens, and the like; fertilization of queens, and the like; for I had a queen when hatched lacked about half of one wing, yet in due time she became fertilized and filled the hive with bees.

It is a mistake to write long, windy articles for our bee-papers, that are noted only for their big words, line

make new ones, to hear the different addresses and essays, make comments on them, ask and answer a few questions, and have a good time, when in addition we should have the expe-rience of all the members on the different subjects of bee-keeping written out in a short, comprehensive style, without comment, and these, with the essays and lectures, and full proceedings of the Convention, printed in pamphlet form and distributed to the members, or sold to outsiders for enough to cover the cost of printing, then we would have a record that would be valuable to refer to afterwards.

It is a mistake to offer, and a much greater mistake to accept, a reward for breaking off the filthy use of to-bacco; for a man that will not get up out of that miserable, soul-debasing, health-destroying, clothes-besmearing, breath-poluting, sense-benumbing, brain-befuddling, nerve-poison-beliable without a reward, but will ing habit without a reward, but will for ever sink himself too low for any human society, and the whole looks to me like the proceedings of a protrac-ted meeting I once heard of, where they offered a ten cent chromo to all that would come forward and get religion.

The Srecretay read the following from Mr. W. Z. Hutchinson, on

#### Rearing and Selling Queens.

Some apiarists have asserted that Some apiarists have asserted that the so-called "dollar queens" could not be reared at a profit. I have been engaged in the business during the past four years, and have never cleared less than \$15 per colony, the average profit for the four years being about \$18 per colony. As I have been so successful, perhaps the members of the conventions would like to know the conventions would like to know how I have conducted the business. I have learned that nothing is

gained by commencing operations too early in the season. Colonies are weakened, brood is chilled, queens are two or three weeks old before they begin to lay, in fact, there are nothing but unpleasant features connected with commencing before the warm weather have really govern to star. weather has really come to stay.

f think a small frame best for queen rearing. If it were not that I might sometime wish to give up the queen business, and go to raising extracted honey, I should adopt a frame not honey, I should adopt a frame not more than 10 inches square. I use the

American frame.

For nucleus hives, 1 use full-sized hives, putting in division boards, and having a nucleus in each end of a hive. having a nucleus in each end of a hive. Usually about the 10th or 15th of May, I put a nice, clean, light-colored worker-comb in the center of the colony, having the queen from which I wish to breed. In 3 or 4 days I generally find this comb filled with eggs, and the first-laid eggs beginning to hatch into larvae. I now remove the queen and all of the brood from some strong colony, shaking the bees from the colony, shaking the bees from the brood combs back into the hive, and giving the brood to the weakest cologiving the brood to the weakest colo-nies. The queen is either sold, or given to a nucleus prepared expressly for that purpose. The comb of eggs and larvæ from the choice queen is now placed in the center of the queen-less and "broodless" colony. I usually cut a few small holes in the comb, just where the eggs are beginning to hatch, as it gives the bees better opportuni-ties for building queen cells. After removing the comb of eggs from the colony having the choice queen, its place is filled with another nice comb, or else a sheet of foundation. In 3 or 4 days this comb will be filled with eggs, and can be removed and given to another queenless colony, and its place again filled with a sheet of founplace again filled with a sheet of foundation. By the time that the sheet of foundation, last inserted, is drawn out and filled with eggs, the first lot of queen cells will be ready for the lamp nursery. I seldom allow a colony to build more than two lots of cells without giving it young bees. Two or three days before I expect the first lot of queens to hatch, I start as many nuclei as there are cells. Early noted only for their big words, line turned sentences, and extreme length, and if they contain an idea, it is lost in a wilderness of words, and the reader takes the length of the article for the weight of argument, and concludes the writer has made a point.

It is a mistake that we meet here in convention only to see old friends and in the season I seldom start more than

one nucleus from each colony, and 1 do this by taking three combs with the adhering bees, and putting them in a nucleus hive. At least one comb should contain brood. As the weather becomes warmer, the strongest of these three-frame nuclei are divided.

I consider it important to always have on hand a large stock of queen cells, even if I occasionally have to destroy young queens. A breeder cannot rear "dollar" queens at a profit, if he allows some of his nuclei to stand queenless several days for lack of queen cells. When honey is coming in plentifully, I prefer to put a young queen upon the combs of a nucleus at the same time that I remove the laying queen, but when there is a scarcity

ing queen, but when there is a scarcity of honey, this plan does not seem to work so well, as many of the young queens are killed by the bees.

One other point I also consider important, and that is that no nucleus should remain a single day without unsealed brood. Attention to this saves a world of trouble, and largely increases the world's

saves a world of trottole, and largely increases the profits.

But rearing queens is one thing, and selling them is another. A man may rear the best of queens, but unless he can sell them, his labor is lost.

Recognition that it is any by the Remember that it is only by the strictest attention to business, that the rearing and selling of queens, at the present prices, can be made profitable, and, in my opinion, the selling is of as much importance as the rearing.

breeder of untested queens The breeder of untested queens ought always to have orders on hand, so that queens can be shipped the very day that they are ready, as, after a queen has filled the combs of a nucleus with eggs, she is kept only at a loss. "But," says one, "how can this state of affairs be brought about? we cannot comed nearly the control comed nearly the control comed nearly the control comed nearly the control comed nearly the control contro cannot compel people to send in orders whenever we need them." Very true; whenever we need them." Very true; but did you never notice seems to be a peculiar something about something seems to be a peculiar something about some breeders, and the manner in which they advertise, that captivates the public heart at once? The orders come pouring in, and the trouble is not in finding customers, but in rearing queens fast enough to supply the demand. But, you say, all of us have not such a "taking way," or business test. Cartainly, not and or business tact. Certainly not; and for this reason, I would advise all those who think of entering the ranks as queen breeders, to not go into the business very heavily at first. It is better to spend \$40 or \$50 in discovering that rearing and selling queens is not your fort, than it is to spend five times that amount in acquiring the same knowledge. It is better to have more orders than queens, because the money can be more easily returned than purchasers can be found for surplus queens. And, by this way, if you wish for plenty of orders, then when a customer says, "Send my queen by return mail, or else return the money," do just exactly as he says; do not wait a week or two, thinking that you may be able to "squeeze out" a queen for him in a few days, and that it will be all right in the end. Were I that cusall right in the end. Were I that customer, it would be the last queen that you could sell me. Don't advertise mitll you have some queens on hand. Let your advertisement be plain and straightforward. If you must exaggerate, do it in filling orders. That is, do a little more for your customers than you have agreed to do. If you cannot fill an order at once, tell your customer at once why you cannot, and when you think you can fill it. If he does not wish to wait so long, he can order the money returned. Answer every in-quiry promptly, kindly and plainly. After doing your very best, there may arise some trouble or misunderstand At such times, try and look at the matter from your customer's standpoint, as well as from your own, and practice the golden rule.

W. Z. HUTCHINSON.

Rogersville, Mich.

Mr. B. Walker had been successful in using a nursery for cells made in the top of a chaff hive, and kept warm

Mr. Heddon then addressed the Conyention on "Comb Foundation,"

on page 395.

Mr. Root believed that the Given

press will supersede other machines. Mr. Heddon uses strong lyc for a Inbricator.

#### EVENING SESSION.

The evening session was opened by Prof. Cook, with his address on Crumbs Swept up from the National

'onvention." Mr Jones believed that in many cases one-third of the crop of honey was lost by being eaten by drones.

Dr. Kellogg addressed the meeting

on "  ${f A}$  dulferation of Food and Honey Honey is the first sweet known, and is composed partly of natural grape sugar, contains some pollen, and is stored by the bees with but little, if any alteration. The value of sugar as an article of food is very great; it assists in the production of heat and fat. but does not enter into the solids of the body. When starch is taken into the body, it is largely converted into sugar. Sugar is very digestible. The odoriferous qualities of honey are an important element in it; they are generally valuable, though sometimes ininrious; such cases are generally due to an idiosyncrasy in the person. Cane sugar is the purest form of sugar. Honey is very valuable in some cases of sickness. If honey is adulterated with glucose, the fraud may be detected by the use of a warm solution of barium, which, if mixed with it, will cause a milky appearance. The honey should be thinned with water, which should be perfectly pure; if there is lime in it, the effect will be the same, although the honey may be pure. The speaker said that it had never been demonstrated that cheese contained demonstrated that glucose contained any nourishment, and he believed that the opposite was the case. He thought its value for food should be determined by practical tests, rather than chemi-cal analysis. Glucose is made by the or woody fibre, and the acid is, of course, injurious, if not all extracted. He cited an instance where it had eaten the cork in a jug of golden drip syrup. Such action on the stomach is dangerous.

It was essentially innutritious and unwholesome. All the symps now offered in the stores are adulterated with liquid glucose, and all the sugars except confectioners'  $\Lambda$ , with dry.

Mr. T. G. Newman then asked Dr. Kellogg to explain the difference be-tween the articles known to commerce as glucose and grape sugar. He replied that there was no difference, except that the liquid was called glucose and the solid was named grape sugar, to distinguish them commercially. Both were manufactured from the same material and alike, with the single exception of the addition of other chemicals to solidify that de-

signated as grape sugar.
Dr. Ashley had noticed many cases of sickness and stomach disturbances produced from this cause. Confectioners' A sugar is always pure, and any other that has coarse crystals. It had been found that bees will starve on glucose.

A. I. Root thanked the Doctor for his able and instructive address. It had more than paid him for his trip

from Ohio.

Dr. Southwick said he had visited the glucose factory in Buffalo, N. Y., and was told that they used from 8,000 to 10,000 bushels of corn per day, and were enlarging their works.  $\Lambda$  commercial traveler called on them to solicit advertising. They said "they did not advertise."

Heddon: The first I heard of worse

Mr. Heddon: The first I heard of glucose I thought it, perhaps, worse than others—so white, and as clear as water, very thick, and a dangerous article, as it could be so readily used in adultantian.

in adulteration.

Prof. Cook: I am glad to hear the remarks of Dr. Kellogg. I teach, in the college, that the grape sugar of commerce and the grape sugar of honey

other glucose.

Nr. Newman: 1 admit that the phrase "Chicago honey" is a by-word. The jars are all adulterated, yet pure honey is sold there by hundreds of tons. Respecting adulteration, I have ever opposed it, and shall always contime so to do. Honey is but in its infancy. The demand will soon be such that all the bee-keepers of America cannot supply it. The fact is America has the flowers which make the best grades. In regard to the use of that trash, called glucose, for any purpose in the apiary, I would say, now and forever, "Taste not,

say, now and forever, "Taste not, touch not, handle not."

A. C. Balch. The odor of honey may be kept indefinitely, by putting it in cans and hermetically scaling it.

Mr. Heddon. Bee-keepers do not adulterate honey; it costs too much. It is a nice trick to adulterate it; the objective is a trade by itself. We donet mixing is a trade by itself. We do not want jars for honey; they cost too much. Honey will sell in cheap paper or other packages.

To liquefy honey set

Dr. Whiting. To liquefy honey set the jars on a board in the stove-oven, and let them heat slowly. The jars remain clean and the labels bright.

Prof. Cook hoped all our people would act and speak against adultera-tion all the time. Mr. Newman, of Chicago, and Mr. Muth, of Cincinnati, had done much to build up a fine sta-

le trade in extracted honey. Mr. Haikes. Let us form ourselves nto a committee of the whole, and

into a committee of the sell only pure honey.

Dr. Ashley. Medical men are finding new diseases of the stomach which around explain. They are found the story cheap especially among people using cheap

Prof. Cook offered the following:

Resolved, That we urge the editors and publishers of our bee papers to speak and act against the use of gluose or grape sugar, and the adulteration of honey. Adopted manimously.

Mr. Newman made a few pleasant remarks, which were well received; he said Solomon's advice was right when he said: "My son, eat thou honey, for it is good.

A resolution of thanks to Dr. Kellogg for his address was adopted, with a requust that he furnish a copy for publication. Adjourned.

### FRIDAY MORNING SESSION.

The session opened with a discussion about bee-publications. The fact ion about bee-publications. was brought out that they are sidered necessary, and many of those present were willing to pay any price necessary for them. One gentleman had saved \$20 by watching the market

menorits.

Mr. T. G. Newman gave an address on "The Future of the Honey Market." He said he had given the sub-He said he had given the subject a great deal of thought, and be-lieved the market, to be developed, should be kept constantly supplied. He thought that extracted honey is to become the staple for the masses, and that comb honey, being higher priced, would be used more by the rich, al-though it was but little, if any better. The market may be extended almost indefinitely, if properly managed. A few years ago the bee-keepers of California were producing more than could be sold at home, and the price became very low. By sending samples over the country, the demand be-came so great as to leave no honey for the use of the producers themselves. California honey is now in demand everywhere. A proper working-up of the market had accomplished this. He expected to see the time when honey would be sold at the door of apiaries, instead of going through the hands of dealers. He strongly advised every honey producer to develop his home market, and cited instances where great good had been done it. Our foreign market for honey is developing fast, and was destined to be very large. Wherever honey is introare not the same. Our friend Mr. duced, itselfs afterwardson its merits.

Honey must be put in marketable shame) has talked with the factories, shape, and this is rapidly growing to

printed in last week's Bee Journal, and they call one grape sugar and the be the case. He thought that a bright

future was very near.

When honey can be sold at the door of every apiary, it is a staple. Men will look the country over, buy the honey, and all will be sold and distributed. Honey is good to keep. It is not perishable. It can be transported to foreign markets.

Mr. Jones, Ontario, found that in Mr. Jones, Omario, found that in Canada small packages sold best; sells best in tin cans; exhibited five sizes of cans, holding from 2 ounces to 5 lbs. The five cent packages sold the best at the fair at Toronto. to 5 lbs. The five cent packages sold the best at the fair at Toronto. The small cans brought in larger orders. He sold 15,000 lbs. at home and 30,000 at the fair. He said small and 30,000 at the fair. He said small packages were best; he used tin cans. Small packages prepare the way for large ones.

An essay was then read on

#### Something about Foul Brood.

Stock-breeders or fauciers of any kind desiring to meet with success must keep their eyes open at all times. One may be favored or injured by lneky or imfortunate circumstances, but success in every business is generally the result of intelligent management and prompt attention. the same degree the reverse is caused by ignorance or inattention.

Nothing requires more the attention of bee-keepers than to guard against the spread of foul brood. Small is the trouble to cure a colony or two, if discovered in time, but the whole apiary covered in time, but the whole apiary is in danger, just as sure as a single colony is overlooked. If infested in the spring, every colony will, very likely, be diseased by the approach of winter, and no neighboring apiaries will be seef. will be safe. In essays, on former oc-casions, I have spoken of the dangerons and insidious character of foul brood, and gave also simple and complete remedies. Interested parties will find records of the same in our bee papers of the present and past years, and save me unnecessary repetition. My object now is to admonish our friends to be watchful for their own sake and for our common welfare and to show how easy, with a little care, great trouble and loss may be prevented prevented.

You will remember my statement at the National Convention, at Lexington, Ky., of my having a few hives infested with the disease during last summer, and of their cure. Lexpected to have had foul brood rooted out once more in my apiary, and, no doubt, I was correct at the time; but perhaps an invisible little speck, a fungus, was hidden in the fissures of the table on which an infected hive had stood, or hidden somewhere on my bee-roof. on moden somewhere of my bee-root, until it was carried into the hive on the feet of a bee, and brought into contact with a larva. The colony had a number of combs with brood, only a number of comos with brood, only two of which contained a few cells with diseased larvae. I exhibited the worst comb at our National Conven-tion at Lexington, last fall, and very few of those present would have recog nized as diseased a comb like it, if found in one of their hives. It was, nevertheless, the most dangerous kind of foul brood. On my return home I put the bees into a clean hive, on foundation, and fed them with honey and salicylic acid as described at the and safetyne acid as described at the meeting. They had commenced nicely to build out their foundation, but it being late in the season, I exchanged them for combs well filled with capped honey about a week afterward

On preparing my bees for winter, I discovered, in two more hives, one or two cells each containing larva distwo tens each containing layer used with foul brood. The combs of these three colonies, and all the combs that were in their hives during sunthat were in their hives during summer, will be rendered into wax, and my first care in early spring, when bees commence to breed, will be to place a jar of honey above them prepared with salicylic acid. Those few diseased cells would have done no harm this winter, but the trouble they would have given me by next summer can only be estimated by a person acausinted with the disease. quainted with the disease

Larvæ dead from any cause will de-

cay in the cells if not removed, diffuse the same stench, and will have about a uniform color and appearance, differing only according to their age; but if dead of foul brood, the skin decays about the same time with the body, about the same time with the body, which causes the ropishness of substance, and the inability of the bees to remove if from the cells. Larvae dead from other causes may have deeayed to a soft watery mass, but when eayer to a soft watery mass, but when a pin or some similar instrument is used, one can remove it easily, as the skin acts like a sack to the soft body. I maintain the idea that toul brood

is an imported disease, and spreads by infection, and not by chilling of brood or other surrounding circumstances indigenous to this country. I fear that this dread disease, now among us, cannot be rooted out any more. It may show itself at one piace or an-other before we are aware of it; but by due vigilance it can be kept from spreading, and none of us can be too careful about it. Chas, F. MUTH.

Cincinnati, O.

Mr. Jones had thoroughly tested salieylic acid and had found that it had no effect; he believed that nothing would kill it but heat. He thought it could be as easily managed as the bee moth. A discussion followed.

President Cook said that in many cases we must understand pure science m order to understand applied science, and thought that scientific investiga-

and thought that a training the disease.

Mr. Townley. I have lost 60 to 76 colonies, and think a bonfire the quickest and cheapest cure. Total cre-

mation.

Mr. Jones. No use in cremating.

Dr. Whiting. Have had foul brood,
and caution bec-keepers not to take it
to their hives; it will not do to handle
it carelessly. Put the bees in a box 48 hours, then put them in another cleanhours, then put them in another clean bive with comb foundation. I kept one hive, cleaning out combs, and hatching the bees that could hatch, and the bees made a large amount of surplus floney. I succeeded in curing

my apiary.

Mr. Hubbard. Honey does not show foul brood, but needs to be boiled if

fed to bees.

Dr. L. C. Whiting then addressed the Convention on

### The Coming Bee Hive.

We hear a good deal about the coming bee, and but little of the coming hive, in which we can best secure the product of bee industry.

product of bee munstry.

Permit me to call your attention to a reversible frame hive, which is being used by some of the best beekeepers in the country. This hive has all the advantages of the Langstroth and Quinby hives combined, at the integral of the product of the country. the increased expense of only one cent a frame over the Langstroth. I will

a traine over the Langstrotti. I will state as briefly as I can some of the advantages of this hive.

The frames stand on a shoulder at the hottom of the hive, and when properly made, the metal corners are the only places where the frames touch made of the root the hive. If you wish each other on the hive. If you wish to fasten the frames for safety in shipping, all you have to do is to slip in a couple of wedges and crowd the frames close together and all is firm and se-cure. As they touch only at the corners, there is no danger of the frames

coming together and destroying the

Whenever the bees store too much honey in the upper part of the comb, the frame should be turned over, placing the honey at the bottom, and the brood at the top. If you have selected the right time to reverse the nected the right time to reverse the frame, the bees will remove the honey to the boxes, and fill its place with brood. You have thus gained two important points—your honey in the boxes, and an additional amount of brood.

Some of the handsomest frames of brood that I have ever seen were obtained in this way. The important tained in this way. The important time to reverse the frame is just be-fore the close of a good yield of honey. If deferred too long, the bees some-times refuse to carry the honey to the

are toughened and strengthened are toughened and strengthened by having brood reared in them, thus making a very desirable frame for ex-tracting from. Those who use this hive, claim that they get from 10 to 15 pounds more honey in the boxes than s obtained by the usual method, and a large increase in brood.

There are other advantages claimed Figure are other advantages canned for this hive, but they do not appear to be so well founded as those mentioned. Mr. Van Deusen, of Sprout Brook, N. Y., is the originator of this frame, and I hope will give us more light to the above the present the state of the present the state of the present the state of the present the state of the present the state of the present the state of the present the state of the present the state of the present the state of the present the state of the present the state of the state of the present the state of the present the state of the ight on the subject through the BEE JOURNAL.

Mr. Harrington said that after 9 rs' experience with alsike clover, had found he could grow it on heavy land if it was well worked, and it is a very valuable bee-plant. It is a plant for both farmers and beekeepers.

#### AFTERNOON SESSION.

The session was opened with the following resolution, which was adop-

ted unanimously:

\*Resolved, That the executive committee be requested to procure 200 copies of the proceedings printed, and that a copy be sent to each member.

The following cities were voted upon for place of meeting next year: Grand Rapids, 20: Detroit, 21; Kalamazoo, 23. The latter place was chosen.

The following officers were elected to the following year: President, The following officers were elected for the following year: President, James Heddon; Vice Presidents, Prof. A. J. Cook and Dr. Southard; Secretary, T. F. Bingham; Treasurer, T. M. Cobh. The following gentlemen were appointed a committee to attend to the interests of apiarists at the next State Fair; H. D. Cutting, Prof. A. J. Cook, Dr. O. H. Ranney, A. R. Weed, James Heddon and Byron Prof. A. J. Cook, Dr. O. H. Ranney, A. B. Weed, James Heddon and Byron Walker. H was voted to request Messrs, Jones and Newman to attend the next meeting.

The following essay was read on

### Extracted Honey.

I think that the best essay I can write, on the above subject, is to detail what we have done and what results we have obtained. Accustomed as we we have obtained. Accustomed as we had been, in France, to see candied honey sold as a staple article, we could understand why it could not be readily sold in this country, since it is a purer article than comb honey, not being any more mixed with beeswax. and since it can be sold cheaper, and shipped without any trouble. As soon as we heard of the discovery of Maj. Hruschka, the inventor of the honey extractor, we hastened to have a machine made and to use it.

But we soon found that, while to extract honey was easy, to sell it was the most difficult part of the job, the granulating of our honey hindering our sales. Several lots in glass jars were returned to us on account of its having become similar in appearance to lard

poor quality. These difficulties did not deter us from our undertaking, which was rendered more difficult yet by articles published in the bee papers, in which the granulating of honey was consid-ered as a defect, which the bee-keeper had to correct by boiling it. also to contend with the adulterators, who were quick in saying that the candying of our honey proved that it was made from sugar.

then wrote, in the bee papers. that the granulating of honey was the best test of its parity. This state best test of its parity. This state-ment, at first, met several denials, but ment, at first, fine several demans, our as truth sooner or later prevails, our assertion was soon after indorsed by several societies of bee-keepers, and is now admitted as a positive fact.

as now admitted as a positive fact.

After becoming disgusted with glass jars, in which candied honey does not look to the best advantage, we tried wooden pails; but their capacity was too large for retail. Then we used tin wooden pails; but then eaparry was too large for retail. Then we used tin pails, like those in which the workmen carry their dinner. These pails, weigh-ing 10 lbs. gross, were found too large

hoxes. When the combs are turned vet, so we divided them in pails holdover, the bees make them equally sering 5 lbs.,  $2^1$ , lbs., and  $1^1$ 4 lbs. gross, cure at top and bottom, and all parts. These pails are now manufactured in ling 5 lbs., 2½ lbs., and 1½ lbs. gross. These pails are now manufactured in several States of the Union, where we sent samples for patterns. We were also led to have them manufactured for sale, and the increasing demand for them shows that the sale of exd honey is now comparatively Let me here advise you to adopt easy. Let me here advise you to adopt mifform sizes for these pails, as did Mr. A. H. Newman, who sells the same sizes that we do, even if you have a few cents more to pay per hundred to get the uniformity, for the uniform packing of an article tends to make a staple of it. The manufacturers of other articles sold in the groceries are careful not to vary the size; we had better imitate them in this respect.

As a result of our efforts, we now begin to foresee how large will be the use of extracted honey in this country. Our extracted honey is every year coming more and more into demand, We have ascertained that a city of 12,000 inhabitants, in which it was at first difficult to sell 500 lbs, of extracted honey, can consume now 5,000 lbs., yet as it is less than a pound yearly for every inhabitant, we can look for greater sales in the future. But to obtain such increase in the demand, we have to observe some property. we have to observe some precautions. which may be thus enumerated:

Do not put on the market unripe dirty honey; have it well skimmed

and strained.

Put it in clean tin pails, provided with neat labels, indicating your address and the weight, and warranting its purity, proclaiming also that gran-ulation is the best test of its purity.

3. If you cannot sell your pails, put

some of them in the best groceries of your neighboring towns, to be sold on commission, and to be returned if not sold or not found as represented

sold or not found as represented.

4. Do not ask fancy prices. All our crop of this year, a little above 14,000 lbs., will not about 12 cents a pound, and we find that this price pays well.

If most bec-keepers would adopt our method, we predict that the honey crop of this country would be easily sold at home, even if it was ten times greater than it is now.

Hamilton, Ill.—Cuas, Dadant.

Hamilton, Ill. Chas. Dadant.

Several members deprecated the use of the word "strained" as applied to honey, when "extracted" was meant. It was declared by many that when honey was stored in large quantities, the best of it was found to be at the bottom of the cask. Any particles of wax that there may be in the liquid honey may be caught by skimming or passing the honey through a piece of cheese-cloth.

Mr. Heddon has found that honey will ripen after being taken from the hive; he stores it in crocks. He said it is a great deal of trouble to the bec-He said keeper to liquefy honey on a large scale after it is candied, and advocated making a market for candied honey.

Mr. Balch said that honey would

keep perfectly if kept in air-tight jars. He recommended honey and honeycandy for children, in preference to that for sale in the stores.

President Cook said honey may be extracted when green, if it is kept in warm, dry place, where it will ripen. Mr. Muth's opinion was the same.

Mr. Bingham showed a comb containing capped honey, most of which had evaporated by reason of the warmth of the hive.

Dr. Ranney had found that extracted honey would lose nothing if well ripened, and that thick honey would absorb moisture. Some kinds of honey will candy much more quickly than others. This honey will candy before others. others. This noney will calldy before that which is thick. Mr. Bingham insisted that honey

should be well ripened before being put upon the market. He thought that green honey would injure the market.

Mr. A. I Roof addressed the Convention on "Selling Bees by the Pound." He said that it was a comvention on "Sening bees by the Pound." He said that it was a comparatively new industry, and they are session. Wednesday and Thursday, shipped even long distances. A person could commence the business of the State Board of Agriculture. By keeping bees on a very small scale.

He had known a half bound of bees and a good queen to make a good colony by fall, and yielded some honey; they were provided with combs. When whole colonies are sent by express, the frames should be wired, and the expense of carriage was burden-some. He can ship bees cheaper and more safely in a small wire cage than when in the hive. They were provided with water for drink and sugar The best way to introduce queens was to buy a few bees with her and turn them, all loose on a few frames of them all loose on a few traines of hatching bees and honey. He had seen two pounds of bees and two queens in the spring make 4 good col-onies by fall. They had had good care. The manner of putting the bees in the traveling cage, is to put the cage on scales and insert the smallend of a large tin funnel; the bees are then shaken into the large end. The queen is put in last. Mr. Jones considered bees worth as much as \$4 a pound before the harvest, and 50 cents after.

[Concluded next week.]

#### Local Convention Directory.

Time and Place of Meeting.

Jan. 10—Corthand Union, at Corthand, N. Y.

127 In order to have this table complete, Secre taries are requested to forward full particulars of time and place of future meetings.—ED.

To the Bee-Keepers of Indiana. the last meeting of the State Bee-Keepers' Association, the Society was changed to a delegate organization, and one Vice President was appointed for each county of the State, whose duty should be to organize the various counties into auxiliary County Asso-ciations. I would, therefore, request all persons interested in scientific bee-culture, to unite in their respective counties and organize themselves into rouniles and organize themselves indeal auxiliary County Associations, subject to the State Association. Each mem-ber of the County Association by paying to the Secretary of his County Association 50 cents, becomes a member of the State Association, and is en-titled to the printed transactions of the proceedings of the State Association, thereby getting a full return for all money invested. Each County Association will be entitled to one Association will be entitled to one delegate for every five members, and one for every additional fraction of more than half of this number. Copies of the constitution and by-laws of the of the constitution and by-laws of the State Association, together with any other information in connection with the organization can be had on application to the Secretary, Frank L. Dougherty, at Indianapolis, The Association will meet at Indianapolis, Jan. 24 and 25. A full delegation and a good meeting is expected.

JAS. H. OREAR, Pres.

The annual meeting of the N. W. Illinois and S. W. Wisconsin Bee-Keepers' Association, will be held in Temperance Hall, Freeport, Stephen-son Co., Ill., on Jan. 17 and 18, 1882. JONATHAN STEWART, Sec.

The Indiana State Bee-Keepers

### Special Notices.

Single copies of the Journal sent postage paid for 5 cents each.

Advertisements intended for the Bee JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts, each, or \$8 per 100.

😭 Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each. ....

When changing a postoflice address, mention the old as well as the new address.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

The Color and Lustre of Youth are restored to faded or gray hair by the use of Parker's Hair Balsam, a harmless dressing highly esteemed for its perfume and parity. 49w4

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sampling they were this effect. by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the leaves in this eiter. are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Rheumatism is the most terrible disease that has ever afflicted humanity, yet it instantly yields to the powerful drugs that Kendall's Spavin Cure is composed of.

Tt would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—
Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list.

It will pay to devote a few hours in getting up a club for the Bee Jour-NAL. Read the list of premiums on another page, and take advantage of the fall gatherings to get up clubs.

It is Worth Remembering that nobody enjoys the nicest surroundings if in bad health. There are miserable m bad hearth. There are miserable people about to-day with one foot in the grave, when a bottle of Parker's Ginger Tonic would do them more good than all the doctors and medicines they have ever tried. See adv.

We have a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied *free*, in any quantity they may be able to judiciously use.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums. Their own subscription may count in the chib:

For a Club of 2, a copy of "Bees and Honey," " 4, - a copy or bees and crossey,

" 4, - an Emerson Binder for 1882,

" 4, - Apiary Register for 50 Colonles,
or Cook's (Bee) Manual, paper, cloth.

6. Weekly Bee Journal for I year, or Apiary Register for 200 Col's,

Or they may deduct 10 per cent in cash for their labor in getting up the club.

Binders for 1882,-We have had a lot of Emerson binders made especially for the Bee Journal for 1882. They are lettered in gold on the back, and make a nice and convenient way to preserve the Journal as fast as received. They will be sent post paid by mail for 75 cents. To all who send during this month (December) for the JOURNAL and binder for 1882, we will send both for \$2.50. We do this to encourage all to get the binder and preserve the Bee Journal for reference, and to save us the expense of removing the name from our type mailing machine, and then resetting it in January or February.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, & Monday, 10 a, m., Dec. 19, 1881.

The following are the latest quotations for honey and beeswax received up to this hour:

#### CHICAGO.

HONEY—The market is lively and prices steady. We quote light comb honey, in single comb boxes, 18@22c; mlarger boxes 2c. less. Extracted

@90. BEESWAX-Prime quality, 18@220. AL. H. NEWMAN, 972 W. Madison St.

#### NEW YORK.

HONEY—The supply is full, and trade is lively, We quote as follows: White comb, in small lookes, 180-22c; dark, in small lookes, 150-17c. Exracted, white, 106-11c; dark, 768-18c. BEESWAX.—Prime quality, 21-26-23c. Thorn & Co., 11 and 13 Devoe avenue.

#### CINCINNATI.

HONEY-Is in good demand here now. I quote: Good comb honey, in sections, is worth 1862/20, on arrival. Extracted, 7690c on arrival. BEESWAX.-1862/20c, on arrival. I have paid 20c, per lb. for choice lots. C. F. MUTM.

#### BOSTON.

HONEY.—1-pound combs are a desirable package in our market, and a large quantity could be sold at 266222c., according to quality.

BEESWAX—Prime quality, 25c.
BUCKERK BLAKE, 57 Chatham Street.

### BALTIMORE.

HONEY,—But little on the market, and prices are not quoted.
BEESWAX.—Southern, pure, 21623c.; Western, pure, 21622c.; grease wax, 11e.—Baltimore Market Journal.

### INDIANAPOLIS.

HONEY.-New, in 1 or 2 lb, sections, 22@25c.-Indianapolis Stock Review.

### PHILADELPHIA.

HONEY.-The supply and demand are alike nominal.

BEESWAX -- Best light 23@25c.-Philadelphia
Merchants' Guide.

### SAN FRANCISCO.

HONEY—A thousand cases, small size, went forward this week by sailing vessel for Liverpool, shipped by a packing itm in this city. The southern coast steamer this week brought 20% cases, Receipts for December to date aggregate nearly 1,000 cases. Inqury is light. We quick white camb, 18020c; dark to good, 1006 14c. Extracted, choice to extra white, 88,0010c; dark and candied, 708c. BEESWAX—230c.25c.

STEAKNS & SMITH, 423 Front Street.

### CLEVELAND.

# The Bee-Keeper's Guide;

### MANUAL OF THE APIARY. By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Illustration

.0' This is a new edition of Prof. Cook's Manual of the Apary, enlarged and elegantly illustrated.

The Brst edition of 3,000 copies was exhausted in about 18 months — a safe unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engrayings - the products of the Honey Bee , the races of bees; tall descriptions of honey producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various

manipulations necessary in the aparty.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "mowith the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical,

Read the following opinions of the Bonk;

All agree that it is the work of a master and of real value—L'Apiculture, Paris. I think Coo't's Manind is the best of our Ameri-can works.—LEWIST, COLBY.

Turnet one S Mannat is the best of our American works.—Lewis T. Colby.

It appears to have cut the ground from under future book-makers.—British Ree Journal.

Prof. Cook's valuable Mannal has been my constant ginde in my operations and successful management of the apiny.—J. P. WEST.

I have derived more practical knowledge from Prot. Cook's New Mannal of the Amary than from my other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having put chassed.—Midd, Far,

To all who wish to engage 'n bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticello, Ill.

With Cook's Mannal I am more than pleased. It

With Cook's Manual 1 am more than pleased. It is findy up with the times in every particular. The richest reward awars its author.—A. E., WENZEL.

My success has been so great as to almost astonish myselt, and much of it is due to the clear, distincted intormation contained in Cook's Manual.—Will, VAN ANTWERP, M. D.

uni.—WM. VAN ANTWERP, M. D.
It is the latest book on the bee, and treats of both
the bee and laves, with their implements. It is of
value to all bee-raisers.—Ky. Live Stock Record.
It is a credit to the author as well the publisher.
I have never yet met with a work, either French
or Toreign, which I hies so much.—L'ABBE DU
BOIS, editor of the Buletin D' Apicutteur, France.

Bots, editor of the Buletin D' Apiculteur, France, It not only gives the natural history of these industrious insects, but also a thorough practical, and clearly expressed series of directions for their management; also a botanical description of boney producing plants, and an extended account of the enemies of bees.—Democrat, Planski, N. Y.

We have perused with great pleasure this rade mecan of the bee-keeper. It is replete with the best information on everything belonging to apiciture. To al taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—Agriculturist, Quebec.
This book is pronounced by the press and leading becomen to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee man will welcome, and it is essential to every mantern in bec-culture. It is handsomely printed, nearly bound and is a credit to the West.—Western Agriculturist.

Free of postage in the United States or Canada Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

### This Number ends Volume XVII.

This number of the American Bee JOURNAL closes the volume for 1881the first year of the Weekly. The enthusiasm caused by its weekly visits is even greater than our most sanguine expectations, and it is exceedingly gratifying to know that our efforts to make an acceptable Weekly paper are so universally appreciated. To all we return thanks for generous encouragement.

It is hardly necessary to say that, for the coming year, we shall devote all our energy, determined to make the Journal even more interesting and instructive than it has heretofore been, if that is within the range of possibilities. Its record, character, power and usefulness, in the past, will be its guarantee for the future, ever keeping in view the one grand object of its existence, that of furthering the interests of honey producers, by losing no opportunity to create a demand for this God-given product, opening up new avenues for its use, creating new demands and eager purchasers, both at home and abroadthus benefiting every honey producer.

In short, the Weekly BEE JOURNAL will continue to be the medium of the best thoughts of the most advanced

the freest discussion, and, by every means in its power, advance progressive bee-culture.

With this issue several thousand subscriptions expire, and as we do not wish to lose any of them, we earnestly invite ALL to promptly renew, and thus save the unnecessary trouble of taking the names from our mail list, and having to replace them again in a few days. Promptness in this will save us much valuable time and perplexity.

Once in a while we receive a rather uncourteous letter because the Bee JOURNAL is discontinued when the time is out that has been paid for. We try to please all our subscribers, but it is not an easy task for us to determine so continued; so we must ask to be informed on the subject.

Now, if all who desire it continued would drop us a postal card, or mention it when they are sending a remittance, it would save us much trouble and themselves the annoyance of having the JOURNAL stopped.

As this is the last article for the year, we commence at one the labors of the new year, stopping but a moment to wish all our readers

### A HAPPY NEW YEAR.

Christmas has come and gone, with its good cheer, joyous smiles and happiness generally. On Christmas eve, the editor received a small box with the following letter from Mr. W. IL Smith, of Burlington, lowa:

I send you by express, charges prepaid, a Christmas present consisting of 2 jars of the nicest honey you ever ate, in my opinion; if you find it so, please report. It is made from willow bloom, and was taken from the second story of the hive last July. It has crystalized and has been again liqui-

Your request for bee and honey report was too early in the season for me. Our bees were gathering honey at that time, and  $\frac{2}{3}$  of it was yet on the bive. We were very successful with our bees last winter, losing a few late in March and April; some starved and some were queenless, making 8 in all, leaving 42, I believe, to commence the season with. From these we obtained nearly 2,000 lbs. of honey; about 600 lbs. being extracted, the balance comb. We increased by nat-ural swarming to 85 colonies; in the meantime we Italianized 18 colonies. Our honey is put up in the most approved plan, and sells more readily than others at fair prices.

apiarists of this age. It will keep have no doubt that it is even superior and each number will have 16 pages. with it, in another column.

abreast of the highest progress, favor to the honey from Mount Hymettus, of which the ancient Grecian Sages wrote—calling it "food for the gods." At least, the honey we have ealen, gathered from thyme on that historically celebrated mountain, did not suit our palate as well. Mr. Smith has our thanks for the honey, and especially for the kind thoughtfulness which prompted him to remember us at Christmas time.

> The Apiary Register will be ready to send out early in January.

It devotes 2 pages to each colony, embracing between twenty and thirty headings, neatly ruled and printed, with space at bottom for remarks, and so arranged that a single glance will give a complete history of the colony. who does and who does not want it Each book will also contain printed rules for the apiary, and twelve pages ruled and printed for an apiary cash account. As each book is intended for a several years' record, it is gotten up on first class paper, and strongly bound in full leather covers. There will be three sizes, sent postpaid, at the following prices:

> For 50 colonies (120 pages).....\$1 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones to procure at the start. We have added these to our new Premium List for getting up Clubs for the BEE JOUR-NAL, as will be seen on page 407.

Send in your orders at once, and the books will be forwarded as soon as completed.

Time Now to Mature Plans for Next Season.—The Indiana Farmer gives the following good advise:

A few colonies of bees, if well managed, will, one season with another, afford sufficient honey for any ordinary afford sufficient honey for any ordinary sized family, besides a surplus for sale. Now while your bees are resting is the time to study up, and mature plans for the next season's work. Good books fully up to the times are within the reach of all. Read upon the subject to be able to avoid the many mistakes made by those who have gone before. For one of the have gone before. For one of the very first requisites toward successful bee-keeping, is a knowledge of the nature and temperment of the bees, and the means by which they are to be governed.

The BEE JOURNAL of next year

How to get the Weekly Bee Journal free of cost for 1882.—Until further notice, any subscriber who desires to obtain a good book on apiculture, can have either Cook's Manual, Quinby's New Bee-Keeping, or Novice's A B C, bound in cloth, postpaid, and the Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, or Blessed Bees (a romance), bound in cloth, for \$2.75. The JOURNAL and all five books for \$6.00. This is a rare chance to get a good library on beekeeping. A person can sell the books for their published price, \$6.00, and get the Weekly BEE JOURNAL free for his trouble.

Those having already paid for the Weekly Bee Journal, for 1882, may send for the books alone and deduct the \$2 already sent for the Journal.

Errata.—On page 397, first column. the last 6 lines of the first paragraph after Mr. Sayles' name, should have been credited to John Hodgson. As it is, it misrepresents Mr. Sayles' views, and was an error of the printer.

Toncerning Ozone, the Sunday School Times remarks as follows:

The advertisement of "Ozone." which has for a few weeks appeared in our advertising columns, was not admitted until after satisfactory correspondence concerning it with gentle-men in prominent official position in Cincinnati, to whom the advertisers referred. Those gentlemen certified tavorably, to the Publisher, concern-ing the preserving qualities of Ozone, and the good standing of those adver tising it.

The BEE JOURNAL twice refused the advertisement, but being assured of the good standing of the Company, as well as of the good qualities of the article, we inserted it a few times, as have some of the best papers in America.

Prof. A. B. Prescott, of the Ann Arbor University, has analyzed the compound and declares that it is not ozone at all, but powdered charcoal and sulphur, with a little cinnamon in it, to give it a pleasant odor while burning.

We give this testimony in justice to our patrons, and advise caution, though the Prentiss Co. Threaten to prosecute any one who may interfere with their business.

The Kansas Bee-Keeper, published by Scovell & Anderson, is to be enlarged to a 20-page pamphlet in 1882, and the price raised to 60 cents a The honey was exquisite; and we will be stitched, the edges trimmed, year. See our new clubbing rates

#### Michigan State Convention.

The 16th annual meeting of the Michigan State Bee-Keepers' Society, was held at Battle Creek, Mich., on Dec. 8, 9, 1881. Pres. Prof. A. J. Cook in the chair.

[Concluded from last week.]

The first evening session opened by Prof. Cook, with his address on "Crumbs Swept up from the National Convention," as follows:

#### President's Address.

Gentlemen of the Michigan Bee-Keepers' Association: When, late last September, your wide-awake Secretary wrote to me that he thought that he could not possibly attend the Na-tional Convention, then soon to meet at Lexington, Ky., and urged that Michigan ought to be represented at that important gathering, I supposed that my duties at the College would ntterly preclude my attending that meeting. But the thought that the State that supports the most prosper-ous society of any State in the Union; that has more district societies than any other State, and, as I am informed by the editor, gives the largest patronage to one of the most influential bee papers of our country; the thought, I say, that this State should have no representative at our National gathering, seemed to me so intional gathering, seemed to me so incongrnous with our position and influence, that I commenced at once to make a great effort to comply with your Secretary's very urgent request to represent this Society as a delegate. Had that gentleman with prophetic vision told me of the great responsities that my course was to been, unon ties that my conrse was to heap these already over-burdened shoul-ders—as the presidential honors, so unsought and so unmerited, would hardly have come to me in my abthe desire even that our State should not go unrepresented, would not have sufficed to secure my attendance at the very interesting ineetings of our National Association.

But it now behooves me to see to it that the rich feast of wisdom spread out before us on that occasion be lost to my friends and brothers of this. our goodly Michigan, and so I have resolved to dish up of the best that was offered there for your edification to-day.

Our enterprising friend Jones showed ns the value of perforated zinc, and told us how it could be used to re-strain swarming at undesirable times. to prevent drones from undesirable colonies flying forth to mate with our young queens, or better, to catch and destroy these useless gormandizers of the hive, and thus save a large amount of honey which would otherwise be consumed. In all of these cases the perforated zinc is used as an entrance perforated zinc is used as an entrance sieve, which, while it will permit the workers to pass freely, is an entire estoppel to the queen and drones. Its peculiar shape prevents it from be-coming a cheek to the ingress and egress of the workers when it is used to fence out the drones. The drones are not able to clog the entrance.

Mr. Jones also uses the perforated zine as a division board during the honey harvest, as he thinks, with exceeding advantage. The queen is kept at the side or end of the hive next to at the side or end of the live next to the entrance, on I or 5 frames of empty combs, which are re-placed by other empty combs as the queen fills them with eggs. Next back of these comes the perforated division board, which keeps the queen from visiting the other frames. Then comes frames of other frames. Then comes frames of sections, or, if preferred, frames for extracting, or both, and last the frames of brood in all stages in the

emptied by the hatching bees emergthat may have been stored in them may have been removed. Mr. Jones there claims that this keeps the swarming they not a fewer in about wayants all breeding in a company of the control of fever in check, prevents all breeding in the sections, and adds vastly to the amount of surplus which may be secured.

Mr. Jones proved this last season that it was easy to ship drones, if we send the brood just before the drones were to come forth from the cells. He by procuring and using superior drones. All other drones can be weeded out or kept from flying by use of the zinc entrances already referred If the males are prepotent among to. If the males are prepotent among higher animals, and such stock improved most rapidly by the selecting of superior sires, why may not the same be true among our bees? Sarely this is a suggestion worthy of consideration.

It has long been known that bumble bees when they mate fall to the ground where the male remains a corpse, while the queen goes forth to her life's work. The similarity of our honey bees to the bumble bees, together with the quick death of the drones when emission takes place from the warmth of the hand, makes it more than probable that the drone honey bee expires in the sexual act. Mr. Jones has seen unwelcome proof of this during the past summer in his experience at his island apiaries. He finds that on island apiaries. He finds that on small islands there are a very large number of queens lost in mating, and that the number is in inverse propor-tion to the size of the island. Of course if the queen and drone fall into the water, the queen would be unable to rise, and so would be lost.

Mr. Della Torre,of Maryland.exhibited a very large queen cell, the queen from which he claimed was the result of the artificial impregnation by him of a drone egg, by the semen of a drone bumble bee. Granting that there is no mistake in this matter, it is an exceedingly interesting observa-It is not, however, the first case of such extreme cross—a cross between different generations has been reported. This report of Mr. Della Torre suggests an interesting experiment that we can all try, and it we Mr. Della succeed, we may have some hope of important results.

There was only one new feature developed in reference to wintering. That was from Mr. O. O. Poppleton, to the effect that fine clover chaff, or better still, line, dry sawdust, was far superior for packing, to any courser material. It seems reasonable that for chaff hives, or for packing, this line material with its liner spaces, would offer better protection.

The "new bees" were freely commented upon. Every one who had personal experience with them, pronounced them superior to the Italians. nounced them superior to the (tanans, All reported that they were more irritable than were the Italians, but all said that with care, they could be handled with no difficulty. The Syrians seemed to be voted superior by those that had tried them both, the Syrians and the Cyprams.

In this connection, let me speak of a new use of the smoker that was sug-gested by Mr. Jones. He turns a little chloroform into a sponge which he then drops into a smoker, and quickly covers with a second sponge. The smoker is then used in the same The smoker is then used in the same way that we would use it to smoke the bees. The vapor effectually quiets the bees, even though they be queenless colonies of Cyprians. Mr. Jones thinks that with chloroform used in this way, we may introduce queens at once and always with the utmost safety. He also makes a similar remark in reference to mitting calculus. mark in reference to uniting colonies.

I wish especially to call your attention to a very neat arrangement for other traines. Then comes frames of the contest of

out top bar. These may hang two or find them only on such fruit as by three deep supported in a similar some chance has been ruptured, shaped piece of hoop iron, which Has there been any such cases tested hooks on to the metal rabbet of the hive, in the main body of the hive, or they may be readily raised and placed in a crate above the hive. In this crate they may be either one, two, or three deep. The advantage of this arrangement consists in the facility with which the sections may be true. with which the sections may be transferred from the body of the hive to the crate above and vice versa, and the ease with which the sections may be removed as soon as they are filled and

was much surprised, and no less gratified, as I listened to the reports of those in attendance at the Convention, to find what a large proportion of the apiarists of the country are principally extracted honey. Three-fourths and more of the honey crop of those present was extracted honey. I might speak of many more valuable points that were brought out at the Convention, but after the many vehement protests against long and numerous essays at these meetings which bave appeared in the bee jour-nals of late, it would show no little tenerity on my part to dwell longer

Before closing however, let me call your attention to a few matters which are. I think, well worthy of your care-ful consideration. First in fixing the place of the meetings, let us not fail to get them as central as possible, and where we are invited to go, so we may have an able local committee, who will spare no pains in making arrangements and arousing a local interest. Much of the success of this meeting is due to our having acted on this suggestion one year ago. You see in the success of the foul brood bill and the adulteration bill before the last legis-lature, what we may hope to do if we really make an effort.

Shall we not, this coming year, strive to secure the organization of still more local or district associations? These organizations tend powerfully to advance the interests of apiculture. All vance the interests of apiculture. All should send delegates to this society, and we in turn to the National Association, that we may all pull together to promote the best interests of our

Above all, I would suggest as the best work that we can do that we send a committee to petition the State Agricultural Society, to give us a building at the next State Fair, and offer sufficient premiums to call out a grand exhibition next fall. Let us ask tor the privilege of selling honey on the ground, and then see to it that there is an exhibition that shall be the re-mark of all who see it, long after they go to their homes. In this way we may create an interest, and build up a market, that shall prove a powerful stimulus to the bee-keeping interests of our State. Let us see to it that our friends in Illinois, and our neighbors across the line, do not eclipse us in this important work.

The Secretary read the following letter from Mr. J. J. Robinson:

I notice that Mr. Cutting is to speak on the subject of "Bees and Grapes." I keep bees and cultivate grapes. Some of my neighbors have grapes, but no bees. They, or some of them threaten to prosecute me if I keep threaten to prosecute me if I keep bees another season. I admit that bees are, to some extent, an annoyance to fruit growers in some seasons. I would be willing to pay something as compensation for the annoyance, but cannot, of course, pay exhorbitant damages

I started last spring with 5 colonies. One party claims \$50 damages on account of my bees injuring his grapes. Grapes sold at 3 ets. per lb. He has but a small portion of the grapes in the community, and 1, but a small portion of the neighborhood. Is there any law on the hood. Is there any law on the subject?

by law? If so, when, where and how were they decided? If I am violating law by keeping bees, I would be glad to know it, and the sooner the better. I shall look with interest for what may be said or done by the Conven-

inay be said of those by the Convention, regretting much my absence.

My bees did well until clover was gone; after that they obtained but little honey. Buckwheat yielded but little honey. The button-ball, so abundant here did not blossom much little honey. The button-ball, so abundant here, did not blossom much this year. I shall put my bees in boxes on the summer stands arranged so there will be an open way clear through under the hive from both sides. I want no upward draft, but plenty of fresh air—not necessarily cold air. I like to have the honey as much as possible above the cluster of

Mr. Cutting: Will be prosecute the woods bees? Mr. Cole said be had 18 acres of

graves, and knows that bees do not injure them.

Injure them.

Mr. Balch said bees are wild, and liable to be killed if they stray. A tame coon if he gets loose may be killed with impunity.

Mr. Heddon: If bees injure grapes, why not move the grapes?

Mr. Harrington recommended alsike

clover for bee pasturage.

Mr. Haike said the seed remained in the ground for years; ½ bushel sows about 6 acres; it remained in bloom about 8 weeks. He thinks he obtained 2 barrels of nice honey from it. Then cut it with a reaper for seed, which netted him \$80.00. It is the best of honey plants. It may be ent twice, and I can get a crop of honey after basswood by having two fields; mow in May, and it will bloom in a man better basswood by having two fields; mow in May and it will bloom in 6 weeks after mowing. It may be sown alone, or with half timothy, 4 lbs. to the acre.

Mr. Southwick: It grows well on

clay; will bloom only once. It won't do much on sandy soil, but will stand as much water as red-top; it will grow 4 feet high.

Mr. Townley corroborated these statements and said it would grow anywhere, and made good hay, 2 tons to the acre.

The President said it was an open question whether queens laid worker eggs that had imperfect wings. He wished those who had such queens would rise up and state conditions. He had probably sacrificed a hundred queens in the effort to sum worker eggs from a queen having elipped wings, and had invariably failed.

Seven stood up.

T. F. Bingham said two such had come under his personal knowledge; one he raised himself had no wings. but laid worker eggs when of the usual laying age. The other was sold to and and worker eggs when of the istal laying age. The other was sold to him with a colony of bees by R. M. Argo. She remained in the same colony two winters, and was a perfect queen in all respects except she was entirely wingless. He said such facts were as well established as that two contracts constitution are found laying in queens sometime are found laying in the same hive at the same time, and that there was not a shadow of

doubt. D.  $\Lambda$ . Jones said he had had three laying at one time in one hive.

The following is the report of the committee on resolutions: Resolved, That while we realize that this meeting is a great success, we would acknowledge our obligations to those who have aided us to make it so. We would tender our thanks to the railfor the four tranks to the language reduced fares; to the Southern Michigan Bee-Keepers' Association for use of room; to Mr. Larken for comfortable accommodations at reduced rates, and to Mr. B. Salisbury for hisarrangements for our convenience. That we also thank those gentlemen outside of our That we also

### EVENING SESSION.

Meeting called to order by James Reddon, the newly elected President, who, in a few well chosen remarks, who, in a few wen chosen remarks, thanked the Association for the honor conferred upon him, and hoped by their assistance, to faithfully dis-charge the duties that may devolve upon him. He then announced the next subject for consideration, which next subject for consumations was "Wintering of Bees."

Pompleton, Williamstown,

O. O. Poppleton. Williamstown, Iowa, stated that about 6 years ago he adopted his present plan of wintering. He believed that this is one of the most important questions with which bec-keepers have to do. He thought there were many elements which enter

into success. His remarks were applicable to lowa, and might not be to Michigan. His summer crop is apt to be light, but his fall crop is generally good. He uses a single story, long, chaff hive, and keeps all combs covered with bees. He extracts thoroughly when at all, but not after Aug. He found the late honey the best winter food. The colonies from for winter food. The colonies from which he extracted from the brood frames wintered the best. When the season is over, he takes out all surplus combs and crowds the bees on as few frames as possible. He destroys his poorest queens in the fall, and gives the bees to other colonies, and was not quite sure that young bees winter the best. Winter passages are in portant. the best. Winter passages are important, and he packs as early as Oct. 1, and gives ventilation above. Uses very fine Timothy chaff: straw is too coarse. The packing should be left on until late in the spring. Honey ripens more rapidly in the brood nest than any where else in the hive; he pays no attention to pollen. Success in bee-keeping depends upon atten-

tion to many details. The President preferred to have his then he bees stop breeding early in the fall, and begin late in the spring, because then no pollen would be used when the bees could not fly. He had seen colonies which had been wintered on white sugar syrup; they showed no disposition to ly after a long contine-ment, when others that had had pollen during the time, were eager to escape from the hive.

Prof. Cook was sure that pollen was necessary to breeding bees, and does not care to have his bees breed before April, and keeps pollen from them during the winter. Any activity during winter is very injurious to bees, and they should be kept as quiet as possible. He winters in a cellar.

Dr. Southard: I use the same kind of hive and use cushions. The air can circulate over them.

Prof. Cook: The Cyprians should be packed early, before they are through authorized house.

through gathering honey.

Pres. Heddon said one of his neighbors wintered his bees well by remov ing the center combs and left the fall honey. This plan removed the pollen

that the bees store in the center in the fall.

B. Walker mentioned a colony from which he extracted all the early honey intending to feed, but over-looked them. They had lots of pollen but died without disease, while others

died without disease, while with lots of honey had disease. Pres. Heddon: Pure sugar syrup renders bees comfortable.

Dr. Southwick's died from dysentery and starved also.

Prof. Cook said they analized sugar and fed it in empty frames. They stored the combs having pollen. The bees started breeding but soon stopped. He felt sure they cannot breed with-out pollen. We take away all the pol-len, but give it back in the spring. He does not want them to breed in the winter.

Mr. Townley said if you go to the

cellar and find the bees quiet, you can be quiet too. We make statistics slowly—have only 12 colonies. The following by Charles F. Muth,

Cincinnati, was read on

#### Wintering of Bees.

Several conditions are essential un-

are the conditions reported under which bees have passed a winter in safety. These, put up again in the same manner, were lost the following winter. Among the colonies of an apiary prepared in the same manner, the same party, we find sometimes in spring a strong, splendid colony by the side of a weak one, which had been, in fall, in better condition than its now vigorous neighbor. A friend had his 40 colonies of bees in two rows, and during a severe winter, 10 or 12 years ago, he lost every one of them but the four end colonies, the very ones which were exposed to wind and weather most. His bees had died and weather most. His bees had died of dysentery, my friend said, and so they had, but dysentery was caused by they had, but dysentery was caused by eating sour honey, which, again, was the consequence of a damp, warm hive, otherwise the combs would not have been so moldy, nor the insides of the hives so wet. He had his bees cov-ered up warm and tight, with straw under the hives and between them. Had each hive been properly ventila-ted, this dampness would not have acrumulated and his bees would have

One of the most essential conditions one of the most essential conditions for good wintering, next to a good colony of bees, is undoubtedly a suffi-cient quantity of good honey, in the proper place, ε, c, in the middle of the hive, and within easy reach of the cluster. I do not believe that fine clover honey is more wholesome for bees than fall honey, nor that all must be capped; but if your hive is insufficiently ventilated, your uncapped honey is the first to sour, and the bees get dysentery earlier than they other-wise would, while with proper venti-lation, there would be no sour honey

and no dysentery.
We can keep honey in open vessels in a garret, or in a warm, dry room, in good condition forever, while it sours in a damp cellar. By the efforts sours in a damp cellar. By the efforts of the bees to create the necessary heat in winter, their exhalations, unable to escape, condense into water, which hangs in large drops under their top covering until it runs down the combs, the walls of the hive, and out in front. The hive is worse than a damp cellar. Should we expect honey to keep or bees to prosper under such There is an abundance conditions ? of hives in the same condition every winter, as every observing bee-keeper knows, and, what is worse, we

them sometimes in our own apiaries.

The next essential condition for ev erything that breathes is pure air, and bees are no exception to the rule. As soon as we learn the art of providing our hives with the proper upward ventilation, so as to have the moisture removed and the air renewed gradually without causing a draft through the colony, we will have advanced considerably. No difference how well the hives are covered with absorbing material, it will amount to nothing unless we provide ventilation above. A tightly filled, thick, chaff cushion is as bad as a tight wooden cover or an is as ban as a right wooden cover of an oil-cloth, because it will retain the moisture in spite of the air passage above it. But chaff put on loosely, or a straw mat (I prefer the latter), are good absorbents and non-conductors. and answer the purpose admirably.

Bees can create a great amount of heat and withstand severe cold, but the longer the cold spell lasts, the greater should be the ventilation by the air-space above the covering. long as frost is visible in the ventila-tors or upper stories provided for ventilation, so long is the ventilation instaticient. A different protection is necessary under different surroundings and in different climates, as a matter of course; but until we learn how to provide our bees with pure air now to provide our bees with pure an properly, we shall always be in trouble as to the best mode of wintering.

I provided air-passages, this fall, by boring an inch hole in each side of the

upper story near the cover.

Cincinnati, O. Chas. F. Muth.

Mr. Harrington said that in Ohio Several conditions are essential unlinear his home, there was a certain Mr. Heddon said der which bees can winter safely; but wild flower that was sure death to laid on the hives.

laughable somtimes and contradictory | bees; the honey from it ferments before the bees can store it. One tleman lost his bees last spring from too early breeding.

Mr. Jones said that dampness and dysentery were most to be dreaded; the former is frequently the cause of the latter. Bees will winter if dry and well provisioned.

Mr. Townley believed that dryness is necessary.

Mr. Jones had found fine dry saw-

All, Johes had been absorbing material.

Pres. Heddon read part of a letter favoring the removal of pollen.

Mr. Herd, of Saginaw: I have no upward ventilation—no passages through the combs—none die. I have practiced the same plan of wintering for 5 years. Never put a colony up so that did not live. He has 50 colonies; he fed rye flour in the spring. The cold snap in April killed 15.

B. Walker: I. dan't. take nearly

I don't take much B. Walker: stock in honey causing sickness; I removed the pollen, but lost all last

Mr. T. F. Bingham read a paper entitled "Hints." If you find open titled "Hints." If you find open cells in solid honey (that is all open) it is a hint that the honey is thin, or not very well ripened. If you open a shallow frame hive and raise the mat carefully, a stir will be seen some-where on the top of the frames, it is a hint that the queen is just below; and if you wish to find her, examine the two combs each side, and you will find her at once. Deep frames will not show this. When bees suddenly stop swarming, it is a hint that the special flowers on which the swarming began is on the decline, and the surplus capacity is to be narrowed, so as to avoid partially filled sections.

The matter of petitioning the State Board of Agriculture, suggested by Pres.Cook, was referred to committee.

Mr. Jones explained his method of waxing sections with a revolving wheel. In reply to the question, which paid best, the getting of extracted honey, or honey in the comb? I use the extractor exclusively. also chloroform bees in introducing queens. I place a small sponge filled with chloroform in a bellows bee smoker, and blow it into the entrance of a hive until the bees are still and could then let the mean run in at the quiet, then let the queen run in at the

Mr. Heddon remarked: The chloroform is taken into the circulation, and did not think it should be used.

Dr. Southard sustained the opinion. Prof. Cook thought Mr. Heddon Prof. Cook thought Mr. wrong, and requested Dr. Kellogg to

explain:
The Doctor stated that its repeated use on human beings was deleterious. The blood must be saturated with it hence it takes time to recover. The effect is to benumb the nerve centers. Prof. Cook thanked Dr. Kellogg for his last winter's service in helping to bring the adulteration matter before the Legislature.

The question box contained the following: "Can bees be made to swarm when no honey is coming in?" Answer by Mr. Jones—Yes.
"How can bees be prevented from swarming?" Mr. Heddon thought

that it was generally best that they should swarm, but could be prevented by keeping an abundance of empty cells for the queen's use

"How the queen is ase."
"How can a drone-laying worker be disposed of?" Mr. Townley said to remove the hive to a distant place and put a hive having a good queen in its place. Mr. Harrington gives the colony a good queen. Mr. Andrus could find and remove. Others could not

detect them.
"Can we be compelled to remove bees from a city?" Mr. Miner had looked into the subject, and learned that they could be removed if they were proved to be a nuisance.

How can bees be handled when neither smoke nor sweetened water will subdue them?" Answer—Use puff-ball or sprinkle them with water.
"Is shade necessary for bees?" Mr. Heddon said yes; I use a board leid on the bives.

" How can we get drones only from our best colonies?" Answer by Mr. Walker- Put drone comb in the hive from which you wish to get the

drones.
"In cellar wintering, is it best that hives should be near the floor?" Answer by Mr. Robinson—Yes, if the room is dry. Mr. Jones had found that the air near the bottom of the oom is injurious to bees unless ventilation is good.

The committee on delegates reported 45 gentlemen from other States and 92 delegates from other societies.

committee was appointed on establishing a society in the south-western part of the State, and one for the northeastern part of the State

The committee on exhibits reported large display, which included the

following:
James Heddon, of Dowagiac, exhibits 3 kinds of foundation, Vandervort, Dunham and Given; also spruce dovetailed sections, and honey how his feeder bearing and honey spruce dovetailed sections and honey box, his feeder, honey jars (3 sizes), Given comb foundation in wired frames, Parker's foundation fastener and tin pail for honey.

J. D. White, of Massachusetts, exhibits a feeder built on the same principle as the Shuck, as is also Mr. Heddon's.

Mr. Formerook of Wisconsin shows

Mr. Fornerook, of Wisconsin, shows

Mr. Forncrook, of Wisconsin, shows a lot of one-piece sections, both in the flat and put together.

Mr. D. A. Jones, of Beeton, Ont., exhibits a lot of japanned cans for marketing extracted honey, varying in capacity from ½ to 5 lbs. each; a package of Bokhara clover seed, a package of Bokhara clover seed, a refrigerator model for regulating the temperature of winter repositories for bees, sheets of perforated metal for separating the brood nest from the surplus frames, and to regulate the entrances to hives; a lot of honey labels, and an improvement on the Langstroth style of frame, and a model for illustrating a new style of

hive for wintering out-doors.

Prof. Cook exhibits an instrument measuring the length of

tor measuring the length of the tongues of different races of bees.
Mr. Hanghey and Mr. Saulsbury each exhibit chaff hives, and Mr. Haughey an observatory hive.
M. D. Weeks, of Homer, cans of outerated home.

extracted honey.

Mr. Cutting, a feeder, L. C. Root's

smoker, a frame of foul brood, and a collection of bee periodicals and books.

T. F. Bingham, of Abronia, Mich., Bingham smokers of various sizes, and Bingham & Hetherington honey knives. Dr. Whiting, a reversible frame supposed to combine the advantages of the Langstroth and Onible frames and the supposed to combine the advantages.

Vantages of the Langstrom and Quinby frames, and to avoid their defects, the mvention of Mr. Vandeusen, of Sprout Brook, N. Y.

Mr. A. I. Root, of Medina, O., a number of articles to be used in transporting bees by mail and express, a banay scale, atc.

a honey scale, etc.

W. B. Southard moved a vote of thanks to T. G. Newman, A. I. Root, D. A. Jones, H. B. Harrington, Medina, Ohio, which was carried unanimously.

Sixty-three new members were Sixty-three new members were en-rolled, and Thomas G. Newman, Chi-cago, Ill., A. I. Root, Medina, Ohio, D. A. Jones, Beeton, Ont. Can., and J. H. Townley, Thompkins, Mich., were elected honorary members.

Mr. Newman stated that large exhibits at State fairs produced good results. In London at the exhibition of the Royal Agricultural Society, American honey received the first premium. Every one wanted it. The streets and avenues were crowded to see American honey, and it sold rapidly at 60 ets. per lb. To see it was to covet it. He recommended the offering of large premiums for exhibits of honey, and this would command large exhibits.

Pres, Cook suggested a committee to take into consideration the exhibi-tion of bees and honey at the Michi-

gan State Fair in 1882.

Mr. Newman said bees were shown in London in a round tent with an

open top. In St. Joseph. Mo., they were exhibited in one end of an upper room which was separated from the main room by mosquito net

The President appointed the following gentlemen a committee to secure a good display at the Fair: II. D. ing gentemen a committee to secure a good display at the Fair: H. D. Cutting, Clinton: A. B. Weed, Detroit: Dr. O. B. Ranney, Kalamazoo; James Heddon, Dowagiac; Byron Walker, Capac, and J. H. Robertson, Pe-

A resolution was passed extending an invitation to Dr. Nugent and Mr. Jones, Ont. Can., also T. G. Newman and A. I. Root, to be present at our contamonal mosting. next annual meeting.

The Forncrook patented one-piece section box caused a long discussion. The patented point was questioned, and Mr. Forncrook explained that it was the fact that the box was made of a single piece of wood. He said that all persons who had on hand secthat an persons who had of hand sec-tions that were an infringement of his patent at this date, might use them; but all infringements occuring after this date, would render the infringer liable to prosecution.

The meeting was characterized by

a warm interest which extended to all those present. About 75 new mem-bers were added to the Association. Adjourned to meet at Kalamazoo,

December, 1882.
T. F. BINGHAM, Sec.

For the American Bee Journal.

### That Adjourned Meeting.

MRS. L. HARRISON.

The adjourned meeting of the North The adjourned meeting of the North American Bee-Keepers' Society, did not meet as anticipated in Maumnot Cave, but had a delightful session in a cab. The States of New York, Kentucky, Illinois, Missouri, Wisconsin and Georgia were represented. A recess was taken when the vehicle reached Ashland, the former home of Kentucky's great Statesman, Henry Clay. A few souvenirs were gathered, and the meeting convened until the stock farm of General Withers the stock farm of General Withers was reached. This session was de-lightful, as the weather was off the very best piece, the air soft and balmy, and the pike smooth and level, without being dusty. We viewed from the windows of the cab a magnificent building with a grand cupola, and a large stained glass window in front. Some of our party remarked that it was a church, others that it was a dwelling house. On alighting, it was found to be a horse hotel, with all the modern conveniences. It was an ar-cade with an asphaltum drive-way, and separate apartments for each occupant on each side, and linished in hard wood of dark and light wahnut. These departments were supplied with fresh water, and the table d'hote was supplied from the store-rooms above through sliding doors and sponts; light was admitted through stained glass of delicate blue and gold, as beglass of dencate blue and gold, as being best suited to the vision of a horse.

1 wish the architects of halls and churches would visit this building, and take a lesson on ventilation. The General remarked that "his house was not so well ventilated;" but then horses of annamed value are of more consideration. consideration than human beings.

consideration than human beings.

We viewed with pleasure the many fine horses led out for our inspection, and while doing so, the General said, "my father lived to be 90 years old, and always ate at every meal a small quantity of honey." We again convened in the cab, and were driven quickly to the cemetery to view the last resting place of Henry Clay, and of John Morgan, the famous raider, who knew so well how to ride. The monument erected by the State of Kentucky over the remains of Henry Clay, is a magnificent one, and his

ing much reduced), and we were driven to the stock farm of Dr. Hert to view the fine stock congregated there. Words fail me to describe the mag-

Words fail me to describe the magnificent animals we there saw, and we recall with pleasure the happy moments we spent while rubbing the velvety noses, and patting the sleek sides of these superb creatures.

The National Bee-Convention of 1881, is one of the happy events of our life, and we shall always feel grateful to Mr. & Mrs. Williamson for their hospitality, and to the people of Lexington for their many courtesies extended to us while there.

Peoria, Ill.

Peoria, Ill.

Losses Recovered .- The thermome-Losses Recovered.—The thermometer indicated 46° at moon to-day. Bees flew a little. The losses of last winter are well over-come by the good management of summer and fall. The bees are strong and in good condition.

J. E. Breed.

Embarrass, Wis., Dec. 16, ISSL

Bee-Culture in Georgia.—I cannot be without the Bee Journal. My 34 colonies are all doing well so far. I have some fine Italians and aim to increase largely the coming year. I am determined to make my bees pay me something before I am done with them. There is no other person in this section paying any attention to bees. I cannot get any of them out of the old plan of log gums. They say, "talk to me about one queen laying all the eggs for a colony; it is all "talk to me about one queen laying all the eggs for a colony; it is all bosh." But they are beginning to notice that I am the only man in this locality that is having any success. They will wake up sometime. I will send you a sample of some of my cotton honey. I think it will equal the white clover honey. I took 80 lbs. from one hive as fine as I ever saw.

H. M. Williams, M. D. Bowdon, Ga., Dec. 14, 1881.

Must Have the Weekly.—I like the shape of the BEE JOURNAL much better than last year. It is better for handling and binding. I do not see handing and dinding. I do not see how I can get along with any less than the Weekly, and enclose \$2 for it. John H. Hodgkins. Shirland, Ill., Dec. 20, Iss1.

A Mild Winter.—The winter here up A mind wither.—The winder here dy to this date has been extraordinarily mild, with lovely weather. There has been very few days in the middle of the day that bees have not been fly-ing. Of course they consume more honey, and the greatest danger that I anticipate to the bee-keepers of Ken-I anticipate to the bee-keepers of Kentucky, will be a backward spring with stores exhausted and colonies weakened. The only safeguard will be early and constant feeding.

W. WILLIAMSON.
Lexington, Ky., Dec. 17, 1881.

Honey in Glass Jars for Home Market. -Glass jars for honey are not dead but asleep. Mrs. Harrison labors but asleep. Mrs. Darrison labors under a mistake when she tells us that honey put up in glass jars and tumblers are killed too dead to bury. Honey put up in Mason fruit jars is more attractive and pleasing to the eye than any other form, and of necessity must be clear and clean. Nice clean sections are hard to beat, but many of my outstmans under alassal.

statue can be viewed from a great part of the city of Lexington.

The next morning a short session was held in the cab (our members because in the cab) and are therefore most attractive. 2. Glass is durable and more easily kept clean. 3. They are easily opened to clean. 3. They are easily opened to prove the quality of the contents, and last, but not least, are lasting (unless broken), and therefore are worth the cost price for other purposes. This season I retailed quarts at 65 cts., and pints at 35 cts.; tumblers at 25 cts. My extracted honey thus net une over 18 cts. per lb. I commenced with 10 colonies last spring, and have sold to this date \$171.49 net exclusive of jars.

II. S. HACKMAN. season I retailed quarts at 65 cts., and pints at 35 cts.; tumblers at 25 cts. My extracted honey thus net me over 18 cts. per lb.—I commenced with 10 colonies last spring, and have sold to this date S171.49 net exclusive of jars.

H. S. HACKMAN.

Pern, 1ll., Dec. 19, 1881.

Weekly More Acceptable than a Monthly.—Please mark my name as a life subscriber to your most excellent paper. 1 do not want to miss one number. 1 would not have it go back to the monthly again; at twice its present price, it would be more acceptable than a monthly. God bless your efforts, Mr. Editor. You are elevating our noble cause, and educatevaling our home cause, and educating the fraternity to a higher standard. I say "amon," to your war upon glucose and its advocates.

F. C. Benedict.

Perry Centre, N. Y., Dec. 18, 1881.

Double Walled Hives. - My bees are bouble Walled Hives,—My bees are flying lively to-day. I am a beginner in bee-culture, only having been in the business about 3 years. My enthusiasm increases in proportion to the knowledge obtained of the science. I have but 14 colonies of bees; my aim at the start was to go slow. When I at the start was to go slow. When I feel that I am master of the situation. I shall obtain more bees. Being a car-penter, I make my own bee-aparatus. In my opinion, in-door wintering in Southern Ohio is unnecessary with a properly constructed hive. I use the southern Onto is unnecessary with a properly constructed hive. I use the standard Langstroth hive, double walled, half in dead-air space all around, quilt over frames, cap a duplicate of brood chamber, except onter case; cleats are nailed to the bottom of cap to form a projection, or rather a covering of double walls below. The cap has a movable cover. I constructed my hive for the purpose of obtaining either comb or extracted honey, as I may desire. I live within a construction of Athore the county seat and a miles of Athens, the county seat, and own 2 acres of land, having on it a great variety of fruit, also a carpenter shop with cow stable underneath it. Shop with cow stable underheath R. But little plowing is done in this neighborhood. Sheep growing is our specialty. White clover and basswood are our best honey producers.

B. S. Milles.

Athens, O., Dec. 18, 1881.

A Suggestion.—A report from each State where bees are cultivated, similar to the following, would be of much interest to bee-keepers: In the month of November our bees were on the wing 23 days. The last pollen was brought in on the 18th. On the 13th pollen of 3 colors was brought in 1-red, white and yellow. The lowest dip of the mercury was 16 above zero F, and the highest temperature was 74%. The ground was white with snow F, and the highest temperature was 74°. The ground was white with snow a few hours on the 22d. It is too soon to speak for the whole of December, but 20 days have passed, and our bees have been able to stir in the open air 10 days. The lowest dip was 29°, and the highest temperature was 68°. The loss of old bees by the first shock of winter was musually small. winter was unusually small. G. W. Demarker. Christiansburg, Ky., Dec. 20, 1881.

We viewed with pleasure the many fine horses led out for our inspection, and while doing so, the General said, "my father lived to be 90 years old, and always ate at every meal a small quantity of honey." We again conquickly to the cemetery to view the fast resting place of Henry Clay, and of John Morgan, the famous raider, who knew so well how to ride. The monument erected by the State of Kentucky over the remains of Henry Clay, is a magnificent one, and his fruit jars for honey for the following long and strangerist and pleasing to the to overhaul your caps, especially it to overhaul your caps, especially it to overhaul your caps, especially it to overhaul your caps, especially it to overhaul your caps, especially it to overhaul your caps, especially it to overhaul your caps, especially it to overhaul your caps, especially it winter quarters. It is surprising what the invest containing the bees are in with the lives containing the bees are in winter quarters. It is surprising what the roofs. Most bee-keepers know hat an annoyance it is to find your nearly of the hives containing the bees are in winter quarters. It is surprising what the roofs. Most bee-keepers know hat an annoyance it is to find your nearly of protects the honey from dust and strangers' hands, from getting bruised, etc. I always sell my honey in Mason fruit jars (this season some in jelly glasses), with the best and most satisfactory success. I use Mason glass fruit jars for honey for the following I have found an excellent plan to stop order of Executive Committee. Leaky Hives .- Now is a good time

the cracks between boards, especially the small ones, that paint and putty will not readily fill, by simply pressing a string of suitable thickness into the

Good Increase.—I must have the BEE JOURNAL as long as I keep bees. I had no success with my bees last winter. I put 24 colonies in the cellar, and by the 1st of May I had only I weak colony left. They had plenty of honey. Some of the hives had 50 lbs. of honey. I bought 6 Italian queens and 6 lbs. of bees, and they built up to good colonies.

I. C. Peter.
Greenleaf, Minn., Dec. 10, 1881.

Plentiful Crop.—I have 135 colonies of bees in the cellar. I commenced with 80; some were weak. They gave me 4,000 lbs. extracted, and about \$100 worth of comb honey.

Lewis W, Sarles. Foxboro, Ont., Dec. 14, 1881.

### Local Convention Directory.

Time and Place of Meeting. Jan. 10-Cortland Union, at Cortland, N. Y. C. M. Beun, Sec., McGrawville, N. Y. 10-Eastern N. Y., at Central Bridge, N. Y. N. D. West, Sec., Middleburgh, N. Y.

### Special Notices.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each. ....

When changing a postoffice address, mention the old as well as the new address.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

The Color and Lustre of Youth are restored to faded or gray hair by the use of Parker's Hair Balsam, a harmless dressing highly esteemed for its perfume and purity.

49w4

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

F It would save us much trouble. if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.— Also, if you live near one postoffice and get your man at another, be sure to give the address we have on our list.

It will pay to devote a few hours in getting up a club for the Bee Journal. Read the list of premiums on another page, and take advantage of the fall gatherings to get up clubs.

....

It is Worth Remembering that noof the grave, when a both of Parker's Ginger Tonic would do them more good than all the doctors and medi-cines they have ever tried. See adv.

We are sometimes asked who We are sometimes asked who our authorized agents are? Every subscriber is such an agent; we have no others, and greatly desire that each one would at least send in one new subscriber with his own renewal for 1882. The next few weeks are the time to do this. We hope every subscriber will do his or her best to double our list for 1882. our list for 1882.

Premiums. - Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2.-a copy of "Bees and Honey." 3,-an Emerson Bunder for F 4, -an Emerson Binner for the state of the s " 5.- " cloth.

" 6.-Weekly Bee Journal for I year,
or Apiary Register for 200 Col's.

Or they may deduct 10 per cent in cash for their labor in getting up the club.

Binders for 1882 .- We have had a lot of Emerson binders made especially for the BEE JOURNAL for 1882. They are lettered in gold on the back, and make a nice and convenient way to preserve the JOURNAL as fast as received. They will be sent post paid by mail for 75 cents. To all who send during this month (December) for the JOURNAL and binder for 1882, we will send both for \$2.50. We do this to encourage all to get the binder and preserve the BEE JOURNAL for reference, and to save us the expense of removing the name from our type mailing machine, and then resetting it in January or February.

🕼 Binders cannot be sent to Canada by mail-the International law will not permit anything but samples of merchandise of less weight than 8 ounces. Canadians will please remember this when ordering Binders.

Look at the wrapper label and see that proper credit is given for money sent us, within 2 weeks. If it does not then appear, please send us a Postal Card, and we shall with pleasure make the correction, for an error may occur during the rush at this season, though we endeavor to be careful to always give proper credit.

If any numbers of this years' BEE JOURNAL have been lost, look them over at once and send us a Postal Card stating the missing numbers and we will send them free, as long as we have any left.

Of the many Guides and Seed and Plant Catalogues sent out by our Seed and Nurserymen, and that are doing so much to inform the people and beautify and enrich our country, none are so beautiful, none so instructive as Vick's Floral Guide. Its paper is the choicest, its illustrations handsome, and given by the thousand, while its Colored Plates are gems. This work, although costing but ten cents, is handsome enough for a Gift Book, or a place on the parlor table. Published by James Vick, Rochester,

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

OFFICE OF AMERICAN BEE JOURNAL, A Monday, 10 a. m., Dec. 26, 1881.

The following are the latest quotations for honey and beeswax received up to this hour:

#### CHICAGO.

HONEY -The market is lively and prices steady.

We quote light comb honey, in single comb
boxes, 18622c; in larger boxes 2c, less. Extracted

BEESWAX -Prime quality, 18st 22c. Ab. H. NEWMAN, 972 W. Madison St.

#### NEW YORK.

HONEY—The supply is full, and trade is lively.
We quote as tollows: White comb, in small boxes, 180-202; dark, in small boxes, 150-17c. Exracted, white, 100-11c; dark, 70-19c.
BEESWAX.—Prime quality, 215-50-23c.
Thorn & Co., 11 and 13 Devoe avenue.

#### BOSTON.

HONEY.—1-pound combs are a desirable pack-ge in our market, and a large quantity could be old at 200-200, according to quality. BEESWAX - Prime quality, 25c. CROCKEM & BLAKE, 3 Chatham Street.

### BALTIMORE.

HONEY.-But little on the market, and prices are not quoted.
BEESWAX.-Southern, pure, 21ce 23c.; Western, pure, 21ce 22c.; grease wax, 11c.-Baltimore Market Journal.

### INDIANAPOLIS.

HONEY.—New, in 1 or 2 lb, sections, 22@25c.— Indianapolis Stock Review.

### PHILADELPHIA.

HONEY,-The supply and demand are alike nominal. BEESWAX - Best light 23@25c.-Philadelphia Merchants' Guide.

### CLEVELAND.

HONEY-Comb honey has been a little dull for a week, but prices are unchanged. We sell best winte 1 lb. sections at 22c; 2d best, 20c, and dark lsc; 2 lb. sections, 176/20c. Extracted, 12c. in small packages; 11c, in half bbls. BEESWAX-220025c. A. C. KENDEL, 115 Ontario Street.

### ST. LOUIS.

HONEY-Plentiful and slow for all save choice tright comb this sold readily; comb at 18622c; trained and extracted 9641c; to 129c, top rates or choice bright in prime packages.

BEESWAX-Selling lightly at 19620c.

R. C. GREER & CO., 117 N. Main Street.

#### SAN FRANCISCO.

MONEY—The sonthern boat this week brought 168 cases, principally comb. It is next to impossible to find buyers at current figures, except where a compared to the sont to impossible to find buyers at current figures, except where a compared to some small dealer. There would be no trouble in placing all offerings to wholesale hypers, if concessions were made, but this holders are endeavoring to avoid, at the same time being anxions to realize. We quote white comb, 1602/10c, dark to good, 1006, 14c. Extracted, choice to extra white, 83,00 luc, dark and candied, 700c. BEESWAX—2302-10c, STEARNS & SMITH, 423 Front Street.

### CINCINNATI.

CINCINNATI.

HONEY—Our honey trade is a little slow just now, perhaps because of the unfavorable weather; but it has been first-class. My sales during two weeks in the month of more specified was during two weeks in the month of more specified was a considered to ever sold in two distributions. About 15,000 lbs. of extracted before. About 15,000 lbs. of the hance in our square pound jurs, and almost all the labore in our square pound jurs, and all those latter, with the exception of about 10 gross, were said in our eity, party in slapping orders and party in the handsomest retail packages. They do not sell in Chicago nor in New York because adulterators have spoiled the retail trade especially for extracted honey. They used glass jurs. But I doubt very nineh whether I should have created a retail market for extracted honey with the same success had I not adopted the square glass jur. I adopted it because adulterators were using the round bottless. For Hoand 25 lb, packages nothing is handler from drugarsts, lasters, retail grocers, etc.

1 pay 80 He, for extracted honey on arrival, and BEESWAX. 1860 220c., on arrival. I have paid 25c, per lb, for choice lots.
